Now Tom and Jim can't figure out why the good customers from the past aren't coming in anymore to buy programs. Then they get a copy of the file listing that I got on my BBS. Suddenly, it all becomes too clear to them. The reason no one is buying is because the darn things are being given away free on the pirate BBSes around town. Hey, why the hell pay $199 for PageStream when you can spend an hour downloading it for free? Same for Space Ace, Dragon's Lair and all the other tons of "freeware" available on the pirate BBS.

Put yourself in Jim Jenkins' shoes. You own a store that sells computers. Your prices from Atari give you a minimal margin, so you must make your true profits in selling software. (Go ask Tom or Jim what they pay for an STe. You'll laugh at the chintzy amount they make on each one sold.) You have to pay overhead, and you have to keep just enough in the bank so that you can order new items when they become available. (Plus it's also nice to eat once in a while as well.)

In one month, you sell just *ten* titles of ST software. Ten! I never was real good at math, but that don't pay the piper. If you were Jim, wouldn't you wonder why support from the users has dried up? And wouldn't you be a little more than a bit pissed off when you find one of the "stalwarts" of the ST community in El Paso is running a pirate board, out of his house, with more than $4000 in game software alone on it? *And,* on this BBS, there are games and programs available that your software distributor hasn't even heard of yet?

Unmoving Inventory

You go over to your inventory, and you see the $199 version of PageStream sitting there, gathering dust, and it become obvious what is going on. And the 10 copies of Dragon's Lair, and the 15 copies of Space Ace and the two copies of ChronoQuest II, and Hammerfist and Klax. All are sitting there, gathering dust, eating up space. And yes, money, because something that is taking up display space is eating money if it isn't "moving." This jerk, running a pirate BBS out of his home as a "hobby," or as he sees it, a "public service," is denying you your livelihood.

This one person, by giving away the things you are trying to sell, is essentially destroying your business. (Hey, no matter what you may think about Jim and Tom, they are still people doing their darndest to try to make a living. They have kids and wives and mortgages just like all of us.) Well, I don't know how you would react, but I sure as hell would be mad.

Move Out of Atari

Okay, so what do you do? Well, you can't turn the guy's BBS off, even though you can send his name and number to a few well placed folks. You do what is *the only sound business move:* You start selling less and less Atari software.

It only makes sense. Start selling more and more IBM software and IBM machines. I have been going into Jenkins' for the best part of four years now, and I can tell you, what once was an idea about selling clones is now something that takes up half the store. Long time ST Club members will tell you about the times gone by when Jenkins' was a true "Atari dealer."

Now, the areas for the ST, STe and ST software are growing smaller and smaller. Why stock something everyone in town has a copy of anyway? *And* that is where the pirates are hurting you, whether you realize it or not! Because eventually, Jenkins' and every other dealer that sells ST software is just going to throw their hands into the air and say "To hell with it. If the pirates want the business, they can have it." (I know you have been into Jenkins' or your own local store, looked at the selection, and said to yourself "Geesh, they have had that program sitting there for two years. Don't they get any NEW stuff?")

Fewer and Fewer Local Dealers

And so, Atari software and hardware support in El Paso will dry up faster than a puddle in the west Texas sun. So what if you want to have your computer fixed? Well folks, if Jenkin's stops, folks in El Paso would have to drive all the way to Tucson, Arizona. Why would they stop repairing STs? Simple: No money in it.

No money in a machine that is a great machine, but you can't sell any software, which is *the bread and butter of any computer store. You can't make a profit.* Clones are the way to go.

Go in and ask Tom or your local dealer how many IBM software packages they sold last month. Then ask them how many ST packages they sold. You will be shocked. But please, don't be shocked when they stop selling ST software. You should have seen it coming.

And tell the guys that run those "public service" BBSes how thankful you are that you have to drive for half a day (if you're lucky) to get a new game or to replace Wordwriter with Word Perfect.

If you think this problem is localized to El Paso, think again. Those clever Medway Boyz are everywhere. And so are the BBSes. I can write about the problem because I have firsthand knowledge of the BBSes and of Jenkins' Computers.

Next time you come across a friend who has "a great new copy of a game" he wants to give you, think again. The short term gain is not worth the long term loss of Atari support, dealers, and Atari computers.

SOFTWARE PIRACY hurts BIG companies.

But it *KILLS* small companies.

Have you ever heard this rationalization for stealing? "Big software companies aren't hurt by one or two pirate copies of their programs."

Well, the truth is that many of the best Atari software houses are NOT big companies -- they're small businesses with few employees. Many of the best programmers and developers are Atari enthusiasts like you. And the loss of just a few sales due to software theft can help drive them out of this comparatively small market.

The next time you're tempted to give or receive a copy of a commercial program, consider how piracy affects Atari software developers and the future of Atari computers.

Atari Developers

Down with Shareware!

Jay Skotcher (WAUG)

I recently read Craig Harvey's article about shareware. It was a good article, but it discussed the problems of shareware from an abstract/moral standpoint. I feel some major concrete problems exist with shareware users which authors will need to address before the situation improves.

The first problem with shareware is the name. When we share we don't expect to pay or get paid. Think about the last time you shared anything with a friend. Did you ask for money?

The name, Shareware, implies the programmer's motive for writing the program wasn't necessarily for profit. Some users of shareware feel: "The author wrote this software for his own use because he didn't like the features of the available software or it didn't exist. He is now *sharing* his programming efforts with the rest of the world." Then comes the insult. "Why should I pay for this program? He's sharing it. He would have written it anyway." Shareware needs to be renamed.

The second problem with shareware is giving away completely running fully functional programs. An earlier version of Craig Harvey's Diary program appeared on the AIM disk of the month.

It's a fine program as it appears on the disk. So well done, anyone using Diary and liking it has no incentive to register. Why did he ever allow it to save files? It would run fine without this ability. If the shareware version did not allow saving files a user would be able to test drive all the interesting features but still have some incentive to register his copy.

The third problem with shareware is the way it is marketed. Here is a paraphrase of how Craig explained shareware. "Here is a piece of software. Try it for 30 days. If you decide to keep it send your money to..., otherwise destroy your copy." Does this sound like a smart way to profitably market a product?

Let's apply this same marketing scheme to a car. "Here is a Lamborghini Countach. Try it for 30 days. If you decide to keep it send your money to..., otherwise destroy the car." Doesn't this sound silly? I hear a few saying, "That's stupid. He's comparing cars to software."

Who's being stupid? A car can be repossessed. I haven't yet heard of any shareware author who has been able to repossess an unregistered copy. Just for fun let's apply this strategy to something more similar to software, a CD. "Here is a Compact Disc of your favorite artist. Try it for 30 days. If you decide to keep it send your money to..., otherwise destroy the CD."

Think about how many people would make themselves a free copy then return or destroy the CD. It's time to abandon this scheme. The solution:

I proclaim, "Down with shareware! Bring on the Demoware or Crippleware."

Demoware would take after the coin-op video games attract mode. Once the user starts the demo program, no user input would be allowed or accepted by the program.

Crippleware would allow the user to do everything the program can do except let the user be productive. I know PageStream is not shareware, but its demo is an excellent example of crippleware.

With the PageStream demo a user can try almost every feature, but because files can't be saved and the printouts have the phrase "PageStream Demo" in large letters running diagonally across them, the demo can't be used to produce a newsletter, magazine or whatever.

Crippleware and Demoware completely eliminate the three problems I outlined. The false concept of "sharing" is eliminated. The author is motivated by monetary profit. An incentive to register for the fully functioning version now exists. The erroneous marketing technique has been replaced with the Demo/Cripple-ware Declaration:

"This software is a demo/crippled version of a commercial copyrighted fully functional piece of software. It is written as a profit-seeking venture by the author, just like software found in a store. This author has chosen to direct market his creation to potential users instead of selling it through a mass-market high volume distributor. Third party mass-marketing could double or triple the selling price. This demo/crippled version is free so you can test drive the program. The fully funtioning version is available directly from the author."

Since I spent time spotlighting Craig, I want to let everyone know I wrote this mess...uh, article using Craig Harvey's Diary—version 2.0d—which I purchased directly from Craig.

An Atari Tale (or maybe Tail?)

Brent Fisher (CACE)

In place of my normal column for this month I have decided to tell a little story. It all began about a month ago (and here you all thought I was going to say a long time ago) on the CACE BBS.

The Setting

It seems that one of the Atari users became a bit perturbed with the other Atari users on the board. It seems the other users just were not posting messages in the Atari section. Personally, the SysOp didn't really have too many options.

One really can't force one's users to post if they deem it something that they would rather not do. So our stallwart SysOp simply did as best he could. He would post meeting times and other Atari related information as best he could, and hope that sooner or later the other users would join in and add their own two cents worth.

Well, low and behold, one fine day a user did (you knew I would cut to the chase sooner or later) respond with a scathing message. Something about the users being only game players and that sort of roughish crowd. More than likely there were a few other choice phrases but that one should do for now.

The Villain of the Piece

The SysOp was not terribly sure what to think of this development. He simply sat back and waited to see if the users would deem that a response was necessary. To the SysOp's mild shock and pleasant surprise, the users did respond, and with quite some fervor too. They gave the user with the biting message quite a run for his money (OK, OK modem! Some of you are so picky, sheesh! <GRIN>).

The Cavalry

One user took a vastly angry and offended tone and really took the blasphemous user to task. I believe there were phrases like "How dare you call my computer a silly game machine" and something like "If you hate your machine so much why do you keep it?"

One of the users though did seem to take it rather well and responded with a rather humorous bit on being lucky that the user didn't have to put up with a Timex/Sinclair. Also I believe he mentioned something about a hospital mental ward (sometimes we really wonder about our users).

Placating Users

Anyway before everything escalated into explosive violence (wouldn't want another Middle East thing, I already know too many friends over there), the kind SysOp intervened and thanked the users for renewing his faith in them and the response that they had given after being poked with a stick (I guess sometimes you need a little turbulence) so to speak.

He thanked one and all and wished them all good health and told them all to go play a @ircular Logic game (How do you like that Tom? I even included the @ symbol!).

Of course, as with all confrontations, the ending wasn't totaly peachy keen.

Tempers, Tempers!

A couple of users didn't quite get the SysOp's message before reading a couple of responses to their responses, but hey at least nothing like the War of 1812 happened (just for you history buffs). Anyway, everyone is back on a normal standing once again.

The Moral of the Story

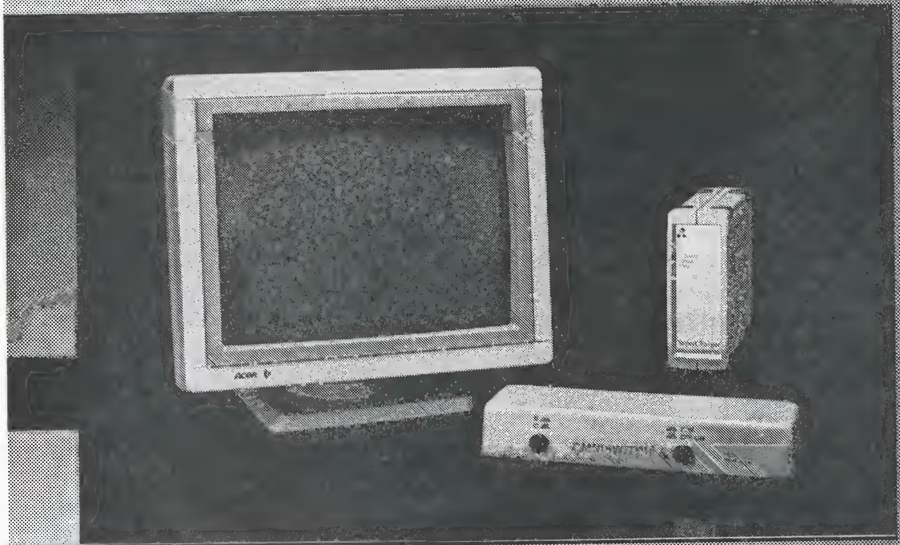
I suppose that I should go ahead and wrap this up. So here goes. The moral of this story is that no matter what, 8-bit people are still alive and kicking out there, and they still love their machines. Atari take notice we are still here.

Anyway, just one friendly plug. You can reach the CACE BBS by dialing 1-517-764-4047, 24 hours, 300 to 1200 baud (what can I say, too broke to afford 2400 right now, but we do take donations).

I bet you all are wondering just what did happen to the trouble maker. Well, let us say he has his just desserts. The SysOp made him the Atari board SigOp. I hope you all enjoyed my little story and come by and see us at the CACE BBS.

“Super-Charger is the MS-DOS Emulator of Choice” —Milt Creighton

Current Notes Magazine



Plus Other Outstanding Products for the Atari

Super Charger

- The Only external IBM emulator.
- Norton factor of 4.4.
- Atari's memory can be used as a Ram Disk or Expanded Memory.*
- Runs Windows 3.0.
- Free 1Meg of memory included.
- 1Meg of memory can be used by your Atari as a Ram Disk.
- Free MS-DOS 4.01 included.

$450.00

Omniswitch

- Two monitor ports (DB9 & DB15) allow you to use Multisync Monitors right out of the box.
- Omniswitch functions as a monitor switcher for standard Atari monochrome and color monitors.
- Enables you to use two external floppy drives (2-3.5", 2-5¼" or 1-3.5" & 1-5¼").
- Custom designed software allows you to change resolution without re-booting.

$89.95

Acer Monitor

The Acer multisync monitor model 7015 supports an 800x600 resolution and accepts both "TTL" and "Analog" signals. It has a 14" diagonal display with a .31mm dot pitch. The Acer comes with a tilt swivel base and a non-glare etched screen. The Acer monitor works on all Atari ST** and TT line of computers.

$449.00

*Call for details.

**Requires a monitor interface like the Omniswitch.

Data Loss on the Atari

Robert C. Arp

During my early computer training, I logged in many hours in discovering new ways to lose and corrupt data files. One of my most skillful methods involved typing for hours, so engrossed in program design that I'd forget the most important aspect of the creative cycle—saving the most recently generated ideas to disk. Eventually, I became paranoid about data loss.

Because I was using a terminal connected to a mainframe, there were no floppy disks on which to store data. But I became adroit at backing up everything to cards and paper. I even traded my video terminal for a Texas Instrument printing terminal.

When I started using my personal computer, I decided to abandon data loss as a field of expertise. I formulated the following fundamentals to govern my computing behavior:

1. All data worthy of preservation should be saved in at least two primary storage media.
2. "Primary" storage media are those which are least likely to be destroyed by forces other than the normal deterioration of the media.
3. The best candidates for primary storage media at my disposal are paper and floppy disks.

In my computing environment, the hard disk drive is used for temporary storage—somewhat more permanent than RAM—but temporary nevertheless. I rarely use a hard disk backup program because I immediately back up hard disk bound data to one or more floppies; then, at significant intervals, I print to paper. I do back up an entire hard disk partition to floppies whenever I drastically alter the major files in that partition. That has occurred only three times in four years.

Some might say, "But hard disk drives are so much faster than floppy disks." So what? RAM is much faster than hard disks, but who would suggest that we trust RAM to preserve data? No matter how much time is required to store on floppies, that time is never as great as that required to regenerate ideas once they have been lost.

I think of a hard disk partition as disk technology's equivalent of a battery backed RAM disk. A hard drive is an excellent production accelerator, but my data is too valuable to be entrusted to such a fickle storage medium.

It's not that a hard drive is intrinsically volatile; it's the manner in which they are used that subjects the medium to data destructive forces. Precisely because hard drives are inherently the most reliable, fastest and cost effective medium available, they are used in the most precarious computing environments.

A malfunction during backup, optimization or restoration could wipe out all or a major portion of a hard disk's files. Of course, if you can afford to lose all of the data stored on your hard drive, you've nothing to fear.

Me, I can't afford such a loss, so I put my trust in floppies; and I save my data to them often during each productive session. I haven't lost so much as a single line of data in four years, so I guess I'm doing something right. I have misplaced a file or two during that time, but, fortunately, copies of those files were in the GEnie library; therefore, I simply downloaded them.

Now, as much as I respect floppy disks as a storage medium, there is no substitute for the comforting feel of hardcopy. In spite of that, I rarely print certain types of files; images for example.

I'll now tell you what prompted this article. I've just finished reading "The Hard Disk Companion" by Peter Norton and Robert Jourdain, copyright 1988 by Brady Books. This book has been written specifically for an IBM PC audience; however, its contents are relevant to ST users—both professional and casual. The language used by the writers is not technical, and the price of the book is a comfortable $21.95.

"The Hard Disk Companion" explains every hazard associated with hard disk drives, and it compares those with some of the hazards of floppy and tape units used for backup storage. In addition, there are discussions about every type of hard disk related software, with particular attention focused on malfunctions that can occur during the use of that software.

Some of the topics I found especially interesting were related to file fragmentation, removable drives and image versus file-by-file backups. The book contains an index and an excellent glossary. I'm sure that once you've looked it over, you'll not be able to resist the purchase.

dBMAN TipSTer:

PART TWO on dBMAN/dBASE III+ Compatibility

Peter Killian (O-ACES)

As many of you know, especially if you read my last article on dBASE compatibility, you can use many dBASE II or III or III+ routines with dBMAN on your Atari ST.

If you are interested in writing programs for other machines, many of those you might write for dBMAN on the ST can be used with dBASE on those other machines. If you are lucky to have dBMAN on that/those other machine(s), you ought to be able to use even more of them (dBMAN versions are available for PC-DOS compatibles, LANs, Amigas, UNIX/XENIX, and even some mainframes). But enough of rehashing old info, let's look at some routines and ideas!

Many of the ideas I am sharing with you here came from repeated trial and error (experimentation for those who like longer words) after running into errors or unexpected situations. This month is no exception, since the first situation only occurred after using a program for a while, when I started running out of space on the disk.

Now, this may not be a problem for some of you who have huge hard drives, but I did not always have one at work and I still haven't been able to afford one at home. Even if you do have a large hard drive, it is a good idea when programming your own application to have the program help you back it up to floppy.

Unfortunately, this is another case where you have to use a different set of commands with dBASE III+ than with dBMAN, though the command at first looks the same on both.

Both dBMAN and dBASE III/III+ (I don't think this function is available with dBASE II) have a function to see how much room is left on the disk—DISKSPACE().

Unfortunately for dBASE users to use the command, you must first change the default disk drive. It is much simpler for dBMAN users, though, since they can specify which drive to check in the parentheses which follow this function.

This is further complicated under dBASE since there is no command to remember what the default drive was before you change it and many programmers (me, too!) prefer to write their programs to work on any drive, including hard drives and RAM-disks. Of course, dBMAN has such a command and even allows you to specify different default drives for different files (data, indexes, programs, etc.). Here is how you do it in both systems (look also to the disk of the month for a file called CHK_BSZ.CMD to see how these can fit into a larger routine from a program I wrote):

1. dBMAN

```
* Find out remaining space on
drive B: (second drive)
cur_size = DISKSPACE(2)
```

2. dBASE III/III+

```
* Find out what the current de-
fault drive is (to set it back
later)
cur_drive = SUBSTR(DBF(),1,1)
SET DEFAULT TO B
cur_size = DISKSPACE()
* then set the default back to
what it was
SET DEFAULT TO &cur_drive
```

I don't know about you, but I find the dBMAN way much more elegant. Now, you might think the longer method used with dBASE would also work with dBMAN, but it turns out it will *not*, because of what dBMAN assumes if you do not specify a drive with the DISKSPACE() function. You would expect it to be the default drive, but unfortunately (at least every time I have tried it) it always returns the drive I ran dBMAN from—even if I change all of the defaults!

The second subject I want to talk about covers some routines I now use in almost all of my dBASE and dBMAN programs. I have a couple routines that work almost identically in both dBASE and dBMAN, although there are some subtle differences and I greatly prefer the "feel" in dBMAN when they are compiled.

Compiling, of course, is not a problem for most dBMAN programmers anymore since the compiler now comes with the program and I highly recommend you compile your programs most of the time. Not only does it speed things up a lot, but the process of compiling will help you catch some errors you might miss otherwise.

There are a couple ways to read the keyboard with dBASE or dBMAN, including a function that might be familiar to some BASIC language programmers—INKEY(). Here is a sample (the disk of the month should include a larger example as I have actually used it and you can include in your programs) of how to read a single key with INKEY():

```
ikey = 0
DO WHILE ikey = 0
```

```
ikey = INKEY()
ENDDO
 keypressed = UPPER(CHR(ikey))
```

The INKEY() function checks to see if the person at the keyboard is pressing a key at the instant the function is executed. It seems dBASE does it better even though dBMAN is nominally faster, because dBASE normally remembers keys already pressed even though the command has not yet executed (i.e., type-ahead works better). This is actually sort of "cheating" (although I have gotten quite used to and tend to prefer this "cheat")—the INKEY() function as defined in most other languages does not read "saved" keys.

The reason it is a problem with dBMAN has to do with the fact that the dBMAN interpreter normally checks after each command to see if you have pressed one of several special debugging keys. These keys allow you to single step through a program, change or insert lines to see the effect, and even resume execution at full speed. Unfortunately, when dBMAN checks for these keys, it discards any other (non-debugging) keys that may have been pressed in the meantime. Since dBMAN is executing the commands so quickly, it often has already discarded the key before you have a chance to read it. The end result is a choppy, hard-to-predict response where you would often have to press the key several times to get it to register.

There are ways around this, but I don't like the main method because it disables those debugging keys which I often like to use while I am testing out a program, and by compiling, I get enough extra speed to make this loss of keys less objectionable. It also disables the ability to STOP a program with either dBASE and dBMAN if you made a mistake in your programming. You can turn off the debugging and program-stopping capability by using the command: SET ESCAPE OFF.

Besides disabling the debugging keys, there is another way that works if all you need is a single keypress, as when you want to choose a single option from a menu. This method uses the GET command after a SET CONFIRM OFF. It does *not* return the ability to read "saved" keys, but does remove the choppy response. The choppy response is removed because the interpreter stays on the same line, thereby avoiding the debug key check which occurs *between* lines. Here is a short routine to put a prompting message at the bottom of the screen, wait for the user to press a key, check if the key is allowed or not, and then pass it back to the program that called it:

```
****************
* get_bkey.cmd *
****************
PARAMETER key_prompt,valid_keys,key
STORE .F. TO got_valid
STORE "?" TO key
DO WHILE .NOT. got_valid
   STORE "?" TO key
   CLEAR GETS
   @ 23, 0 CLEAR
   @ 23, 0 SAY key_prompt;
     GET key
   READ
   STORE UPPER(key) TO key
   IF AT(key,valid_keys) > 0
     STORE .T. TO got_valid
   ELSE
      * BEEP
      mkey = key
      IF mkey = " "
         mkey = "[space bar]"
         STORE "?" TO key
      ENDIF
        msg = mkey + " is NOT allowed!  Press
[space]"
      @ 23, 0 CLEAR
      @ 23, 0 SAY msg;
      GET key
      READ
   ENDIF
ENDDO
@ 23, 0 CLEAR
RETURN
```

Until next time, happy computing!

P.S. If you have any comments, questions, or dBMAN topics you would like to see in future columns, drop me a line on GEnie (PKILLIAN) or via the US "Snail" at this address: 8629 S. Glenview Dr., La Vista, NE 68128.

$19.95

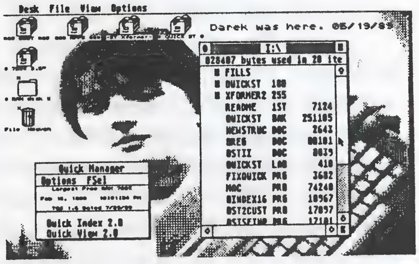
FEEL THE SPEED!!

Quick ST II

- speeds up screen graphics faster than hardware accelerators
- speeds up all fonts, including GDOS fonts
- requires less than 25K of memory and runs on any ST or STE
- supports all screen resolutions, including Moniterm
- supports custom desktop backgrounds and fonts

The screen shot on the right shows a typical ST desktop with Quick ST's desktop background feature installed. Supports .PI2 and .PI3 DEGAS pictures.

Also shown is the Quick Manager tool manager, free with Quick Tools.



$29.95

10 UTILITIES + QUICK MANAGER

Quick Tools

- includes 10 useful Tools, including a command line interpreter, fast file viewer, speed benchmarker, label maker, file finder, environment editor, and more. Each Tool can run as .PRG or .ACC.
- includes Quick Manager, which supports 10 desk accessories, displays the time and date, free RAM, and TOS version.
- requires less than 70K of memory and runs on any ST or STE

Instant Graphics and Sound: An OnLine Odyssey

Jon Bailey (MACE)

I have seen the future of ST telecommunications and this is it. The new Instant Graphics and Sound (IGS) program, from shareware author Larry Mears, not only provides dazzling visual effects, but also beeps, bells, hoots, whistles and a varied assortment of other goodies! Let me begin by telling you my first experience with IGS.

When you first undo the IGS ARC (or LZH), you get a desk accessory, two text files and an .EMU file. (The .EMU file is for users of the InterLink terminal program.) After a quick glance through the docs, I popped it into my root directory, rebooted, ran Flash and began my journey into the new age of online modeming.

Using IGS

Using IGS was simple enough. I dialed the BBS where I had downloaded it from (which boasted IGS demos in the library section), right-clicked the mouse, activated the desk accessory, set the baud rate and watched.

At first, everything seemed normal. VT-52 worked fine, and everything seemed to be progressing as always. I selected "IGS Demos" from the menu, crossed my fingers and picked the "Blitz" demo. *Wow!*

The graphics and sound capabilities of IGS must truly be seen to be believed. I expected online graphics to be slow, black and white line drawings, or something like an .RLE picture from CompuServe.

Boy, was I ever wrong!

Fantastic graphic special effects came on the screen quickly and smoothly, ranging from pictures, to special text you are only used to seeing while using Degas or NeoChrome! I was hooked.

How IGS Works

Reading through the doc file gave way to further amazement. *all* IGS special effects are generated *without* any control codes or Escape codes! IGS simply looks for a command sequence "G#" and begins interpreting the text as IGS commands from there on.

This means that IGS can be implemented on BBSes that do not allow special control codes or even typed directly into messages(!). The format was amazingly easy to learn, and a few minutes reading of the included doc file had me on my way to typing up short little graphics of my own in no time!

Disadvantages

Well, nothing can be *perfect*, not even IGS. I've encountered only two bugs; it will not run properly with QuickST (Darek Mihocka has been notified of the problem and last I knew he's working on it), and also the accessory has locked up for no reason on occasion, though this is extremely rare.

In Conclusion...

Well, all in all, if you own a modem, IGS is *worth the download.* It has features for everything from online cartoons, MIDI, to mouse commands, with which it is possible to create an *entirely mouse-driven* BBS with *no modifications whatsoever*, if the text files are done right(!).

Everyone who gets this program, I ask you to *please* mail in your Shareware donation to Larry Mears, so we can see further revisions with even more features.

Systems Featuring IGS

In my local area, the Power Tek BBS (313)422-3317 has recently installed IGS menus and demos. However, the true treasure trove of IGS is the London Smog BBS at (714) 546-2152.

What's the Good Word?

(For the ST)

Gordon Totty (MACE)

Much Ado about Words

I like words. Sometimes, I think about their power. For example, think about what they mean to humanity. Where would we be without them?

Grunts and gestures are only enough to keep us at the level of our cave-dwelling grandparents. At that level, what would us poor writers do? You can't write down a grunt. You can describe a gesture, but only with words.

No words. No Atari Interface Magazine. Nothing to read. No angry letters to Mr. Tramiel, and wouldn't it be a hardship for some of us to give up that hobby? A small advantage: no junk mail!

No words. No way to communicate, accurately, that you want your eggs scrambled but not mushy, your toast brown but still soft inside, your coffee black but sweetened and not too hot, and your orange juice strained to get out all the pulp, like mommie used to make it for you. (Can you tell I am writing this before breakfast? Can you tell mommie spoiled me? If so, we have achieved non-verbal communication, but words were used to set it up.)

Too Many Words

Well, worry no more. Bless us, we got words. Lots and lots of them, so many that we even can afford to play with them. One way to play with words is word search puzzles. Another is crossword puzzles, which sometimes involve a play on words.

If, like me, you enjoy either of these, read on. I'm about to point out the point.

Word Quest is a program to generate word search puzzles, and Word Quest 2 is a program that builds crossword puzzles. Each one costs $29.95; I think you can buy both as a package for $49.95. They are available from Artisan Software and are usually advertised in this magazine. Both were written and compiled in GFA Basic by Donald A. Thomas, Jr.

Word Quest

With Word Quest (let's call it WQ from now on), you can build your own word search puzzles in character grids from 5x5 up to 20x 20. For the benefit of the uninitiated, a word search puzzle is a grid of letters with a list of words beneath it. You must find the words in the grid, and they may be printed up, down, diagonally or backwards. Their locations are obscured by a lot of superfluous letters that fill in the spaces between the words.

When is the last time you enjoyed doing a word search? For most of us (since most of us are younger than me), that would have been in school. (Word searches weren't yet invented when I was in school with Herr Gutenberg. If only he had gone out for basketball, like I tried to convince him to, instead of tinkering with some kind of stupid contraption. He could have made the NBA, moved to Detroit and been a bad boy.)

WQ does its job very well, efficiently, effectively and with helpful options. It is loaded with commands, including:

Cite Documentation (from within program)
Delete Word, Enter Word, Load, Save
Fill Puzzle (with superfluous letters)
Open (opposite of fill)
Key (locator, or answer sheet)
Print (to screen, printer, or disk)

In all, there are about 19 identified commands, nearly one for every letter of the alphabet. They are accessed by mouse or by control-key combinations.

Best in Class

I'll bet WQ is the best program on the market for making word search puzzles. In fact, it may be the only program on the market for this application.

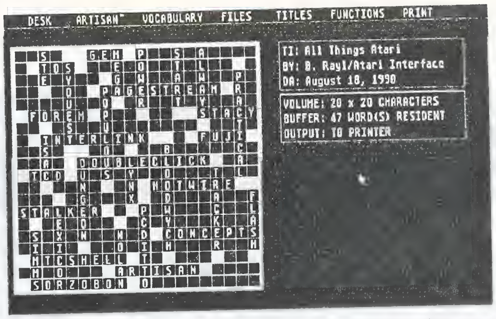
If you are a teacher (K-4, particularly), you might find this program very useful. For one example, during the first week of the new school year you could make a word search out of the student's names to help them begin to know one another. Or, make a puzzle with the week's spelling words or key words from the various lessons.

Other than a special need like that, however, the usefulness of WQ would appear to be limited. If you are not a teacher, you should be sure you love word searches, and have somebody to share them with, before you buy WQ. (You need somebody to share them with because, obviously, you know the solution to any puzzle you create.)

WQ comes with 50 puzzles and, for $9.95 plus $1.50 P&H you can send for 50 more.

Another Quest

Word Quest 2 (WQ2) is amaz-



TI: All Things Atari
BY: B. Rayl/Atari Interface
DA: August 18, 1990

VOLUME: 20 x 20 CHARACTERS
BUFFER: 47 WORD(S) RESIDENT
OUTPUT: TO PRINTER

ingly similar. You can generate crossword puzzles from 5x5 up to 20x20 in size. That upper limit seemed small to me until I checked the Sunday puzzle in the paper, which I think is very large. It was 21x21. So, don't be fooled by the number like I was; WQ2 can be used to build "professional" size puzzles.

WQ2 looks very much like WQ. The screens are similar, and so are the commands. WQ2 includes over 20 commands, so it has one or two more than WQ, but the commonality of commands is extensive.

Having programmed WQ, it was not too difficult, I imagine, for Donald Thomas to build WQ2. A crossword is like a word search, with small differences. "Fill" is with blackened boxes, not superfluous letters. Diagonal or backwards words are outlawed. Instead of being given the word, you are provided a definition of sorts. The solution must be filled in, not circled.

Who Needs It?

As above, this is likely to be the best, if not the only, program in the Atari market for making crossword puzzles. As above, do you need this application? I don't, which has made doing this review a bit difficult for me. I want to be fair, so let me quote the documentation on usefulness:

"Word Quest 2 is a powerful GEM-based program designed to construct crossword puzzles fast and efficiently. Virtually everyone can build a custom puzzle from a list of their own words in a matter of just minutes. Teachers can implement puzzles to augment their education of subjects and vocabulary. Publishers may integrate completed puzzles in their publications."

If I were a teacher, I'd use WQ2. It works as advertised, except that you have to get past the learning stage in order to make a puzzle as quickly as advertised. I am sure, however, that it is possible. The last statement comes from one who is certain that he owns programs that might not ever be possible to master! WQ2 is not one of them.

As a lover of words, I am also a lover of crosswords. No, not words spoken in anger—I can do without those—but puzzles. I thought that if I had a friend with an Atari who also loved crossword puzzles and who also owned WQ2, then we could amuse each other with our creations. Living with a kindred puzzle fanatic would simplify the problem by eliminating the need for dual equipment and software. But, my wife doesn't like crossword puzzles, and I haven't found that special friend. Oh, well.

WQ2 comes with five puzzles. My needs are better met by the Detroit News/Free Press, which comes with six small and two big crossword puzzles per week.

Printer Problem

One last comment on WQ2. I couldn't print my puzzles, even after using the "install printer" option. The printer would respond, with all text acceptable, but the puzzle grid, from top to bottom, was "overstruck" on the first line, OK for five lines, overstruck for three or four lines, OK for three, etc. Eventually, with experimentation, I got an acceptable print out of the puzzle grid and clues, but the title of the puzzle wouldn't fit on the page (truncated on the right).

Random line feeds? Highly unlikely. Problem with WQ2? Probably not. I have had more than my fair share of getting programs to drive my printers. Usually, it is my fault. TOS 1.4 demon? Couldn't ever happen. Brain dead Panasonic KX-P1092i? No way!

Help Yourself

I mention this only in the unlikely event that you experience the same problem. If you do, don't contact me. I usually can't even help myself. (Except at dinner.)

DC DESKTOP

"The GEM Desktop just got better"

Enhance, don't replace!

- Place icons directly onto the desktop
- Display unique icons for all files and drives
- Store frequently used files and programs in our exclusive CABINET virtual disk drive
- Display NEOchrome, Degas, Spectrum and other pictures with no Install Application
- View files at the desktop with an enhanced SHOW routine (with mouse control!)
- Replace the desktop with a pattern or picture
- Recover files from the trash
- Printer spooler and icon (to drag files to)
- Works in all resolutions
- Drop down menu commands via keystrokes
- Load different desktops with a keystroke
- Comes with Quick ST 2.0 demo, a command line interface, bootup selector, icon editor
- Special hooks let RAM resident programs be called with one key from DC Desktop
- Completely modular and memory resident – only use what you want!
- Much more

DC Desktop—The Desktop Enhancement

Bill Rayl (WAUG)

If you're one of those unlucky souls still using the plain, old ST desktop, you should take a look at Double Click's second commercial software release—DC Desktop.

Billed as "a unique extension/enhancement to the GEM desktop," DC Desktop is the equivalent of a $1,200 tailor-made suit for your ST. Actually, it's more like a whole new wardrobe! And, with a retail price of only $39.95, it's like buying that expensive wardrobe at wholesale.

Dressed for Success

The DC Desktop package consists of the DC Desktop "master" program and a handful of useful modular desktop enhancements. The modular design gives you great flexibility in "designing" your very own ST desktop. The modules add such features as viewing pictures and viewing/extracting ARChive contents, replacing the desktop background with a picture or fill pattern, installing a handy print buffer, adding keyboard equivalents to the GEM desktop's menu commands (such as FORMAT) and lots more.

The "master" program itself gives you a recoverable trashcan, unique customizable program and drive icons, the ability to place program icons on the desktop and execute them from the desktop or via a "hotkey" and an excellent "Cabinet" feature. DC Desktop works in all resolutions and all the "normal" GEM desktop functions work as usual (including Show as Text).

Closer Inspection

Since DC Desktop has far more to offer than I have space to write about, I'll try to cover a few of the things I feel really make this product shine.

First, let's look at those nifty Cabinets. This is one of those "what a great idea, why hasn't this ever been done before" kind of features. Here's how it works: DC Desktop supports a "virtual disk drive" called a Cabinet. You can copy program icons from various drives/folders into a Cabinet and run these programs from the Cabinet rather than hunting all over for them.

This is a very handy feature for hard drive owners, especially users who frequently use a number of programs for specific somewhat related tasks. For instance, desktop publishers can set up a DTP Cabinet containing icons for their DTP package, word processor, graphics converter/paint programs and other tools of the trade.

The Cabinets are treated just like any other disk drive—you can create folders in a Cabinet, delete file icons from a Cabinet, etc. Since the actual program files do not get moved to the Cabinet, blowing away a Cabinet's contents will not affect the actual files themselves. Up to 11 different Cabinets can be set up, and DC Desktop allows you to load/save Cabinets with a single keystroke combination.

Showing Off

Three of the DC Desktop modules—DC Show, DC Show Pics and DC Show ARC— give added flexibility to the desktop SHOW routine. DC Show works on text files, allowing you to scroll/page up and down through text, search for character strings and even print files while viewing them.

DC Show Pics is a versatile picture viewer that can show Neochrome, Degas, Tiny, Art Director, Spectrum (SPC, SPU and SPS format!) and even IMG pictures. Other than Spectrum, all formats can be viewed in any resolution. Monochrome high res pictures are displayed with a "psuedo-gray- scale" on color monitors, while color pictures on a mono monitor are shown using true gray scaling. All that and big screen monitor support, too!

DC Show ARC allows you to get a verbose listing of an ARC file's contents or to extract those contents. When extracting, DC Show ARC can automatically create a folder with the same name as the ARC and place the ARC contents into this folder.

As memory resident programs (i.e., run from the AUTO folder), these modules automatically take over when you double-click a given file type and select SHOW from GEM's SHOW/PRINT/CANCEL dialog box. If you don't want to constantly use your system memory for any or all of these features, these programs can also be used directly from the desktop. That's a very nice feature of DC Desktop—you can still use the modules not permanently installed.

Icons Galore

Probably the most visual feature of DC Desktop is the display of unique file and drive icons. These icons are contained in the DCDSKTOP.ICE file and are fully editable using the provided DC ICE Icon Editor.

Individual floppy disks can contain their own different icon files that will automatically load when you insert the disk in a drive. This feature allows companies and PD/Shareware authors to create "official" DC Desktop icons for their products.

Literally thousands of icons are already available for DC Desktop. Many of these have been ported from the Macintosh world thanks to Wizworks' Multi-Viewer Graphica. These icons are available on the online services or from Double Click's very own BBS.

With the DC Icon Installer, you can place from one to 25 of these program icons directly onto the desktop and assign a hotkey to the program. Once installed, you can run the program by either double-clicking the icon or by pressing the hotkey combination.

Adding to the Ensemble DC Desktop offers all these features and more. The 40+ page manual is, at times, a bit confusing because it jumps back and forth between topics. Nonetheless, the manual is well-written, easy to read and very thoroughly describes all that DC Desktop currently has to offer. The manual also gives a good deal of technical info programmers can use to create their own modules for DC Desktop. The good folks at Double Click have created an open-ended package and provided programmers/users a means to make their own additions to the software.

Overall, I have experienced no problems using DC Desktop on both an ST with TOS 1.4 and Atari's new STe. The only "quirk" I found was an incompatibility with one of my many other AUTO folder programs that caused DC Desk Drop not to install a picture on the desktop the first time I tried it. After rearranging the boot sequence of the files, everything worked fine.

When first released, there was an incompatibility with SofTrek's Turbo ST 1.8 and DC Desktop. Basically, the custom icons would revert back to normal when selected. A patch to Turbo ST was promptly uploaded to the online services.

Enough, Already!

Flexibility is the buzzword here. No other product gives you so many options for tailoring your ST desktop to your own needs. If you're tired of the standard ST desktop, yearning to add a little spice or power to your system or looking for a customizable, flexible desktop enhancement, DC Desktop should suit you perfectly.

HIGH DENSITY DRIVES for the ATARI ST

A-T-A-R-I

Answers-Tips-And-Relevant-Information

Paul V. Alhart (AFED)

A few years back I bought a new toaster. It was a shiny chrome four slice Upandown model. Boy what a toaster. It wasn't too expensive, but it sure could make toast. And fast too.

It seemed everyday I would discover a new type of bread to try in my Upandown. There was white, rye, raisin, cinnamon and hundreds of others. I had a wonderful time toasting and tasting them all, although raisin has probably always been my personal favorite.

I told all my friends about the great little Upandown and recommended they get one too. It was a little hard to find one, though. There were not many Upandown dealers and I don't remember ever seeing an advertisement for their great toaster. But, when the discount chains stopped carrying the Upandown I was really upset.

Recently I wrote to Upandown and let them know my feelings and was surprised when they answered my letter right away. What they said was not what I wanted to hear, however. Upandown had decided to get out of the toaster business and convert all their assembly lines to manufacture the Upandown Yo Yo.

Now what do I do? I guess I'll have to go shopping tomorrow for a new brand of toaster. Sure my Upandown toaster still works fine, but with no factory support who will ever bake a *new* type of bread for me to try? I know, I know, I hardly ever toast anything besides raisin, but...?

Sounds silly doesn't it? But that is about the same kind of talk I hear in the Atari user community all the time. "If Atari doesn't do something soon, I'll have to buy another brand of computer." Now that Atari will no longer make or support the 8-bit computer line, it is even worse.

If your 8-bit Atari is still serving you well, as mine is, what do we care what Atari does? Atari built a good machine and we bought it. After the warranty ran out, Atari had no more responsibility to support you or me than Upandown did.

So there won't be much *new* software written for the 8-bit. There hasn't been much written for some time now. But there has already been so much software written for the 8-bit Atari that you and I together probably couldn't find the time to boot it all, let alone use it all. The real problem here, as it has always been, is not Atari's lack of support, but finding the already available software you need.

Here is where user groups come in.Virtually every user group has a disk library available to its members. My guess is that groups on the East Coast have a much different selection of programs than groups in the Mid-West or the West Coast. We are all Atari users nonetheless and we *do* have a common tie. AIM.

If AIM were to start an 8-bit DOM using software from all the member groups' libraries, we would all benefit. Just making your group's library listing available to the other groups through AIM would be a good start.

The bottom line is this. If your Atari is doing what you want it to do, keep it and keep using it. Don't worry about what Atari is doing (or not doing). Support your user group, Support AIM, and they both will Support you and your trusty old 8-bit Atari.

Do you still use a "TRANSLATOR" to run some of the older disk-based software on your XL/XE Atari? I really like my 1200XL, but at the same time I really hate having to use the Translator to boot up certain software. What to do? I Translated the offending software to run on my system and filed my Translator Disk away in the back of a drawer somewhere. You can do the same.

In the beginning, Atari said, "If programmers use the *published vectors* into the operating system (OS), their programs will run on *any* 8-bit Atari Computer." (*If* is such a big word.)

To make a long story short, some programmers did not follow this rule, but to save a few bytes, jumped right into the OS. This was fine before the XL/XE machines came along with a different OS. The published vectors are still the same as Atari promised, but they point to different locations in the new operating systems.

The following list gives the published vector location and name followed by the "illegal" OS entry points to which these vectors point. If you find a program Jumps to F3F6 to open the screen (20 F6 F3), and you have an 800XL, change the code to (20 8E EF). Remember: Low byte/High byte. I have found this to be the most common illegal jump.

The next most common are the "K: Get/Put" calls. I spent many hours Peeking into my operating system with a lot of help from Compute's Mapping The Atari to come up with this list. It now saves me lots of time and hopefully will help you also.

Note: Translated software will only run on the O/S that it has been translated for, so keep an original copy as back-up.

Me and My Eight Bit

Chuck Antonelli (ACORN)

I'm mad as ever about issues concerning the Atari 6502 based computers.

First off, when I bought my first Atari 800, back in 1979 for over $1000 (including 16K and an 410 program recorder), the only other choices were a TRS-80, Apple II and the PET (Commodore). I know there were others, but they aren't worth mentioning.

The Atari, although overpriced, was the best buy. Atari was owned by Warner Communications Inc. and even offered an 800 number to call if you needed technical support. Atari never marketed their machines correctly, and Apple got in the door by making deals with schools, leaving Atari in the dust.

Not much has really changed with the company. Support is as low as ever, good new products are just as far and few and Atari is still undercutting their own faithful dealers by selling to stores like Kiddie-City.

As some of you know, from 1982-1983 I supported Atari systems at a store named "It's A Micro World" and founded IMAUG. You don't really know how bad it is until you are in a situation where you are spending $70 to buy an Atari wholesale, selling it for $124.00, and finding out that they are available from a small mail-order house for $69.95! And Atari owners wonder why there is so little support.

The last software/hardware package I bought for my systems is the Black Box from Computer Software Services (and I love it!) and the SpartaDOS XCart (which, when used correctly, is *wonderful!*). I am very happy with my set-up.

I have come to face the fact that Atari Corp. is a mess, and they are losing more ground every day. Poor management from Day 1 is the reason.

Nonetheless, I stand by and support the computers every chance I get. The Atari 800 was ahead of its time and offered many unheard of features. The systems themselves are great. I use mine for literally everything. I run my business with one, the point of sale cash register is an Atari 130XE, 1050 Disk Drive and an 820 printer. I run a BBS, 24 hours on another 130XE. I use my word processor, budget program, terminal package, games and other programs on the 800XL. I eventually want to link them together with the multiplexer from CSS when I get the time and energy.

When I need a program for my Atari, I sit down and write one. I don't go whining that there's no support. It's always been that way, and we've just never noticed it. When Micro Age had their user group meetings, we had members like Clinton Parker (author of Action!) who, rather than sitting back and complain, would do something about it.

Writing your own software and putting it on the shareware exchange is not a crime! Let's stop passing the buck and make an effort to come up with some creative ideas and software for our eight bits!

The Good, The Bad and The Ugly

Tim Craft (CACE)

What is a Good BBS?

Well, a good BBS is a board that has active message bases, tons of files and is well kept. The SysOp of a good BBS takes time to check every file or apoint someone to do that for him (a CoSysop), is active in all message bases keeping things clean and removing message bases that lack interest.

The users are what make a good BBS by uploading files and being a giver not just a taker; they also feel free to comunicate with their fellow users.

In short, a good BBS is a pleasure to use and not a task.

What is a Bad BBS?

A bad BBS is boring. Nothing goes on there, opening messages go unchanged for months on end. The SysOp only drops in once every week or so just to make sure the system hasn't crashed.

Sometimes there is as a good bad BBS in which the SysOp and users indulge in such practices as pirating and phone phreaking. These systems are nothing but trouble! The users of a bad BBS don't care about messages, they only want files.

What is an Ugly BBS?

An ugly BBS is a disaster—the system is continually crashing, menus are hard to understand; the users belittle you or don't care about the board in general. The SysOp never plays an active part; it is only a passing fancy and soon the board is taken down because of a lack of interest or that is is simply a hassle to keep operating.

Remember, only you and the SysOp can make a board a winner. If everyone plays a part the system works, but if nobody cares is will always fail.

Fast Technology's Turbo16 Accelerator Board

Don Schmidt (SWAG)

You've had your ST for some time now and would like or need a boost in performance from your computer. Well, there are ways to add speed to your Atari ST. With two very fine software programs, QuickST and TurboST, you can add dramatic improvement to screen displays. Paging through word processor documents and drawing displays are speeded up with the help of these programs.

What Else is There?

But you say, "I need help in my spreadsheet number crunching." Well, it's Turbo16 to the rescue. With the addition of this high quality accelerator board, you can expect 40 percent speed increases in spreadsheet performance. Formulas are executed more quickly and graphs are displayed more rapidly. Windows pop out on the screen and scrolling improvement is dramatic.

The biggest time saver I've seen so far was with a shareware program, Credenza Astrocal [1450 West 116th #21 Westminster, CO 80234]. This is a program to calculate sun rises, sets, moon rises, sets and other interesting information as our world turns. Turbo16 cuts the calculating/printing time of a yearly calendar from five and a half hours to three and a half.

How much does it cost?

It is a bit costly with a suggested retail price of $299 and one can expect up to a $50 installation cost. But there are ads in magazines and papers with competitive prices.

It is recommended your Atari service center do the installation. It is necessary to desolder the existing 68000 CPU, solder in a new socket, solder in a new 74LS74 chip and place a few jumpers to various points in the computer. Also, there is an option to place a spst switch (not provided in the kit) to select either 8 Mhz or 16 Mhz operation. Because there a some programs that will run too fast with the Turbo16, I recommend installing the switch. Mostly games have a problem with the speed.

A fellow SWAG member did the installation for me. When he finished, the computer refused to boot. A call to Fast revealed there are two brands of MMU chips used in the ST. Brand VIP can't handle the increased speed that Turbo16 puts out. The other brand, the compatible chip, has a part number that ends with -38. This bit of information would be beneficial if included with the kit.

This is a quality product that you won't want to do without, once you've used it.

Eight Bit Q&A

Tim Craft (CACE)

Q.How many bytes to a sector?

A. There are 128 bytes to 1 sector. Now whenever you're on a BBS and you see a file size called out in bytes, just divide it by 128 to see how many sectors.

Q. What are Pokes and Peeks?

A. There are memory locations in your computer that control different things. For example, some control the colors on your screen, some control sound, some control text brightness and color. These memory locations contain a value that controls their functions. Peeking at a memory location like typing "PRINT PEEK(710)" will give you the value in location 710. Poking at a location will allow you to change the value in that memory location.

If you type "POKE 710,0" the screen will turn black. You have just told the computer to change the screen color to 0(black). In BASIC this can be very useful. Here are some other pokes that will give you some neat effects...

POKE 54018,52 This will turn on your tape drive if the play button is pushed (that's great for playing tunes while you're programing).

POKE 54018,60 This turns off the tapedrive.

POKE 755,6 This will turn your characters upside down.

POKE 755,0 This turns inverse text to normal and turns the cursor off.

POKE 755,1 Turns the cursor off and makes inverse text vanish.

POKE 755,2 This turns all text back to normal.

I hope I have been able to help at least one new user fix or just get more out of their 8-bit system.

** ** Introducing the GOOD Backup Utility ** **

GOOD Backup Utility

Specially designed for keeping complete backups of your hard disk partitions. Backup disks are TOS compatible.

Intelligent Updates!

Update your backup every day! Only new & modified files are copied, and the old files are deleted to make room. As good as an image - but done in less time.

Great for use with Cartridge Disk Drives

All this for only:
$29.95
Suggested Retail Price,
(in massachusetts add sales tax)

Tid bit

Tidbit Software Engineering Company
25 Wood Lane, Maynard MA 01754
Telephone (508) 897-7429

Features of the GOOD Backup Utility:

- Copies data from a selected active disk partition to a pile of ordinary TOS readable backup disks.
- A backup can be interrupted before it is done, to be completed later.
- You can keep your backup saveset on floppy disks, removable cartridge drives, or keep a shadow partition on another hard disk unit.
- No folder limit on backup or restore.
- Any file that cannot be fit on a single saveset disk will be split up across as many as needed.
- Updates to the backup will only copy the files that have actually changed. If you update your backup frequently, the update goes very quickly.
- The GOOD Backup Utility can format floppy disks for you as additional disks are needed.
- Lost or damaged disks in the backup saveset can be replaced without replacing the entire backup saveset.
- Checksums are used to verify that the files on the active disk drive and on the backup disks are all intact.
- Write back disk cache technology is used to make all the copying go fast.
- Backup can be by partition, or select specific files by including or excluding a set of wildcard file specifications.
- Files can be restored as an entire partition, or by wildcard selection. When restoring an entire partition, only files that are actually missing need to be restored.
- A reference list can be produced for locating individual files within the backup saveset.

Pressing the HELP key will provide additional information at every step.

If your dealer doesn't have the GOOD Backup Utility, you can order it from the Computer Bug, 113 Russel St., Hadley, MA, 01035 (413) 584-7722

Mega Click™

For the Atari Mega 2 and Mega 4* Computers

BEST ELECTRONICS

New Product Announcement

Have you ever felt that something is missing from your Mega* computer? Those who have used other brand computers for work or school agree something is missing! When asked, any touch typist who owns a Mega computer will tell you right away! It's the Click in the keyboard key they miss!

Best Electronics is happy to announce their new product for the Mega 2 and Mega 4 keyboards called "Mega Click." By the name you can tell what this product does. After searching the world for half a year, we've found a replacement keyboard switch that gives the Mega owner that positive tactile "click" response like most real-world keyboards!

Our test sampling of Mega owners, who have tried our test Mega keyboards with Mega Click installed, all say the same thing, "I want the product now!"

The installation of Mega Click keyboard switches requires the ability to unsolder and solder-in components in your Mega keyboard. We strongly recommend that installation be done by an Atari computer service center!

Mega Click keyboard switches are packaged in a **30 Switch Starter Kit** and a **10 Switch Add-on Kit**. Suggested retail for the 30 Kit is **$64.95**, and for the 10 Kit is **$21.95**.

Mega Click Products became available December 26th. Place your order now!

BEST ELECTRONICS (408) 243-6950
2021 The Alameda Suite 290, San Jose, CA 95126

*Atari, Atari Mega 2 + Mega 4 are registered Trademarks of Atari Corp.

Basically Speaking
Console Keys

Jeff Summers (ACORN)

This month let's look at the special keys located at the top of your XE computer or along the side of the keyboard in an old 800 or XL computer. I'm referring to the Start, Select, Option, reset, and help keys.

First off, the status of the Start, Select, and Option keys are all held in one memory location. By using the PEEK command, you can look at this location and then figure out which key or keys are pressed. The location you need to PEEK is location 53279. The meaning of the number returned is a bit cryptic, and best shown by a table:

Value	Keys Pressed
0	All
1	Option, Select
2	Option, Start
3	Option
4	Select, Start
5	Select
6	Start
7	None

Thus, you can see there is a different value for each key pressed, as well as a value for each possible combination.The help key is a different matter. This key is only present on XL and XE computers, and its state is reflected in a different location than the Start, Select, and Option keys (these latter keys are commonly called the Console keys).

When help is pressed, location 732 will contain a 17. If shift and help are pressed, the same location will contain 81. Control help puts a 145 in that location. So, you can monitor the status of location 732 using the PEEK statement to detect the state of the help key.

Just like the console keys, the help key does nothing by itself. Software must be especially programmed to make use of this key, and very little software has been so programmed, much to the chagrin of beginning users who expect something to happen when they are confused and press help.

The other key in this grouping is the reset key. Technically, this causes a "warmstart" of the computer. What in the world is a warm start? Well, when you turn the computer on, the first thing it does is check to see how much memory it has, what devices are hooked up, the status of the cartridge port, whether or not it should load DOS, and it sets up a lot of system locations in memory that it uses to remember where it is. This is called a cold start.

A warm start assumes the computer knows how much memory it has, has a DOS loaded or not appropriately, and that all the memory locations are properly set up but that the user wishes to stop the running program and get to the same state as when the computer was first turned on. This does not include wiping the memory clean.

So, a warmstart resets the computer, but less than a coldstart. This is what happens when reset is pressed. However, there is a way to get the computer to think that it is in a coldstart instead of a warmstart.

This will enable you to change DOSes, add device handlers, etc. without turning the machine off and back on again, which is a little damaging to the capacitors inside. POKE'ing location 580 with 1 and then pressing reset will force the computer to coldstart.

This will erase any program you have currently in memory, so be sure to save your work before whyou do this.

String Handling in GFA BASIC (or, It Slices, It Dices, It Chops...)

Micheal A. Calvin (SWAG)

One of the real strengths of any BASIC is its ability to manipulate strings of text. Those used to the 8-bit's way of cutting up strings will be confused by the new keywords used for the same purpose in GFA. Herewith are those keywords. *NOTE: variables included in braces [] are optional.*

RIGHT$(A$[,x])—take the rightmost x characters of A$. If x is not defined or included, take the last character of A$.

LEFT$(A$[,x])—take the left x characters of A$. If x is not defined or included, take the first character of A$.

MID$(A$,x[,y])—starting at x position in A$, take y characters. If y is not defined or included, take the rest of the string.

MID$(A$,x[,y])=B$—insert B$ into and over A$ starting at the x position in the string. If y is defined, insert only y characters.

TRIM$ (page 162) does NOT work, and is not recognized by the interpreter. Too bad, it'd have been useful in the example program.

UPPER$(A$)—Converts any lowercase characters in A$ to uppercase. (Very useful for disk file access.)

INSTR(A$,B$[,x])—Find the starting position of B$ (can also be text in quotes) within A$. If x is included, start at the x position in A$.

RINSTR(A$,B$[,x])—Same as INSTR, but the search starts with the rightmost (or xth) character and goes backwards.

LEN(A$)—returns the length of a string.

Combining (concatenating) strings uses the plus sign. e.g. BIG$=LITTLE$+ANOTHER_LITTLE$

The following simple-minded program uses most of these keywords, and the comments should help make the usage a little clearer.

Another hint, use mnemonic variable names, it makes debugging far easier. (But Uncle Mike, they *always* run the first time!)

```
'
' String Handler ....... It slices, it dices, it
chops....
'
CLS
PRINT
PRINT
'
' clear screen and bump down two lines
'
INPUT "Enter your full name please >",your_name$
'
' that's right, an input print statement!
'
b%=INSTR(your_name$," ")'
'
' returns the string position of the first  space
'
c%=INSTR(your_name$," ",b%+1) ! count from last
space found +1
'
' find second space, if not a second space, c%=0
'
first$=LEFT$(your_name$,b%-1) ! pick off first
name
'
IF c% ! if there are two spaces, get middle name
or initial.
  '
  middle$=MID$(your_name$,b%+1,c%-(b%+1))
  '
  ' starting at the first space (plus one!), get
the next c%-(b%+1)
  ' chars
  '
ENDIF
'
IF c%
  last$=RIGHT$(your_name$,(LEN(your_name$)-c%))
ELSE
  last$=RIGHT$(your_name$,(LEN(your_name$)-b%))
ENDIF
'
' get the last name by subtracting c% (if
non-zero) from the length
' of the total string, otherwise subtract b%
'
'****************************************************
*****************
'  By the way, the % sign declares these variables
to be 16 bit
'  integers, saving a lot of memory. You can save
even more if you
'  only need an 8-bit integer, use the & after the
variable
'
'         e.g. B& would be an 8-bit integer vari-
able.
'****************************************************
*****************
'
UPPER$(LEFT$(first$)) ! capitalize names if the
user forgot to.
'
IF c%
  UPPER$(LEFT$(middle$))
ENDIF
'
UPPER$(LEFT$(last$))
'
```

```
PRINT ! blank line below input
'
PRINT "First name is: ";first$
'
IF c% ! If there is a middle name or initial,
print it.
  PRINT "Middle ";
  IF LEN(middle$)<3 ! if less than three chars,
it's an initial
    PRINT "initial is: ";
  ELSE
    PRINT "name is: "; ! otherwise a full middle
name
  ENDIF
  PRINT middle$
ENDIF
'
PRINT "Last name is: ";last$
'
PRINT
'
PRINT "Short way - ";LEFT$(first$);". ";! with no
second parameter,
' one char.
'
IF c%
  PRINT LEFT$(middle$);". ";
ENDIF
'
PRINT last$
'
PRINT
PRINT "In a mirror: ";
'
FOR a%=LEN(your_name$) TO 1 STEP -1
  PRINT RIGHT$(your_name$); ! Print the last
character
  your_name$=LEFT$(your_name$,a%-1) ! shorten the
string by one
NEXT a%
'
PRINT ! to clear last semicolon tie
'
'this last simply reverses the name on the screen
'
END

The Basics of Basic

Rick Burton (RACE)

This month, I would like to continue with the concept of strings by examining a cousin of the string called the variable.

You will recognize the family resemblance when you consider that variables are sometimes called "string variables". Included in our exploration will be a small bit of algebra giving us a handy metric conversion. Let's type another demo program:

```
10 ? "}"
20 POSITION 10,10
30 ? "ENTER KILOMETERS";40
   INPUT K
50 M=K*0.621
60 POSITION 5,14
70 ? "THE EQUIVALENT OF ";M;
   " MILES
80 GOTO 80
90 END
```

Now (as in last month's BASICS) an explanation of each line...

Line 10: Clears the screen. The question mark is short hand for PRINT and the arrow in quotes (which appears in the printout here as a curly brace) is made by first pressing the ESC key then holding the CONTROL key down while pressing the CLEAR key.

Line 20: Locates the beginning of text to be printed to the screen. The first number found after the POSITION command is spaces over from the left and the second is spaces down from the top. These must be separated by a comma. The screen can be seen as a 40 x 24 grid.

Line 30: Prints instructions to the screen. The semicolon "connects" the next program line to this one so the inputted number is on the same line on the screen. Try deleting the semicolon when you RUN the program to see what happens.

Line 40: Allows a number to be entered. The K is a "numeric" variable which does not require DIMENSIONING as a string variable. A question mark magically appears on the screen when INPUT is used!

Line 50: Multiplies variable K by 0.621 to assign a value to variable M. This is really the heart of the program which converts kilometers to miles. All the other program lines are simply making it convenient for the user to converse with the chips! (User interface, that is).

Line 60: Another positioning command.

Line 70: Prints more text to the screen with variable M having semicolon "connecters" on both sides to make text and variable apear as a continuous line. Note carefully the spaces in the quotes. Again, experiment with deleting semicolons and/or spaces to see the problems that arise.

Line 80: Keeps the computer spinning in circles. The READY prompt doesn't appear & you must press BREAK or RESET then RUN the program again.

Line 90: The END of the program!

Now RUN this handy little demo and try a sample value of 90 kilometers. Don't forget to press RETURN and voila! If all is carefully typed in you will have a converted value of 55.89 miles.

Want to make the cursor vanish? Add another line:

```
5 POKE 755,0
```

No more little white square! Notice that if you BREAK the program, the cursor remains invisible to mortal eyes but...RESET the program and READY appears with the cursor visible again. Hmmm?!? Stay tuned to future BASICS for more info on these and other cosmic mysteries...

SURGERY
DUNCAN

"When I said I suspected a terminal malfunction, I was referring to the computer Mr Larkin, not you."

Get Blitzed!

Mike Czebiniak (UNYACE)

Are you tired of buying different versions of Procopy? Don't you hate when Procopy won't backup your protected software?

I had always hoped Proco Products would combine all the versions into one big one but they never did. I wanted a copier that would backup most anything without costing an arm and a leg.

Getting Started

At last a dream come true! I downloaded the Blitz Copier; it claimed to backup most anything at record speeds. This I had to see! The documentation claimed all I needed was some basic soldering skills, a second disk drive, a spare drive cable, an RS232 female connector and a case. I found I could also purchase a ready-made cable from a number of sources.

I decided to make a cable rather than purchase one. It took about an hour to make the cable. Don't worry if your cable doesn't work the first time, just check the pinouts to see if they are soldered in correctly. The cable will work!

After you install your Blitz Cable, you are ready to boot your machine. You can boot the software by placing it in the AUTO folder, using it as an accessory or running it from the desktop. The software runs in all resolutions.

Once the software is booted, you are ready to turn on the second drive. Get your best protected piece of software...I found it to be Populous, because none of many versions of Procopy could make a running backup.

This copier actually can backup your software at speeds never seen before on the ST. To copy a standard 9 sector/80 track single sided disk (as formatted from the desktop) takes only 20-23 seconds in Turbo mode. A standard doublesided disk takes only 40-43 seconds to backup in Turbo mode.

Does It Work?

The Blitz Copier will backup most protected games. The only game I found it could not copy was Predator.

The Blitz Copier backs up your protected software by reading electrical impulses off the disk—not data. So the computer does not need to understand the information to copy it.

This means you can use the Blitz Copier to backup your protected IBM and Macintosh software if you're into emulation on the ST. The program reads and writes at the same time, so both drives must be at the same speed or very close to it.

The copy program has its flaws, however. The program won't tell you when it is done copying. It would be nice to hear a beep or two. The program also doesn't tell you if your drives are out of alignment. If your drives aren't both aligned and running at very close to the same speed, your backup disks will not work.

Limitations

The Blitz copies are only good for three generations. So, if you were trading disks of public domain software by Blitzing them, you could give one to a friend, he could give a Blitzed copy to a friend (using his Blitz Copier) and his friend could do the same thing.

After the third generation, the copy will not function. [Ed. Note: Actually, there are many reports that Blitzed backups cannot be copied even after one generation. Personally, I see this not as a flaw, but as a benefit—this means Blitz is great for making legitimate backups but ineffective as a tool for piracy.]

If the destination disk is write-protected (meaning nothing can be written to the disk), the Blitz Copier will seem to write to the B drive, but in reality nothing is written. The copier doesn't bother to tell you that it can't write to it.

I also found some software hard to backup on the first try. But, when I copied it again, the backup protected program worked. If you have trouble with a Blitzed copy, try backing it up a second or third time from the original disk.

Even with these minor flaws, the Blitz Copier is the very best out in my opinion. The software is in the public domain and can be distributed freely, but you will a cable to backup software.

Finally

Either make a cable or buy one from your local software dealer or from companies like Innovative Concepts.

[Ed. Note: The Blitz and Turbo Blitz software, as well as directions on how to make the Blitz cable, appeared on the January 1990 AIM Disk of the Month.]

My Experiences with APAC (Any Point Any Color) Mode

J.D. Potter

I first came across APAC mode while reading (alas, now defunct) Analog Magazine's May 1988 issue. "The APAC System" article by Thomas Tanida described an 80 by 96 pixel resolution mode that allows display of any of the Atari 8-bit's 256 colors at any point on the screen. This intrigued me, and I typed the BASIC listings in right away. Sure enough, the demos showed 256 colors, and the program gave ways to PLOT and DRAWTO in BASIC programs in this new graphics mode.

APAC mode works by displaying a line of graphics 11 information (that is, 16 different colors, all at the same intensity), followed directly by a line of graphics 9 information (sixteen different shades of gray).

The subtle shadings and realistic colors possible with APAC mode are nothing short of remarkable. I soon realized APAC should be good for doing much more than "drawing neat pictures" with BASIC.

I began to think of different applications. I had read a CompuServe article about their GIF(tm), or Graphics Interchange Format(tm). GIF allows users of different computers to exchange color pictures. These pictures had resolutions of 320 x 200 (and higher) at 16 colors per pixel (and up to 256). I also discovered Don Davis was developing his Atari 8-bit version of a GIF viewer. So I decided to head off in another direction with APAC.

One of my first programs was called COLRCODE, started in May '88. This was designed for owners of ComputerEyes digitizers.

I had seen dozens of impressive pictures created on an Amiga(tm) computer. I asked a friend about how these were stored on disk. He gave me a short description of the Interchange File Format (IFF) for Interleaved Bitmaps (ILBM). I studied the description and started developing ILBMREAD for the Atari 8-bit in August of 1988.

After a month or two, I had a program that would load and display ILBM pictures in APAC mode and save them to disk. I started downloading picture files from local BBSes and GEnie's Amiga Roundtable. With each new display mode I discovered, I would modify the program to decipher it.

I refined ILBMREAD and uploaded the first version to GEnie in February '89 (#4141). The user interface was a little clunky, and it only supported a few ILBM modes.

In the meantime, I became an active reader of the comp.graphics newsgroup available on Internet. A couple interesting articles on GIF and Lempel-Ziv Welch (LZW, the compression algorithm used by GIF, ARC, and AlfCrunch) appeared, and I pored over these with great interest. A copy of the CompuServe GIF specification appeared, as well as a copy of gif2-ras.c, a public domain C program written by Patrick J. Naughton. This last program was an implementation of a GIF decoder for use on a Sun workstation.

Armed with all this information, I set out trying to write my own GIF decoder for APAC mode. I initially called this GIFREAD, but later changed the name to APACVIEW to avoid any possible copyright infringement problems.

By June '89 I had a reasonably working version of it, and uploaded it to GEnie (#4432), CompuServe and Delphi simultaneously. This was the first program to also include a ShareWare notice and request for a $5.00 donation.

Money did not start to pour in as I had hoped, but an encouraging few users did reply. Some sent in suggestions, which I included when I could in future revisions. Don Davis, author of the other GIF viewer (ATVIEW8.ARC on GEnie and CompuServe) also sent e-mail with suggestions to APACVIEW. I also began to hear about users whose monitors did not display APAC with any impressive colors to speak of.

Let me note that all my released programs were created with the Atari Macro Assembler on a standard 800 with two disk drives. All are 100% machine language for speed and size. All pixels of the source image are decoded and used to produce the APAC image; no pixels are skipped. This is how I avoid creating jagged edges, and thus create a smoother image.

I am constantly (well, more or less) enhancing these programs by adding new features. The latest version of ILBMREAD (V2.1, #4971 on GEnie) handles all valid ILBM modes. It also allows the user to "zoom in" on any rectangular area of the screen (down to the pixel size of an Atari screen or 80 x 96).

You programmers out there: polish up your latest program and upload it! Users: keep your 8-bit supporting magazine subscriptions up to date!

Federation (of Free Traders)

Steve Kendrick (CDACE)

"Excuse me, trader, perhaps I could interest you in a little Tribble....."

Federation of Free Traders [FOFT] from Gremlin Graphics Software is a space exploration/ conquest game combined with a space flight simulator. While the game has elements derived from previous releases such as Elite, Starglider, Universe, Sundog and Starflight, it has unique elements of its own that separate it from the other packages.

Your main objective is to become the Big Cheese—Admiral of the Federation. You start out with a meager roll of credits and a basic ship, and it is up to you to amass money and fame to entitle you to this rank. There are several ways of achieving this goal, as well as many obstacles standing in your way.

The Federation, of which you are an initiate member, was formed as the expanding star colonies fell prey to marauding pirates. While the organized groups of space brigands have been mostly vanquished, there are still pockets of pirate corsairs that prey on the space lanes, and your ship is just as good as another for booty. Needless to say, a great deal of your income will be spent in fortifying your defensive systems.

Money is your main goal in this game. Exactly how you amass it is up to you, but there are just a few basic schemes to do this. You can ask for missions of various sorts from the FOFT, such as convoy escort and courier. Completing a mission earns you cash as well as advances your rank. You can enter commodities trading, hoping to second-guess the shifting laws of supply and demand. The goods you buy can be sold in orbiting starports (where prices are heavily controlled and available items of trade are determined by local star-law), or take your chances in deep space or planetside, in the black market.

Star travel is a skill in itself. You select your destination from a well-done 3-D galactic map, then zip through hyperspace to the next star (assuming you have enough fuel and drive capacity to go where you want). After you re-emerge into normal space, you must sight the objective planet, as there is only one base in each star system, then cruise toward it until you are given clearance to dock at the FOFT orbital station.

During your trip, you can take a shortcut hop through hyperspace, but in general this part of the game seems needlessly tedious. Although you can time skip ahead, you can't do this upon station approach. Moreover, you must be very efficient on your planetary approach; dither too long and pirates will find you.

When docked with the base, you can use your Gal-Net terminal to contact the FOFT for further orders, trade for goods or read messages and electronic mail on the bulletin board service.

You control your ship with joystick, and access various functions via the keyboard. Space combat and piloting is a skill in itself, and somewhat difficult to master. Unlike most other airplane and space flight simulators, the joystick controls two pairs of thrusters. One pair moves the ship's nose up and down, the other rotates the ship in a clockwise/counterclockwise fashion.

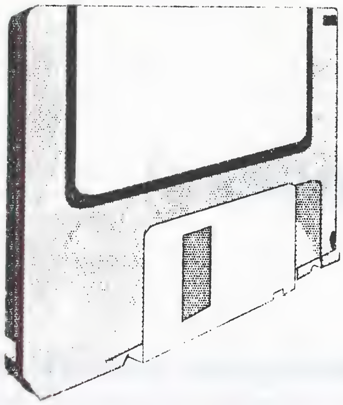
Also, if you don't have one, you will prefer a stick that can be operated one handed (or you can recruit another person to be a keyboard jockey "co-pilot") as there are two keys to control your speed; otherwise you will find yourself expiring in collisions with other ships with alarming frequency.

I have logged quite a few hours at this game, and although I do like it, I have noticed some rather serious flaws that detract from the whole. Forget your high-school physics and astronomy classes for one, as the galaxy you explore belongs more rightfully to Flash Gordon. Each planet seems rather character-less and alike, excepting some numerical attributes on the star-chart.

However, the game is not without its strengths. The graphics are very sharp and realistic, presenting a wide variety of three dimensional craft to encounter, a nice "hyperspace" effect and a detailed interior cockpit. The role playing aspects are most enjoyable; building a bankroll and beefing up your cruiser is the heart of the game, as you almost want to seek out opponents to test your Mark V fusion gun or souped-up engines.

I give this one a favorable review, with reservations. The package as a whole is professional, including the documentation (thin but adequate), *two* posters and a FOFT button.

Happy trading, and don't take any wooden Quatloos!



AIM Disk of the Month August 1990

All files on AIM Disks of the Month are self-extracting LZH archives. To use these programs, simply copy the files onto a disk with free space and double click on the files. The files automatically unARC themselves into the runnable programs.

Here's a short description of the files found on the October '90 disk. For more complete documentation, see the text files contained within most of these archives.

DFIND.TOS—Very fast and easy to use general purpose file finder in both PRG and ACC forms. Wildcards supported include the standard * and ? plus full support for UNIX style [abc], [a-k], and [!abc] wildcards. User controllable output to screen and/or file. ST Careware from Oregon Research Associates.

DFORMAT.TOS—A standalone version of the custom formatter in Diamond Back II in PRG and ACC form. Super fast and reliable, it also formats high density (1.44/1.6 meg) floppies and disks compatible with the Apple File Exchange utility on Mac IIs. Easy to use. Supports Diamond Back II's automatic disk switching/continuation feature.

EROSBILD.TOS—A "fantasy art" animation created by Oliver Saalfeld of Germany. Artwork in this animation was used as the desktop background picture for the DC Desktop snapshot on this month's cover of AIM. Color ONLY. Use Animate4 to load in this SEQ file.

EXAMPLES.TOS—Example programs/dBMAN source code accompanying the October dBMAN TipSTer article by Peter Killian of the O-ACES user group.

FUZZBALL.TOS—This is a Q-bert Clone with good graphics and neat sound effects. Low Res color only.

GFXDEMO.TOS—GFX Demo, a NeXT-style look-alike OS for the ST. Looks very nice! Color ONLY.

GO_BOARD.TOS—The game of GO, with piles of features including play by modem, save game feature and lots more. Includes the seven games of the 43rd Honinbo Tournament. Runs in mono and color (medium res only).

IG214.TOS—Instant Graphics! gives most any BBS graphics POWER! This version adds a new BitBlit command, editable sound effects and commands to build ONLINE MOUSE DRIVEN MENUS. Sysops can create point and click menus! Includes a program to convert GIST sound files into IG script. Sample graphics/sound files included. Supports color and monochrome graphics.

KV_GEO_1.TOS—Do you know the planets?...phases of the moon?...the difference between a meteor and a meteroid? This program lets you browse through pictures of the solar system, click on areas, read and zoom to other pictures. When you think you're ready, take the quiz (3 difficulty levels). Another great piece of educational Shareware from Knowledge Vine. Low res color ONLY.

MEGAFORM.TOS—This copier is shareware and allows [1] read once, write many for multiple disk copies, [2] "Side" copies: use the second side of your S/S disks [3] FAST disk copy. Also has error reporting that proves its worth time and time again. Works on all TOS versions and in mono or color.

PRFMATCH.TOS—Originally retailing for $39.95 from Michtron, Perfect Match is now being sold as Shareware directly from the author. Perfect Match is a Concentration-type educational game. Color ONLY.

QUOTES.TOS—QUOTES is a quoter program (mainly for BBS sysops) with a twist or two. It allows you to have as many data files to pull text from as you choose—and it will write one or many 'destination' files out for you. A typical use is for a quote to be shown at logoff, but you could have it swap your WELCOME screens daily, output random BBS hints or whatever you like.

SIMP_SEQ.TOS—"Bart's Believe It Or Not," a Simpson's animation that is smaller than a single Degas picture! Use Animate4 to view. Color ONLY.

SMRTRACK.TOS—Smart Track is probably the best satellite tracking program you've seen for the ST. Even if you aren't into satellite watching, this is one impressive program. Several data files are included. Shareware. Mono ONLY.

UKROBOTZ.TOS—Save your space station from the robots trying to take over in this fast action PD arcade game from the UK. Great graphics! Low res color ONLY.

UNLZH172.TOS—Version 1.72 of UNLZH, the "fastest extractor for LZH archives." Easy-to-use GEM interface, does multiple archives at once, and automatically extracts to separate folders. Version 1.72 fixes problems with extracting stored '-lh0-' files and extracting archives where the last file is less than 20 bytes.

VALGUS20.TOS—Valgus is a Tetris clone that plays like the stand-alone arcade machine (round by round) instead of the PC version. This one features a two-player mode (player vs. player or player vs. computer). Runs in mono or color!

VECTOR.TOS—This program draws graphs used in algebra and trigonometry. It will plot straight lines, conic sections, absolute values, exponential curves, general and basic trigonometry functions. Designed for the math student, this program is easy to use and draws accurate graphs.

Readers can purchase the October '90 Disk of the Month from their local AIM Participating users group or by sending $6 ($5+$1 shipping/handling) to Unicorn Publications, 3486 Braeburn Circle, Ann Arbor, MI 48108. Please specify the October '90 disk when ordering.

ATARI 8-BIT

SOFTWARE - PARTS AND BOOKS FOR ATARI XL / XE & 800/400 COMPUTERS

1050 MECHANISM

Factory fresh TANDON mechs. make difficult repairs a snap. Units are complete with Head, Stepper, Spindle motor, belt etc. Just plug in, no difficult alignments or adjustments required.

$47.50

POWER PACKS

Exact replacement transformer for 800/400, 1050 810, 1200XL, 850, and XF551 units. Part #CO17945.

$14.50

XL/XE SUPPLY

Power Pak for 800XL,600XL 130XE, 65XE & XE Game.

$25.00

KEYBOARDS

New and complete subassembly.
Easy internal replacement.

130XE/65XE	$35.00
800	$40.00
800XL	$29.50
400	$12.50

XL 40 PIN LSI CHIP SET

A Complete set of 40 Pin Large Scale Integrated Circuits for your 800XL, 600XL or 1200XL computer.

Great for quick repairs! Set contains one each of the following: CPU, GTIA, ANTIC, PIA AND POKEY.

$16.95

800 4 PIECE BOARD SET

Includes Main Board, Power Supply Assembly, CPU Module and 10K Revision B Operating System Module. All boards are new, tested and complete with all components. $28.50

800/400 MODULES

NEW PARTS COMPLETE WITH IC'S

• CX853 16K RAM Module	$9.50
• 800/400 CPU with GTIA	$8.75
• 800 10K "B" OS MODULE	$8.75
• 800 POWER BOARD	$14.50
• 400 POWER BOARD	$9.50

MISCELLANEOUS

600XL 64K UPGRADE KIT	$29.95
13 PIN SERIAL I/O CABLE	$4.50
SPECIAL - 3 I/O CABLES FOR	$10.00
ACE JOYSTICK	$7.95
POWERPLAYER JOYSTICK	$19.95
U.S. DOUBLER	$27.50
400 BOARD SET (W/O Kybd)	$22.95
PADDLE CONTROLLERS	$9.95
REV. "C" BASIC ROM IC	$15.00
RAMBO XL w/o RAM IC's	$27.50
850 or PR MODEM CABLE	$14.50
850 or PR PRINTER CABLE	$14.50
8-BIT MONITOR CABLE	$9.95
PRINTER INTERFACE	$43.95
P:R: CONNECTION	CALL
I/O 13 PIN PC CONNECTOR	$4.50
800XL RF MODULATOR	$9.50
RF CABLE (COMPUTER TO TV)	$3.75
1050 TRACK ZERO SENSOR	$8.50
2793 - 1050 Disk Controller IC	$19.50
850 12pc IC set - all except ROM	$19.50
ANIMATION STATION	$74.95
SUPRA 2400 BAUD MODEM	$124.95

BOOKS

Mapping the Atari (XL/XE)	$24.95
Mapping the Atari (800/400)	$18.95
Compute's First Book of Atari	$12.50
Compute's Third Book of Atari (Includes a high quality type in Word Processor)	$12.50
First Book of Atari Graphics	$12.50
2nd Book of Atari Graphics	$12.50
Graphic Book Combo #1 & 2	$19.95
Electronic Computer Projects	$9.95

Basic Playground Workbook	$5.95

SAMS Repair manuals for 1050, 800XL, 130XE, 800, 400 contain schematics, parts lists, labelled photographs, oscilloscope and logic level readings. $24.95 Each

ATARIWRITER + PLUS WITH SPELLCHECK

Complete Disk based package $29.95

BOOKKEEPER & KEYPAD

You get both Atari's 8 bit professional bookkeeping system and the handy CX85 numeric keypad for one low price. Packages Factory sealed

$19.95 4 DISK SET

VISICALC SPREADSHEET

Unleash the computing power of your 8 bit Atari with Visicalc. Compute everything from home finances to high powered financial projections. Hundreds of uses.

$19.95 DISK

Super DataBase 1-2-3

INNOVATIVE PRODUCT CREATES AMAZING DATABASE APPLICATIONS EVEN IF YOU HAVE NO PROGRAMMING SKILL. ONCE YOU CREATE A PROGRAM WITH SUPER DATABASE IT BECOMES A STAND-ALONE APPLICATION THAT RUNS ON ITS OWN. "GENERATE" YOUR OWN PROGRAMS TO KEEP TRACK OF EVERYTHING.
INCLUDES 137 PAGE MANUAL - 3 DISKS $59.95

PRODUCTIVITY SOFTWARE

• Small Business INVENTORY	$14.95
• AUTO MAINTENANCE	$14.95
• REAL ESTATE RECORDS	$14.95
• MEMBERSHIP RECORDS	$14.95
• APPOINTMENT PLANNER	$14.95
• HOME INTEGRATOR	$17.95

AMERICAN EDUCATIONAL

A+ SPELLING (4 DISKS)	$19.95
A+ LEARN TO READ (3 Disks)	$19.95
A+ READING Comprehension	$19.95

Introducing The New

Diamond Back

Now includes *Diamond Cache!!!*

Listen to what reviewers are saying:

"DIAMOND BACK is a very powerful, flexible program...excellent manual...highly recommended"

David Plotkin - STart

"The overall winner has got to be DIAMOND BACK...it creates GEM compatible disks at image backup speeds...this is the one I use and I use it a lot...It's Dependable!"

LeRoy Valley & Ron Robinson - ST Informer

"If you own a hard drive...then RUN, don't walk, to your nearest Atari dealer and ask him to order Diamond Back!"

Victor T. Albino - ST World

DIAMOND BACK provides a TRUE file backup at image backup speeds with more power and flexibility than all the rest combined! Here are just a few of the features packed into DIAMOND BACK: Easy to use 100% GEM user interface with online help * Backup/Restore ANY number of drive partitions, directory paths, single directories, or specific files in a single pass * Flexible creation of backup sets from different paths or partitions * Wildcard masks to include or exclude files * Incremental backups by date or archive bit (TOS 1.4) * Load/Save custom backup configurations * Automatic drive switching * Full or Partial restore * Flexible disk formatting options * File compression & encryption * Disk usage estimation * Backup to floppies or hard disk partitions * Image backup option * Backup Spectre(tm) partitions * and MUCH MUCH MORE!

DIAMOND BACK was fast, but now it is *FAST.* Introducing DIAMOND CACHE! The most powerful disk cacheing program available for the Atari ST. Diamond Cache is fully user configurable and even includes a flexible print spooler. Of course, all of Data Innovations Diamond products fully support TOS 1.4 extended partitions.

ALSO AVAILABLE FROM DATA INNOVATIONS

FULL COUNT BASEBALL * COURT SIDE COLLEGE BASKETBALL BASKETBALL, THE PRO GAME * 3 IN 1 COLLEGE & PRO FOOTBALL

If you are a sports lover, these are the games for you! Each game is a statistically based simulation using the actual statistics produced by past and present teams on the field and on the court. Each game comes complete with teams from the most recent season, plus great teams from the past and a stats compiler to keep track of your computer league. If your looking for statistically accurate game play in a sports simulation, these are the games for you!

MYSTERY MANSION

Explore a century-old Victorian Mansion. Find hidden rooms, lost treasure, or maybe the rightful heir to the treasure. Mystery Mansion is an entry level and expert level text adventure! The lower floors allow entry level adventurers to explore, but to leave the mansion you will need luck, and the skill learned on previous levels of the Mansion.

ABLE

The Atari Boosters League East (ABLE) meets monthly with enthusiasts and provides user support for all Atari computers except the Portfolio and PC line. The purpose of ABLE is to advance the knowledge of the membership through mutual education and the interchange of ideas.

General meetings are held in the Palm Magnolia Room at the Orlando Public Library, 101 East Central Blvd., on the last Sunday of each month from 1:30 to 4:30 P.M. ST SIG special interest meetings take place in Room 134 at the Bush Science Center on the Rollins College campus on the second Wednesday of each month from 7 to 9:30 P.M. Ad hoc meetings are scheduled as needed to present speakers, conduct special workshops, provide tutorial seminars and for parties. We assist members in service and software problems, as well as arrange group purchases and discounts.

Information is disseminated to members through our newsletter, the ABLE Atari Information Digest (ABLE AID). A package of twelve selected previous issues of ABLE AID higlighting the "super eight" computers is available for $10 ($5 for members). In 1990, ABLE began participating in the Atari Interface Magazine.

We have also established an ABLE Program Library of User Software (ABLE PLUS), consisting of several thousand files for the super eight and sweet sixteen computers. This library contains public domain programs contributed by ABLE members, as well as other computer clubs and users, to allow the sharing of user-written software. A computer specific listing is available to non-members for $3 and disks are available to non-members for $6 each.

ABLE accepts written correspondence at P.O. Box 1172, Winter Park, FL 32790, while membership inquiries are handled by Hadley Nelson, President, (407) 671-0317 or Milton Eager, Treasurer, (407) 834-0581. Annual dues are $12.

ACC.T

Atari Computer Club of Toledo club members receive, as part of their dues, Atari Interface Magazine and access to the 8-bit and ST public domain software libraries. Disks are $2/8-bit and $3/ST, non-members may purchase disks at a slightly higher cost.

A.C.C.T. meets on the second Monday of the month from 7-9 pm at Bassett's Health Foods, 3301 West Central Avenue (Westgate Shopping Center), Toledo, Ohio. 8-BIT SIG (yes, I said 8-bit) held monthly at the home of Jim Herzberg. Dates and times announced at meeting. ST SIG held monthly at the home of David & Brenda Micka. Dates and times announced at meeting.

A.C.C.T. may be contacted at 6107 Greenwycke Lane, Monroe, MI 48161, by calling Dave Micka at 313-241-1157 or Michael Justice at 419-242-7797 or via Fantasy Island BBS.

Fantasy Island BBS (3/12/2400)		419-691-6459

The August ACCT meeting continued the discussion of more direction to the meetings. Everybody agrees something specific needs to done each meeting but there is very little volunteering to arrange things.

Also discussed was the unification of the ST application club with ACCT. Most people involved feel both clubs can benefit from the merger.

Normally September is nomination month for the every exciting and heated races of the elected officers. We may leave the nominations until the actual elections in October. Unless we have an sudden on set of nominees. (Better be there! You may get Elected for something!)

It is easy to become complacent and think it could never happen to you or your club, but...It can. Jan. through July ST Disk of the Month had a virus on it.

First of all it DID NOT come from the AIM disk. It was found on a copy program in our club library. It is a boot sector virus. It is easily eradicated with V-Killer.

I will have the latest version, as of Jan. 1990, at the meetings. All I ask is $1 donation to the club for the disk. Read the directions carefully before executing the kill on your disks. If you have any questions call Dave, Brenda, Mike or me.

Watch for a date for an up coming lectures on viruses. (I'll volunteer somebody to do it!)

Logging off for this month. Good computing to you all!.

Sharon

ACORN
Atari Computer Owners of Rochester New York

The Atari Computer Owners of Rochester, NY (ACORN) meets on the 2nd Wednesday of each month. For the months of August and September, the group will meet at Sunset Recreation, 1317 Chili Avenue, in the town of Chili. (For all you out-of-towners reading this, that is pronounced Chi-lie). A vote is being held to determine a permanent meeting place.

At the August 8th and September 12th meetings, we will have our normally scheduled STarter class for the ST which meets at 6:45 pm, and a Basically Speaking class for the 8-bit which starts at 7pm.

ACORN operates a BBS at (716)436-3078 with 40 megs of public domain downloads for the 8-bit and ST systems. Our mailing address is POB 23676, Rochester, NY 14692.

Dues are $18 per year which includes access to the club's PD libraries, enhanced access to our BBS, and subscriptions to our newsletter, the ACORN Kernel and to Atari Interface Magazine.

Exchange Newsletters	Helen Kiker	(716) 924-4809

September Hi-Lites At our August meeting, the club voted to continue our participation with AIM. After the business meeting, President Don Allis led an excellent discussion of the proper care and maintenance of computer equipment.

We have recently upgraded the equipment on our BBS, and all Atari users are welcome to call. The number is (716) 436-3078 at 3/12/2400 bps.

ATARI FEDERATION

Regular meetings are held at the VAFB Federal Credit Union, Vandenberg Village, Califorina on the first Monday of every month at 7:00 P.M. Dues are $10 for individual or $15 for family membership. The Atari Federation maintains a PD software library for both 8-bit and ST computers.

Vice President	Bob Ribortone
Secretary	Matt Matias
Treasurer	Herb Kanner
Newsletter Editor	Jerry Sullivan
8-Bit Librarian	Chester Hadley
16-Bit Librarian	Charlene Rominger

Atari Federation meeting Aug 6, 1990

Secretary's Report by Matt Matias

Phil opened this month's meeting with a review of new mail: The Glendale Atari show (Sept 15 &16) is looking for volunteers to help out at the show. The ST Journal is out and they are raising their subscription price by $5 (only a couple of our club members have even seen one). More games have been released for the Lynx. The language "Pilot" has been released for the ST. And finally, Phil briefed the members on some of the new software releases in Europe (at least someone is getting new software).

Phil reported his progress on finding the club a 520ST: No great deals yet, but he's still looking. It was also decided that the Sept. meeting is going to be the club sponsored "Pizza Night." So if you haven't been to a meeting in a while, show up for this one!

Bob had some info on START magazine. Apparently they are not putting out a Sept. issue, they plan to use that month to regroup and improve their forthcoming issues.

Other inputs: Paradise Computers is closing their doors on 15 Aug. Also, Jim Wooding is clearing shop. That concluded the formal meeting.

Demos: Paul Alhart conducted the 8-bit demo of Miniture Golf from Antic, which includes a Course Construction capability. The 16-bit demo fell through due to the lack of an RF modulator.

A final note from Herb: We have plenty of 3 1/2" and 5 1/4" disks for sale. Good prices too!

Birmingham Atari Computer Enthusiasts

The Birmingham Atari Computer Enthusiasts of Birmingham, Alabama meets at the Vestavia Hills Library downstairs at 7:00 p.m. the second Monday of each month. Membership dues are $20 for a regular membership,and $35 for a professional level membership.

Mark Bodenhausen	President
James Gilreath	Vice President
Brenda Bodenhausen	Secretary
Steve Yates	Treasurer

For membership information, contact Steve Yates, 1005 Candy Mountain Road, Birmingham, Alabama 35216.

Our BBS is at (205) 833-5012. This is both a voice and data line. To access the BBS, press 1 after the first ring. For voice, press 2. After 6 rings, 2 is automatically selected.

B.R.A.C.E.

Bluegrass Region Atari Computer Enthusiasts

President	Hal Nason	(606) 269-8989
Vice President	Greg Parsons	
Secretary	Chris Dotson	
Treasurer	Vacant	
Librarian	Chris Dotson	
BBS Sysop	Rick Bradfield	

B.R.A.C.E. (Bluegrass Region Atari Computer Enthusiasts) meets the third Sunday of each month from 1 - 4 PM. The site of the meeting is undetermined at this time. The officers will be in contact with you in the future to advise you of the meeting site. Current membership dues are $15 per year for an individual membership, $20 per year for a family membership and $10 per year for an associate membership. (An associate membership includes receiving the monthly newsletter, but excludes the use of the library.) Members of B.R.A.C.E. have extra downloading privileges on The Abyss BBS (606) 223-2782.

BRAG ST

Buffalo Region Atari Group for ST's

CACE

Cascades Atari Computer Enthusiasts

Cascades Atari Computer Enthusiasts is the Atari Club in and around Jackson, MI. The CACE BBS is run by the club and open to everyone. The number to call is (517) 764-4047. Current membership dues are $14.80. Any written communication with CACE should be sent to PO Box 6161, Jackson, MI 49204. Our meetings are held on the second Saturday of the month fro 1p.m. to approx. 4p.m. at the Boos Recreational Center. For more information, contact Brent Fisher at (517) 764-4599.

Central Connecticut Computer Club

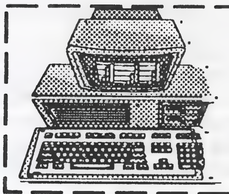
OK....I've been on the run almost non-stop for the last 4 weeks, and pardon me if this is a bit short. We are going to conduct meetings at various members homes for the time being rather than take Joe's time away from him. Face it, why should he stay after at work for a club that really doesn't show up?? The only members to faithfully show up meeting for meeting are the officers! We can do that at my house, for crying out loud.

Anyhow, that's the main poop for this month. The club continues but now we are out of Eastern Computer-Video. IF, and I mean IF....interest develops again we will approach Joe for use of his facilities again.

Next month, for September's meet, I will contact you members and notify you of the meeting location.

This is not a disbanding of the group. There was no friction (that I know of) between us and Joe. I just feel until we grow again as a group, we should let Joe & Co. go home on time at the end of their day. The story by Joe Morando is the start of something positive...more will follow. That's all fer now....see you in September.

Rich Scheidel....da Prez.



CDACC
CENTRAL DELAWARE ATARI COMPUTER CLUB

Central Delaware Computer Club meets on the second Thursday of each month. For more information, contact President Alan Beddow at (302) 678-1450 or write CDACC at PO Box 545, Camden-Wyoming, DE 19934.

CDACE
Capital District ATARI Computer Enthusiasts

Who We Are: Capital District Atari Computer Enthusiasts (CDACE) is located in Albany, NY and serves the tri-city capital region. Meetings are currently held on the third Tuesday for the XE group and the last Tuesday for the ST group at the Computer Cellar, Westgate Plaza, Albany, NY. Meetings begin at 7 PM with the libraries available starting at 6:30 PM. Dues are currently $20 per year for each family. This includes a subscription to AIM, our monthly newsletter and our BBS. Membership is not required to visit a meeting.

President's Monthly:17 August 1990

Well, summer is slowly making way for fall, and hopefully meeting attendance will pick up as outdoor activities give way to more time for everyone to tinker with those now dusty computers. I must admit mine did not get as much attention as I would have liked. Seems about the only major keyboard projects were the wargame articles that have been appearing here in AIM.

Meetings will start covering standard topics again, since we had a lot of info demoed this summer for those who have more than the 64K memory that almost all software uses. One of the more interesting was snap, a program to allow two programs to reside in memory at the same time. Since then I have found out there are several versions of the program, one for hard disk users. I see another article coming to review these fine programs and give credit to the author.

Remember to keep the club in mind as you meet new users, and those who have just not joined yet. A lot of Atari computers are changing hands these days, and the new owners could get information and ideas at the meetings from the demos and just by talking to the more experianced users. Recommend joining the group every chance you get, more members is more information, more ideas, and more fun.

Come to the meetings, and bring a friend Tim

Congratulations to all the officers and thanks to last years group. May we all have a fine year in the GTAUG! The GTAUG has been 'around' since 1981 and supports both the 8-bit and 16-bit communities. Meetings are held the first Tuesday of each month at a location announced in the previous meeting.

At present our dues are $24 per year (Our year begins in September.) and is pro-rated at $2 per month for new members the first year. Since our nearest dealer is 90+ miles away, it is imperative that we support each other. It is for this very reason our group is a fairly close and diverse. We support all facets of Atari computing from 8-bit to Spectre/Mac to IBM and MIDI.

Notes from our July/August Meetings

Well the summer months are the slowest, but our meetings have been quite informative and our attendance quite good.

In our ongoing effort to be a kinder, gentler users group, we have been trying to find ways to increase attendance, revenues and organizational structure to our group. We have bought ST Format, a fine European magazine with disk. These magazines are a part of our library and may be checked out in our monthly meetings as well as through contacting Ray St.Cyr.

Our past two meetings we have had the pleasure of demoing the latest in PD software from home and abroad. The software is definately maturing! There is good stuff out there!!!

Well that's it for now!!! If any of you readers out there have suggestions to build a stronger users group, feel free to write us or address in this magazine. We all must work together for a stronger Atari community!!!

September's meeting is scheduled for the 11th and will be held as usual at the First Federal on Highland Avenue, Beaumont,Texas. Meeting will begin at 7P.M.

Elections will be held and our dues are due! Hope to See you there and please bring your checkbook!!!

Joe B. (GTAUG Secretary)

HACE

The Houston Atari Computer Enthusiasts meet on the fourth Wednesday of the month, 6:45pm at the Health Economics Corporation, 2400 West Loop South, in Houston, Texas. The club supports all Atari computers from the 400 to the Mega4.

Membership is $22 per year, and gives full access to our BBS (713) 458-9923, access to our disk, magazine and newsletter libraries, a subscription to AIM, and our local news journal UPDATE ATARI. There are also other benefits, such as store discounts, door prizes, workshops, telephone help when you have problems, and much more! For more information, please contact one of our officers or drop us a line!

HACE, P.O.Box 460212, Houston, TX 77056

JACS

Jersey Atari Computer Society, P.O. Box 710, Clementon, New Jersey 08021. JACS BBS: (609) 346-1224

President	Mike Hopkins	227-9058
ST Vice President	Maureen Kelly	428-9381
Treasurer	Forrest Blood	877-3579
Recording Sec'y	Gary Mickus	767-1933
Membership Chair	Al Guretse	596-7567

The Jersey Atari Computer Society (JACS) provides a forum through which members may further their understanding and enjoyment of all Atari computers, through the exchange of ideas and information with other users.

JACS holds two meetings per month at the Camden County Library, across from the Echelon Mall in Voorhees, New Jersey. The executive meeting, where all the planning for the club takes place, is held in the 2nd floor meeting room from 7-9 PM (meeting dates vary from month to month). The regular JACS meeting is usually held on the third Tuesday of each month, in the 3rd floor meeting room from 7-9 PM.

Layton ACE of Utah

The Layton Atari Computer Enthusiasts (L.A.C.E.) membership cost $20 per year. Privileges include the AIM Monthly Magazine, access to the 8-Bit and ST club libraries, monthly meetings, help and friendship. If you are presently not a LACE Club member and wish to join contact the one of following persons or write to LACE, c/o Irwin Brooks, 3897 So. 2275 W., Roy, UT 84067-3515.

Irwin Brooks,	President/ST Librarian	(801)731-1516
Richard Clark,	Vice President	(801)825-5823
Ken Karchner,	Secretary/Treasurer	(801)776-8015
Lonnie Allen,	8-Bit Librarian	(801)392-4450

The L.A.C.E. Club Meets in the basement of the Clearfield Library every second Wednesday of the month at 7:00 p.m.

Mark your calendars for the next three meetings: August 8, September 12, and October 10, 1990.

LACE President's Column

HACKERS - Where have they all gone?

In the not-to-distant past, when someone called a person "a hacker" it was a compliment. The term "hacker" was popularly defined as a person who made computers their hobby. They were the ones that knew RAM from ROM, what role an interrupt played in I/O and even what 2 to the 20th power equaled without using a calculator. They were a close-knit group that knew all of the other hackers within a 20 mile radius by their first names. You could commonly find them together discussing a problem or an idea for hours on end. They had a sort of mystic air about them to the rest of the world. They talked funny, would keep weird hours and seemed to get some sort of strange enjoyment for long periods of time with an inanimate object that served no useful purpose (computer). If they weren't deemed harmless, they might have been committed to an insane asylum.

The typical hacker was a polite and nice enough person, but not the kind that you'd expect to host celebrity dinner parties. To hackers, conversations were not free-flowing. If you were to engage a hacker in one, you'd either have to speak their blend of acronymism English or just nod and say "how interesting" a lot. However, they did have their unique and valuable role.

The world needed these computer wizards to do the jobs that the rest of society didn't quite understand. For instance: an elusive system problem, perhaps an accidently deleted, all-important data file or tracking down the critical software bug required a hacker.

That was the picture a short time ago when computers were still new enough that some people thought it was a fad that would pass with time. Now though, in these days of high priced, business- suited computer repairmen, salespeople and analysts, the situation has changed. The pervasive belief is -- computer expertise comes with a high price. While that may be true, it also comes with medium and low costs as well. The trade-off is that they come without the three piece suits, or for that matter even a tie. Although the packaging isn't as fancy, the knowledge may be the same or even better. These lower cost models are the hackers of yesterday. They're the ones that still believe in the art of Boolean algrebra and micro-coding. Where did they all go? Take heart, hackers are still around. It's true that they are now harder to find in this increasingly sophisticated computer world, but when you have a 'serious' problem and a tight budget, you too will go looking for a friendly hacker and be glad you did.

Irwin L. Brooks LACE Club President August 18, 1990

LBACE

The Long Beach Atari Computer Enthusiasts meet on the second Sunday of the month at 6:00 pm. Meetings are held at Mercury Savings and Loan on the corner of Long Beach Blvd. and Carson in Long Beach. Address is PO Box 92812, Long Beach, CA 90809.

President	Richard Hull	(213) 422-1055
Vice-president	John Saunders	863-2582
Treasurer	Pat Connelly	
LBACE BBS		498-8824

Club dues are $20 annually. The club supports both the 8bit and ST. Members have access to the club's PD library and BBS and receive a year's subscription to Atari Interface Magazine.

M.A.C.E.

The Michigan Atari Computer Enthusiasts

Members of MACE receive, as part of their dues, Atari Interface Magazine. Members are also entitled to purchase disks from the 8-Bit and ST public domain software libraries. 8-Bit disks are $3 each, and ST disks are $4 each. As an added bonus, if you purchase three (3) disks from either library you will receive a fourth disk of your choice at absolutely no cost. Non-Members may purchase disks at a slightly higher rate. Mail order is also available.

For a catalog of current disks in our libraries, send $2 to:

MACE, P.O. Box 2785, Southfield, MI 48037

MACE meetings are held on the Third Tuesday of each month at the Southfield Civic Center at 7:30pm. The Southfield Civic Center is located at 10 1/2 Mile and Evergreen Rd, one half mile south of the Evergreen exit on the new I-696. Meetings are in the small pavilion, room 115. Parking is available in the parking garage below the pavilion or in one of the many parking lots on the Civic Center grounds.

If you have any problems with getting to the MACE meetings, please feel free to call on a MACE Officer to relieve you of your confusion. We are always glad to extend a helping hand!

Please come and join us! We are awaiting your visit!

GKAUG Notes: The computer picnic was certainly worth attending. The Kids that were here had the opportunity of using the new playground equipment while the rest of the kids played with various programs.

We spent much of our time looking at and exchanging program files for the Pinball Construction Set by Bill Budge. We started at about 10 am and finally had lunch about 1 pm when the kids complained of hunger pains.

There was an assortment of food as well as the ever popular hamburgers/hotdogs. There wasn't much left over but we didn't finish up until about 7 pm, so we were very productive computer wise and food wise.

One of our next projects is to use the No Frills Software program The Converter to get a few disk of Print Shop Icons converted to Print Power and the New Room format... I am sure that will take some time.

Bryant brought over his Battle Ship modem game. We played that for some time... it takes some time to play, but we all really enjoyed it.

Call me if you want to join us.

Note: Another call from an old member, wants to sell his Atari System, figures that I "KNOW" someone who wants it. My six members already have computers...these are the only members I "know".

Frank Fellheimer (616) 657-6106

MACE Meeting Minutes for July

The July meeting of the Michigan Atari Computer Enthusiasts got underway at 7:50pm. Our special guest was Brian Cassidy, president of WAUG in Windsor Ontario. Mr. Cassidy gave a little speech about an Atari show that WAUG was planning for May 4&5 of next year and invited all to attend. Ed Hanson, MACE President, pointed out that American Atari dealers may be iffy about bringing products to sell at the show due to the import taxes that they would have to pay to bring their stuff into Canada. Brain explained that customs was being given a top priority, and as things stood now, American show-goers would not have to pay any taxes on items purchased from American developers.

Next, Brian Wilmoth gave a demo of the new game Sim City, in which players are made mayor of a city and build it up into an even bigger one while dealing with disasters, crime and other obstacles. Following this, Ed Hanson took over with the evening's main topic, Telecommunications. Ed discussed different modems and software packages to run them, and also disscussed the ups and downs of running a BBS system. Next Ted Newkumet showed off the AIM disk of the month. Following a short break, the meeting was closed out by giving some of the members a chance to try out Sim City. The meeting was called to an end at 9:58pm.

MID-OHIO ATARI USER GROUP

Mid-Ohio Atari User Group Post Office Box 134, Ontario, OH 44862

The Mid-Ohio Atari User Group supports all models of Atari computers. We meet at A&B Computers, located in the West Park Shopping Center on Park Avenue West in Mansfield. Meetings are held the third Saturday of each month from 7:00pm to 9:00pm. Demonstrations are welcomed and pirating is expressly forbidden.

MAUG is a participating club in the Atari Interface Magazine. As such, members receive an issue of A.I.M. each month for no extra charge. Club dues are $7.50 per year for residents of Ohio, and $10.00 per year for others. A monthly disk subscription is an additional $3.00 per year if you pick your disk up at the meeting. Disk subscriptions which must be mailed are an additional $24.00 per year.

The club maintains a disk library for both the 8-bit and ST computers. The library disks are made available at each meeting. There is also a message base on the DataQue Support BBS members to use. Anyone wishing to become a M.A.U.G member can contact Chuck Steinman at the club address or call the DataQue Support BBS at (419) 529-5197 and leave email to the SysOp.

Middle Georgia Atari Users Group

M.G.A.U.G.

The Middle GA Atari Users Group is the sole Atari Club in the Middle Georgia area. We are composed of 60 members of which approx. half are ST users. Club president Pete Miller can be reached by phone at 912-328-8758. The MGAUG address is 115 Feagin Mill Rd., Warner Robins, GA 31088. MGAUG meets the second Sunday of each month at 2 PM at the Warner Robins Library. Annual dues are $5 with the newsletter optional. Use of the club library is free to all paid members.

The August meeting kicked off with a discussion of the upcomming Atari Show at the local Mall. All of the preparations are moving along smoothly for the August 25th show. So far we have 10 members that will be able to make it to the show. We will have Spectre GCR, PageStream, Cad 3D, Wordprocessing, the Hand Scanner and more. The highlight of the August meeting was the 1040STe that Jimmey Howe brought to the meeting. Jim had his 1040STe hooked up with two external speakers to show off the STe's sound. Jims 1040 came with TOS 1.62 installed plus the blitter. He said that many of the games reported by ST Action (A mag. from England) as not working on the STe were working just fine on his computer. One of the games most mentioned was TV Sports Football but Jim said that it worked just fine, perhaps the TOS 1.62 is more compatable than TOS 1.4.

The MGAUG Disk of the month featured two new game demo's, ThunderStrike and Dan Dare III. A program that may be of interest to some of you was PM2DEG. PM2DEG will take a Printmaster graphic and blow it up to screen size without distorting it. You can then save it out as a Degas file. Another little program was Fireworks. Fireworks is a short graphic demo that works in low rez. Just run this program and sit back and watch some Fourth of July blasts. The last program on this month is for monocrome users only. I guess that PACMAN needs no discription. The play is fast and fun with this Mono only game.

After a LONG dry spell we have a new member. David Kelley lives in Warner Robins and is the proud owner of Jimmey Howe's old 520ST with 2.5 Meg. We hope that Dave will be able to make it to all of the meetings.

After some correspondence with the nice folks at Current Notes that I have been having you should all be receiving a FREE issue of their fine magazine. Be sure to read Dave Small's article in this month's issue, "Hey, World Stop Picking on Atari!", and I thought that I was the only one that felt that way. I enjoyed the article so much that I right away called Dave and thanked him for writing it. I'm SO tired of Atari Bashing.

t appears that our AIM issue for August has lost its way somewhere along the line. The fault appears to be mine. When I bought my DeskJet+ I started using full page lazer labels. This makes it necessary for me to ship it in a large full page envelope. Apparently it takes a LOT longer for this to get to the mail than letter size envelopes. The problem has now been rectified but I am not sure of what results we will get. We may get 2 October issues.

Nashville Atari User's Group

N.A.U.G.

Nashville Atari Users' Group P.O. Box 121752 Nashville, TN 37212

NAUG meets on the third Thursday of each month from 7PM to 10PM at the Cumberland Museum and Science Center. Membership dues are $24 per family for the entire year. With your membership you will receive our local newsletter, Atari News, a subscription to Atari Interface Magazine, access to the club's 8-bit & ST Public Domain/Shareware libraries, any group discounts on products, and entrance to all club related functions. We have an Associate Membership for $12 per year. With this membership, you will receive Atari News, AIM and access to our 8-bit & ST PD/Shareware libraries. People joining during or after the month of July pay 1/2 the yearly rate. Visitors are welcome to all meetings.

President & Editor	Walt Sullivan	(615) 228-7353
Treasurer	Michael Gardner	(615) 868-0843
8Bit Chair & Librarian	Jerome Seward	(615) 385-9366
ST Chair & Librarian	Lee Griggs	(615) 356-9071

O-ACEs

O-ACEs is a non-profit group interested in getting more out of Atari computers. We are NOT affiliated with Atari Corp. or any other commercial organization -- we are there for YOU! We cover BOTH 8-bit (including the 400/800, XL, XE, and XEGS series) AND 16-bit (ST series) Atari computers. We meet twice each month (except November and December) on the 2nd and LAST Wednesday each month. Doors open by 7:30 pm at La Vista Recreation Center, 8116 Parkview Blvd. (just off 84th Street, south of Food-4-Less and east of 84th at the light)

FIRST MEETING: (2nd Wednesday) Covers news, views, and decisions that ALL members might be interested in. FOCUS MEETING: (LAST Wednesday) Concentrated information on a single topic (such as word-processing, spreadsheets, music composition, desktop publishing, etc.)

Call 592-5427, for more info on O-ACEs!

Portland Atari Club

Portland Atari Club and the original Eugene ACE

President	Paul D. Gittins	503-667-2403
Vice-President	Ben Smith	
Sec. Treasurer	Mel Anderson	503-232-7231
Membership Sec.	Paul Karczag	503-256-4199
ST Disk Librarian	Randall Leong	503-246-6354
8-Bit Librarian	Jon Johnson	
Sargeant at Arms	Dutch Leanard	
Advisor	Bill Pike	503-646-4471

We of the Portland Atari Club are very excited at becoming members of AIM. PAC is one of the oldest Atari clubs and still has active sections of both 8-bit users and ST members. We currently are available through the ACE of America BBS at 503-285-4417 operating on 300/1200/2400 baud. Club meetings take place the first Monday of the month at the Northwest Service Center on NW 18th and Everett. All are welcome. Meeting time is from 7 pm till 9:30 pm.

At the August meeting David Hunt was installed as BBS director and Ben Smith as Vice-President. Ben will be helping with special projects and demos at out regular meetings.

Our next swap meeting will be held at our November meeting so please pass the word along. Since we do have to pay for our meeting place all non-members will be charged a nominal fee of $10 if they wish to use a table to sell their wares.

Beginning with August, the format for the meeting has been changed. We will be beginning with a very short general meeting of about 15 to 20 minutes. After this we will separate to your choice of 8-bit, ST or just sampling the vendor items. Our goal is to have more fun and give all of you the opportunity to show your software or hardware as well as having a little more time share conversation. Additionally, if you have something you wish to sell you may have the opportunity to demo it on club equipment provided you take the time to answer questions about your stuff.

Since you will probably be reading this article sometime after our September meeting and before the October meeting I would like to invite you to begin thinking about officers for our club for the coming year. Take your best shot but please don't run unless you are sure you can spare the time to do a good job.

We'll see you at the the next meeting!

PORTS ATARI P.A.C.E. COMPUTER ENTHUSIASTS

President	Tracy Hendershot	525-1058
Vice President.	Larry Nadeau	525-7430

STLibrarian	Don Henricksen	729-6309
8bit Librarian	Gary Armbrust	729-6906
ST Coordinator	Geoffrey Bennett	722-3354
8bit Coordinator	Aaron Potopinski	525-1058

Membership to PACE is $30.00 per year or $9.00 per quarter. General meetings are held at 6:30pm on the third Sunday of every month. In the event of a holiday, a new date will be chosen and will be posted within the pages of this newsletter and on local Bulletin Boards. Membership includes a monthly newsletter, monthly meeting, FREE Disk-of-the-Month, access to our BBS, FREE printer ribbon re-inking, and FREE copying priveleges to our VAST collection of 8/16 bit Public Domain programs. Ports A.C.E. is an alliance of families with a mutual interest in the Atari Computer and is an independent, non-profit organization. PACE hardware assets: 130XE, 1050 Drive, MacInker and a Supra 300 baud modem. Any written correspondence should be addressed directly to Ports A.C.E., Tracy Hendershot, 4835 Crosley Avenue, Duluth, MN 55804.

From the President...

It's been enjoyable having a break over the summer months. Car, home and lawn maintenance took up most of my summer; how about yours? Many of us have been in phone contact and several problems that have cropped up were solved. We've also picked up a few new members. Rest assured, we'll be back together in September, stronger than ever!

Our blank disks have arrived and prices have been set at 2/$1.00 for 3.5"; 4/$1.00 for 5.25". We have received several pieces of mail advertising new application software for the 8bit. I will bring them in September. Micro Simulations has moved back to Duluth at the SysOp's new business. The numbers (all 24 hours) are 626-3307, 626-3324 and 626-3325.

The Lynx has been spotted at Children's Palace as of August 9th. It was placed next to Mr. Gameboy in their display case. Two retailers in our area sell the Lynx now. I wouldn't even bother mentioning this, but Atari Corp is in dire need of CAPITAL, and if it's a portable game system that provides it, I won't complain. Atari Corp (ATC) has been establishing a good solid market base in the $5-6 range, and some encouraging sales just could make the stock price shoot up to the ceiling.

For all who have been wanting more information on the TT, here is the latest. I have read conflicting stories on Net-Mail, but from what I gather is that Atari, in its infinite wisdom, has decided that the speed of the TT will be 32 Mhz, not 16 Mhz as planned. A turn in the right direction, I would say. Some Amiga owners are abandoning their machines for the much awaited TT because the cost for the TT is said to be around $1000 less than the similar Amiga 3000. Folks on the west coast are already putting money down at their dealers to be the first to get TTs. October 1st has been the promised release date, however we won't hold our breaths!

See y'all come Sunday, September 16th at the Wisconsin D.O.T. building at 6:30 pm, located near the foot of the Blatnik Bridge in Superior. Ask any officer for directions if you need help locating our meeting place.

For Sale:

Complete Atari Package: Includes Mega 2 with Supra Drive hard disk 30 MB; SM124 monitor; Star NX-2400 printer; Superbase Database and Word Writer software. Used less than 50 hours. $2150. Albany, NY area. Days (518) 383-5597. Evenings (518) 583-3307.

Club Minutes for Sat. August 11,1990 -by Jim Keho

The meeting was called to order at 9am. There were only about 18 members and visitors in attendance. It's gotta be the heat, huh?? Well it'll be cooling down. So come on down!!

SIGs -- Mike Zachary ran a SIG on MIDI w/his system and his MIDI clarinet. Sounded great Mike! If you're interested in running a SIG at a meeting just speak up, you're needed!!

On with general business... Robert spoke about this upcoming October meeting. If all goes as planned we will have one of the Codehead's as our special guest speaker! The authors of Midimax, Maxifile, Hotwire, G+Plus, etc. Lloyd relayed the message from them to us at the meeting, and at least one of them will be able to come. We hope!! Also Thanks Lloyd for contacting them! So you won't want to miss this meeting!

Also the annual swap meet has been changed to Sat. Oct. 27,1990. This isn't official yet!! There'll be more information about the swap meet in the near future, stay tuned! Demos: Dave Thorson demoed the game Tower Toppler. Well that's it for this month, the next meeting is Sept. 8th, see you there!!

President's Particulars

Great demo time at the August meeting! Both 16-bit and 8-bit telecomputing were displayed and some insights and helpful hints were exchanged. Hey, that's what it's about. Then some die-hards stayed to discuss a member's desire to select a printer for school work so I printed a sampler of fonts on my trusty Panasonic. Of course there was the "really serious" test piloting of a flight simulator.

Gearing up for the Most Music Show of the Century with a good MIDI fact sheet (thanx to our resident expert), and some pricing info.

Elections coming up in October so nominate, volunteer, get ready to vote!

October meeting Saturday the 20th. See you RACEdrivers there!

Raleigh Area Computer Enthusiasts

Well gang, here we are! Finally got ourselves into the Atari Interface Magazine. I hope that you all enjoy the magazine since it does have a lot to offer all of us.

In case you did not notice, our name change did go through. We are still referred to as RACE, but the difference is that the A means Area rather than Atari. The reason we are doing this is because in order to promote Atari computers in an area that is so IMB orientated, we needed to drop the Atari out of our name in order to avoid prejudice against our services. Last month's meeting was a great success. Attendance was high, we had nine new members join, and we demonstrated the STe! Our club strives to give you the best support possible but this isn't possible unless you get involved with the club. So, how does the club support you?

1. We provide you with monthly meetings where you can learn many interesting things about the computers that we love so dearly.
2. We have mini-meetings every few weeks between monthly meetings so that we can help each other with software problems, hardware problems or even building hard drives, etc.
3. We offer you Atari Interface Magazine for free! The magazine subscription is free just by joining the club.
4. We now offer you the RACE disks of the month. You get two disks each month. One of the disks contains eight issues of two different online Atari magazines. The other disk will contain great PD & shareware programs. You get 24 disks in one year for just $28 per year. If you are interested in getting this disk subscription, please call Eric Schofield at 851-5134.

So what are you waiting for? Get involved in the club and get the most out of your powerful computer system.

San Diego Atari Computer Enthusiasts

General Meetings are the 3rd Monday of each month at North Park Recreation Center Social Room, 4044 Idaho Street at 7pm. ST/8-bit workshop meetings are held on the 1st Thursday of each month at North Park Adult center, 219 Howard Ave at 7pm. All meetings are open to the public. Annual membership dues are $18 which includes increased BBS access time, AIM subscription and reduced rates on the Disk of the Month. SDACE's address is PO Box 900076, San Diego, Ca 92190.

President	Richard Betson	(619)630-5869
Vice President	Mike Bergman	(619)558-7866
Treasurer	Nancy Rivers	
Disk Librarian	Marc Lawson	
Chief Wizop	Michael P. Odegard	
Editor/Co-Sysop	Steven Kiepe	(619)549-3207
BBS - 24hrs, 300-2400 baud,68MB		(619)689-8157

SDACE is happy to become a participating Atari Interface Magazine User's Group and is looking forward to a long and mutually beneficial working relationship with AIM. There is little to report this month as we just closed out our last regular newsletter prior to the changeover. The big local news is the upcoming Atari Show in Glendale, Ca., September 15th and 16th. Early reports of registered exhibiters indicate a much improved showing is expected over the recent WOA show in San Jose.

SEVAC

South East Valley Atari Connection meets the third Saturday of each month at 10 AM at 3234 S. Fair Ln. (Eaton Business Park, just off of 48th Street and Southern), Tempe, Arizona. Yearly membership is $12.00. Membership includes reduced prices on PD ST and 8-bit libraries and monthly newsletter. Club officers are:

President	Tim Barr	(602)821-1200
Vice President	Marc Dyer	(602)897-0314
Treasurer	Lee Whiteside	(602)962-9415
Secretary	Blaine Nelson	(602)964-1949
Disk Librarian	Mike McKittrick	(602)982-9065
Publication Lib.	Walt Schultz	(602)897-7098

The summer monsoon has arrived and it seems some of you clever people have fled the valley for a time. The treasurer's report shows a balance of $1400. Maybe we should set up a BBS, or have a party, or visit Atari HQ and give them some "advice".

Today we observed a demonstration of Talon Technology's OmniSwitch along with the NEC Multisync 3D. OmniSwitch combines Monitor Master and Drive Master functions along with a multisync adapter in one box which sells for $89 with no cables included. AThe NEC 3D has up to 1024 x 768 interlaced resolution (8514A compatible) and unlike some of the other newer multisyncs, it works fine at CGA (ST medium) resolution.

You may not see this column before the September 15 meeting but Marc is planning a demo of the Datel Hand Scanner and MVG graphic software. Also Tim will show Star Flight and possibly the long anticipated new Word Up.

October 20 will be Utilities I Can't Do Without Day. Bring your favorites. On November 17 we hope to have our local GEnie Sysop here to demonstrate their service. PHAST is planning a visit from either J. Eidsvoog or C.F. Johnson of CodeHead Software. This will take place on October 13 in place of their annual Swap meet.

SPACE

Meeting Notices July 16, 1990 (7:30 - 9:00 PM)

All meetings will be held at the Camp Hill Shopping Mall Community Room until further notice. Currently all dates are set for the 3rd Monday of the month.

STANCE

President	Claudette Tishcler	226-5644
Vice-Pres	Gary	521-2855
Treasurer	Kathi Koenig	892-0881
Newsletter Ed	Joseph Adato	449-6881
Disk Librarian	Barbara Carlstrom	371-2732

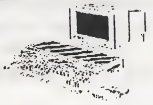
The ST Atari North Coast Enthusiasts (STANCE) is an independent, not for profit Atari computer user group and is not affiliated with Atari Corporation, or any of its affiliates, in any way.

$12.00 per Year with a one time sign up fee of $13.00.

STANCE club meetings are held every third Monday of each and every month at B & G Electronics, (located at 15729 Madison Ave., Lakewood, Ohio 44107) starting at 7:15PM

NEWSLETTER ST Roundtable

Atlanta



STAR (ST Atlanta Roundtable) meets at the Reid H. Cofer Library, 4316 Church St, Tucker, GA at 7:30p.m on the Third Monday of each month. Membership dues are $15 per year. Each member will receive a copy of AIM and a new PD Disk is available each month. For membership info contact Ed Cadow, Claude Brewer Rd, Loganville, GA 30249 or (404) 466-0014.

President	Bruce Hein	(404) 926-0095
Vice Pres.	Les Green	(404) 921-6462
Treasurer	Sidney Ayscue	(404) 320-6560
Librarian	Tommy Mersenger	(404) 938-2718
Newsletter Ed.	Jim Menegos	(404) 473-9885

SAGINAW/TRI-CITY ATARI USER GROUP STAG

The Saginaw/Tri-City Atari User Group meets the last Saturday before the 18th of the month, at 9am, at the Rudy Zauel Memorial Library, on the corner of Center and Shattuck in Saginaw Township.

President	Bryant LaFrenier	(517) 835-2234
ST Librarian	LeRoy Valley	(517) 686-6796
Tres./Sec.	Marty Schmidt	(517) 792-6029
8bit Librarian	Ted Beauchamp	(517) 686-8872

Club dues are only $20, which provides support for both the 8bit and ST, and fill access to the club's Public Domain library, along with a year's subscription to Atari Interface Magazine.

ST CLUB EL PASO

The ST Club of El Paso is the only Atari ST and Mega user group in the El Paso area. The Club has proven to be a benefit not only to new users, but also to the "old hacks" of computing.

We now meet twice a month at the Richard Burges Library, 9300 Diana. The first meeting of the month is always the second Saturday of the month, at 12:30pm. Meetings feature demoes of the latest ST software, as well as help for the those that might be having problems with their computers.

Voting membership is $20 a year, Sponsored and Newsletter only memberships are $15 a year. To become a member of the ST Club of El Paso, call 915-821- 2048, or write the ST Club of El Paso at 10953 Yogi Berra, El Paso, Texas 79934.

President	Tim Holt	915-821-2048
Vice Pres	Morris Miller	594-1906
Sec't/Tres	Joann Anderson	751-2710
Editor	Paul Stampfli	821-4861
Librarian	Norm Bates	593-6234

Salinas Valley Atari Computer Enthusiasts

President	Gary Klugman	758-4894
Vice-President	Dale Meisenheimer	449-7750
Secretary/Tresurer	Charles White	449-8986

Meetings 7:30 P.M., the first Tuesday of the month at the Salinas Community Center.

SWAG
Southwest Washington Atari Group

The Southwest Washington Atari Group was formally created in April, 1985; prior to that, local Atari enthusiasts met on an irregular basis. The group has been holding its meetings at 6:30 p.m. on the last Sunday of the month (save July) at Clark County Fire District #5, Station 3 on 213 NE 120th, Vancouver, WA. SWAG started out with a large following of 8bit owners and as more and more members upgraded to the Atari ST, the membership has become mainly ST owners, but 8bit is still supported. Annual dues are $12 and SWAG can be contacted at PO Box 1515, Vancouver, WA 98668.

Allan Coker	President
Steve Traxler	Vice President
Gary Lentz	Sec/Tres/Librarian
Michael Calvin	Newsletter Editor
The Bear Cavern BBS	(206) 574-1146
Action Annex BBS	(206) 892-8969

TACE
Tinker Ace of Oklahoma

Tinker ACE of Oklahoma meets the first Saturday of each month at 1 PM (12:30 set-up time) in the Moore Public Library, 225 S. Howard, just off of SW 4th and I-35 in Moore. TACE can be contacted at 104 E. Northrup, Midwest City, OK 73110 or at the TACE BBS (405) 755-9561, 24 hrs., 3/12/2400 baud, running Oasis 4.3 software with over 60megs online storage. ST & 8bit support. Dues: Full - $20, Correspondence - $15. Dues are prorated at $1.25/month for correspondence membership and $1.66/month for full membership.

President/VP	Greg Ray	(405) 964-3765
Sec/Treasurer	Stephen Moffitt	(405) 732-8449
Librarian	Chris Hamilton	
BBS Sysop	Rick Spencer	
Technical Advisor	Ron Hamilton	(405) 387-5649

UNYACE
Upper NY Atari Computer Enthusiasts

The Upstate New York Atari Computer Enthusiasts (U.N.Y.A.C.E.) meet monthly at the New York State Electric and Gas building, on Old Vestal Road in Vestal, New York. Meetings are from 7 to 9 PM in the Auditorium. The next meeting date is March 12th.

U.N.Y.A.C.E. had optional dues of $8 per year. Monthly meetings are informal and open to all who are interested in Atari microcomputers.

Contact C. Todd Krissel, President, at (607) 729-4303 or call the Cygnus BBS at (607) 729-5506 (9600 baud, 24 hrs/day) for more information.

RAM

Ventura-RAM, a charter member of ACE-NET, meets the third Wednesday of the month at the Mercury Savings Bank at 1656 Arneill Rd, Camarillo at 7:30p.m. in the Mercury Room. Membership dues are $24 for a full year, pro-rated monthly. Renewals are only $20 a year. Newsletter membership only is $15 a year, pro-rated. For more information on Ventura-RAM, contact PO Box 1513, Camarillo, CA 93011.

President/Newsletter Ed.	Tim McCoy
Secretary	Toni Peters
Treasurer	Mike Portanova

WNY UG

WNYAUG meets at 7:30 pm on the first Thursday of each month in room 116E, Bacon Hall at the State University College of Buffalo Campus, 1300 Elmwood Ave.

Dues are $15 for new members and $12 for renewing members. Send checks and correspondance to WNYAUG, PO Box 59, Buffalo, NY 14216.

President	Mike Husband	(716) 825-8486
Vice President	Kevin Packard	773-9325
Secretary/Treas.	Martin Schlund	689-7873

WACO

WESTMORELAND ATARI
COMPUTER ORGANIZATION

Westmoreland Atari Computer Organization meets the second Tuesday of each month in the North Huntingdon Township Town House, Center Highway and Brownstown Road (just off Route 30 near the Hamilton car dealerships, Irwin, PA) at 7:30 P.M.

Founded in December, 1983, WACO boasts huge ST and 8bit PD libraries. Double-sided disks are only $3 for members, $4 for non-members. Disk catalogs on disk are only $2. The $20 annual membership ($24 for family) now includes a subscription to AIM.

as well as the vocal, consumer-oriented WACO Printout newsletter which features Z*NET. Memberships by mail are welcome.

WACO also operates the WACO Ward BBS, 300/1200 baud. The club was founded to help Atarians support each other. One of the regular features of each meeting is called "Upload" when members share new information or ask for assistance in solving questions. Both 8bit and ST disks-of-the month are demoed as well as new hardware and software.

WAUG!

The Washtenaw Atari Users Group meetings are held every second Tuesday of the month at 7:30 pm in the Michigan Union building on the campus of the University of Michigan on State St. at the corner of S. University in Ann Arbor.

Club dues are $15 per year and provide access to the PD library and subscription to AIM. Meetings feature demos of both 8bit and ST software and hardware. Nonmembers and questions are welcome. Officers can be contacted by calling Craig Harvey at (313) 994-5619 or by BBS at Molin's Den at (313) 420-0407.

The August meeting of WAUG was held on 8/14. Craig rousted everyone to order at 7:40pm by announcing the feature topic: Music.

Dave Brzezinski, Vice President (in Charge of Vice, we assume...) started the show with an in-depth review of the Antic Music Processor v2.0 showing us how it can play standard .AMS file by converting them to .AMP format. Dave seemed particularly pleased that AMP permits the addition of lyrics to music files, but also demonstrated the cut/copy/paste capabilities.

Mike Millage, our indestructible 8-bit Disk Librarian, announced a 3-disk special price of $5 containing Daisy Dot III and some associated fonts as well as the latest version of TextPro. Mike distributed sample printouts of the various fontsets available.

Craig informed the members of continuing progress in the planning of the Windsor/Detroit International Atarifest, announced the next meeting date and invited interested members to attend. Pattie showed a promo in ST World magazine announcing the show which also listed times and dates. Many thanx to ST World!!!

Craig also announced that Dave B. has been looking for a meeting place where better parking is available, but nothing he's found thus far compares to the free room rental we enjoy at the Michigan Union. Other sites on campus are too restrictive to be plausible at this time.

Rick Schrader, club MIDI/Music guru and ex-vice president, brought a rack of unknown hardware upon which he proceeded to demonstrate how music can be created-modified-stretched-folded-spindled-mutilated and otherwise thoroughly improved and/or abused. Rick demonstrated several different software packages, including Music Mouse, while fielding questions from the members. Rick also played some music he found on cassette which contained a variety of Atari sounds from game software. (Nobody really knows where Rick manages to find such things, but it was neat to listen to!)

Bill Rayl, ST Disk Librarian, described the contents of the current AIM disk (lovingly referred to as "WAUG Disk of the Month" by all loyal members...) but was unfortunately stymied by the absence of a working double-sided disk drive when he attempted to demonstrate some of the goodies.

Craig announced we will be raffling the second copy of PageStream during the October meeting. Tickets were sold at $.50 each. (Let's hope Dave B. didn't buy one!)

The meeting was adjourned at 9:45pm. The next meeting will be held on September 11 featuring Games. The October meeting will feature a demonstration of SuperCharger (IBM emulator); for November we have a tentativly Tim Purves from Michtron as guest speaker; and December will be the Christmas Party/Entertainment Night.

ENHANCE GEM

TUI the Textual User Interface

Control your computer using typed commands:
Type one command to execute many with batch files.
Manipulate many files with one command using wildcards.
Send output to screen, printer, a file, or even a program.
Link programs together to perform complex tasks (utility programs included).
It's a desk accessory, giving you an immediate choice: graphical (GEM) or textual (TUI).
Leave its window open and interact with other windows.

PROTECT YOUR DATA

STASH Hard disk backup/restore system

Easy to use, fast, reliable, GEM-based.
Backup all files or only the changed ones.
Automatically formats floppies if needed. • Audible prompting.
Backup files larger than a single floppy.
User-configurable default settings + unlimited number of other configuration files.
Includes utility programs.

New! Version 1.1 for Command Lines!

Q: What's the Most Versatile Way to Print Your Documents and Text Files?

A: Use the Presswork's Assistant Version 1.1!

Stop wasting time loading a wordprocessor or desktop publishing program just to print your files. The Presswork's Assistant loads quickly to give you access to the printing features you need. The intuitive **GEM** interface allows for easy control of margins, headers, page numbers, and other features--all with simple mouse-clicks. You'll never have to touch the keyboard again! Ideal for ".DOC", ".TXT", and "README" files, or most any quick printing job. Best of all, online **HELP** is always just a mouse-click away (GEM mode only).

The Presswork's Assistant version 1.1 is available now for just $10.00 (US). Available only from:

STalker and *STeno*

an unbeatable accessory combination at an unbelievable price: **$30 for both!**

STalker is a complete terminal emulator that does **everything** in the background. *STeno* is a text editor that uses as little as 90K of memory. Both programs utilize the GEM clipboard to exchange data, allowing you to cut and paste between them, and both programs are Moniterm compatible!

***STalker* features:** fast popup menu or convenient ALT-keys for command entry ♦ *background* file transfers ♦ *background* dialing of any group of numbers ♦ separate terminal / RS232 / auto-logon settings for each dialer entry ♦ scroll-back buffer of up to 2000 lines ♦ 20 programmable function keys ♦ VT100 & Atari VT52 emulation ♦ can optionally be used with Shadow™ ♦ capture directly to *STeno* ♦ **New** "Remote Access" (BBS) mode ♦ Easy to use – ideal for new users!

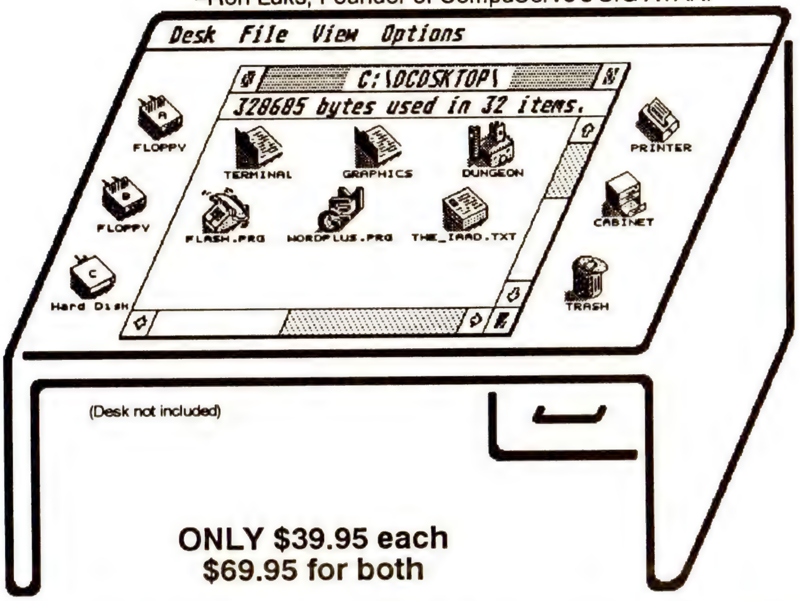
DC DESKTOP

New Programs and Features
ONE LOW PRICE!

"The GEM Desktop just got better"

"DC Desktop is a permanent part of my system."
–Ron Luks, Founder of CompuServe's SIG ATARI



ONLY $39.95 each
$69.95 for both

Enhance, don't replace!

- Place programs & **folders** right on the desktop
- Display unique file, folder and drive icons
- Color icons
- Store frequently used files and programs in our exclusive CABINET virtual disk drive
- Display NEOchrome, Degas, TINY,Spectrum, ART director and Mac pictures from SHOW
- View files at the desktop with an enhanced SHOW routine (with mouse control!)
- Replace the desktop with a pattern or picture
- Recover files from the trash
- Spool/queue printing from desktop or program
- Works in all resolutions, STE and TT too!
- Drop down menu commands via keystrokes
- Load different desktops with a keystroke
- Comes with a command line interface, bootup selector, terminal, icon editor, more
- Special hooks let RAM resident programs be called with one key from DC Desktop
- Completely modular and memory resident – only use what you want!

DC Xtract 2.0 by Paul W. Lee @ Double Click Software     Mode: ARC
```

DC Xtract 2.0 shown. *Throw away your ARC shell!*

- **DC XTRACT 2.0** has it all! **ADD** or **EXTRACT** ARC, LZH, ZIP or ZOO archives! Super-fast 100% assembly! Now everything in one place!
- **DC SQUISH 1.4** now compresses better than ARC and still reduces load time! *Absolutely* 100% compatible with everything!
- **DC SEA 2.0** now creates self-extracting ARC, LZH, ZIP or ZOO files. Also restore the files from the program.
- New programs added.
- **ALL existing programs have been upgraded!**

ARC licensed under agreement from SEA Corp.

ATARI BULLETIN BOARD

by Bill & Pattie Rayl

Bill Rehbock, a sysop of GEnie's new Portfolio Roundtable, has been hired by Atari to replace Charles Cherry. As ST/TT Applications Manager, Rehbock handles much of Atari's developer relations.

US developers have begun receiving TTs, usually a sign that release to the general public is imminent. Most developers, however, have reportedly received 16 MHz versions, while 32MHz versions are on sale now in Germany. In those German machines, it seems that only the CPU runs at 32 MHz and all other functions clock in at 16MHz.

The new TT desktop has a number of interesting added features, such as the ability to place customized file/device icons onto the desktop. You can also define fill patterns and colors to the desktop background *and* to windows. A 'bootleg' version of the TT TOS has been circulating, and reportedly runs on a standard ST or STe. A number of US users have reported to us they received a copy of this "TOS 2.0 Boot Disk" from their local dealer.

Some US dealers have begun selling Atari's CD ROM drive at a list price of $699. There are only a couple CDs currently available specifically for the drive. However, because the drive can read both ISO and High Sierra formats, most IBM and Macintosh CDs are readable by the drive.

Atari had a very strong presence at the Glendale AtariFest held on September 15&16. Thanks to Bob Brodie, developers and many of Atari's technical personnel participated in "debugging sessions" on the new TT. [Ed: We'll have a write-up on the Glendale show, and the WAACE show, in next month's issue.]

Developer News

Artisan Software has announced an updated, paperback version of The Revolution Handbook. The book includes seven new chapters assisting first-time computer buyers in their shopping and a new calendar of events.

For every book sold, $1 will go toward the purchase of Atari computer for schools! The book retails for $14.95, and Artisan is allowing Atari Interface subscribers to buy copies for only $9.95. Artisan Software, PO Box 849, Manteca, CA 95336, (209) 239-1552.

If you need to keep track of your record albums, tapes, CDs or VCR tapes, Software Development Systems has created the Home Entertainment Management System.

This software can easily record everything from cassette tapes to sheet music, print labels for your VCR tapes and cassettes and even keep track of the total value of your collections for insurance purposes. Retail price is $34.95.

The package includes the DataDesk database environment, allowing you to create your own customized modules. SDS, 996 Redondo Ave, Ste. 404, Long Beach, CA 90804, (213) 434-5751.

Diverse Data Products has released 'KX', the Keyboard X-tender, which allows ST owners to easily connect an IBM AT-style keyboard to their systems. The KX interface plugs into the ST's MIDI In port—no need to open your computer! For MIDI users, KX still allows you to leave your existing setup connected by providing a MIDI In plug on their interface.

The software drivers can be installed or deinstalled at any time. Retail price is $74.95. DDP, PO Box 695324, Miami, FL 33269, (305) 651-2393.

Stik-Gripper T.C.S. (Total Control System) is now available from Duggan DeZign. The makers of the popular Stik-Gripper has taken the design one step further, giving your flight simulators "the true 'Flying by the Stick' feeling."

The product is "a rugged, three piece plastic stand which you mount your joystick to and place on your chair." You then sit on the base of the Stik-Gripper T.C.S., which holds your joystick "front and center of you, where you need it!" Retail price is only $19.99. Duggan DeZign, 300 Quaker Lane, Suite #7, Warwick, RI 02886, (401) 823-8073.

Want to prevent dirt and other nasty things from fouling up your ST keyboard? Then get a KeySkin from Computer Supply House! These nifty, thin plastic, see-through covers fit snugly over your ST's keyboard, protecting from spills and dust. Retail price is $25.95, but AIM readers can purchase KeySkins for only $19.95 plus $2 shipping/handling. Computer Supply House, 1112 Second St, Kenai, AK 99611-7210, (907) 283-5837.

The folks at Double Click have been busily upgrading DC Desktop and DC Utilities. New features in DC Desktop version 1.2 include the ability to place folders on the

DC XTract in action!

desktop, color icons, the addition of DC Terminal to the package, the ability to create unique icons for folders and more. Owners of version 1.0 can upgrade for $7.50 for new disk, an extra $7.50 to include a new manual, and $3 S/H. Retail price is $39.95.

DC Utilities programs DC Xtract and DC SEA have been updated to include ZIP, ZOO and LZH file compression formats. You can now use DC SEA to create self-extracting ARC, LZH, ZIP or ZOO files! DC Xtract can now be used to add to, extract or print from, test or view contents of ARC, LZH, ZIP or ZOO archives. Completely GEM-based, DC Xtract does away with the need for separate archive utilities and shell programs. Contact Double Click for upgrade info. Retail price is also $39.95. Both DC Desktop and DC Utilities can be purchased together for only $69.95. Double Click Software, PO Box 741206, Houston, TX 77274, (713) 977-6520.

The CodeHeads have been busy! Following closely on the heels of the release of LookIt and PopIt, the availability of CodeKeys has been announced. CodeKeys is a macro program that records keypresses and mouse actions, allowing them to be played back at a later time. These macros can be edited and saved for future use and can even be set to autorun at bootup time (great for demos!).

You can use CodeKeys to create keyboard equivalents to drop down menu items...just press the defined key combination and you're off! CodeKeys retails for $39.95 (plus $2 S/H US, $3 Canadian, $5 Foreign). CodeHead Sofware, PO Box 74090, Los Angeles, CA 90004, (213) 386-5735.

Migraph has lowered the price of their Touch-Up and scanner bundle by $100. ST owners can now purchase the package for $399. Migraph has a special User Group deal, as well. User groups can purchase a single club package for only $250. To qualify, clubs must send the check along with a letter requesting the 'User Group Atari ST Bundle.' The letter must be on official club letterhead and signed by the club's president.

And finally, Migraph is making an offer to all owners of pirated copies of Touch-Up. Simply send in the disk with your illegal copy along with a check or money order for $79.95 US and Migraph will send you a legal, registered copy of the latest version of Touch-Up. No questions asked. Migraph, Inc., 200 South 3334d St, Suite 220, Federal Way, WA 98003.

Online News

GEnie has instituted its *Star Services plan, a $4.95/month ($5.95 Canadian) flat fee that gives you access to over 100 services during non-prime time (6 PM to 8 AM). You can now send and receive electronic mail, play classic one-player games, access Grolier's Encyclopedia, get closing stock quotes and more at no extra charge. Bulletin Boards for Roundtables such as Science Fiction, Jerry Pournelle, Geneology, Photography and Scuba are included in the flat rate.

While many users seem pleased with this change, a number of others have voiced disapproval. The $4.95 is not an option—users who do not wish to sign up for *Star Services will no longer be able to access GEnie. [Ed: See the club sections at the back of this issue for a "cross-section" of opinions on GEnie's new plan.]

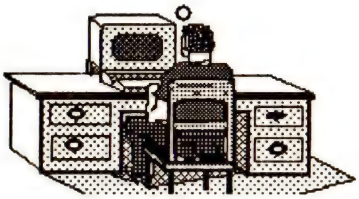
In conjuction with the opening of *Star Services, GEnie has reduced their non-prime time 2400 baud rate from $10 to only $6 US/$8 Canadian. Prime time rates for 300-1200 baud remain at $18 US/$25 Canadian. All areas not covered by the *Star Services—such as the computer Roundtables, all software libraries, LiveWire chat lines and multi-player games—will be charged at these new rates.

The Softsource database is now open to the public free of charge on GEnie. Atarians can search the database for products of interest and, in many cases, download a demo version of the software. Softsource has been created by Atari Corp. to give developers a centralized place to let the public know about their products.

Dan MacNamee, creator of the database, encourages all developers to post information about their products. The Softsource database and accompanying demo programs are planned to be put on a CD ROM in the near future. This CD is to be distributed to Atari stores (and possibly user groups) to help promote developer products. Call GEnie and type SOFTSOURCE to check it out!

Atari's "official" support area for the Portfolio has opened on GEnie, as well. Users of the palmtop PC can access the area by calling GEnie and typing PORTFOLIO.

CompuServe welcomes Bob Retelle as a SysOp in the Atari areas. Readers of AIM will probably recognize Bob's name; he's been a contributor to the magazine since the very first issue. BobR, as he's known online, originally built up the Atari Roundtable on GEnie as its first SysOp. He was also SysOp of the Atari area on Delphi.



EDITORIAL RAMBLINGS

LOOKING BACK

Unicorn Publications celebrates its third anniversary this month! It was back in November of 1987 when we took over publication of Michigan Atari Magazine from John Nagy (now senior editor for ST Journal). Looking at our first issue of that magazine (December '87), it's obvious how far we've come.

That first issue had only eight partipicating clubs. Five of those clubs [GKAUG, GRASS, MACE, TAG (now STAG) and WAUG] are still with us. We lost two of the others (CHAOS and GAG) when we decided to open the magazine up to national participation. The final original club, BCAUG of Battle Creek, MI, unfortunately folded long ago due to lack of Atari support in their area and their officers/members lost faith in the computer's and club's future.

LOOKING AHEAD

It's hard to believe we've come this far! People can now buy copies of Atari Interface Magazine at their local B.Dalton's, Waldensoftware (and hopefully Waldenbooks soon) and other major and independent bookstore chains in the US and Canada. And we plan to expand into overseas sales within the next six months!

Atari user groups continue to be the backbone and driving force of the magazine. Now, with over 50 participating clubs and more contacting us each month, there seems to be no end in sight to how many clubs the magazine will eventually serve.

Although a number of the larger (i.e., expensive) Atari shows are still beyond our budget, we've promoted the magazine at a number of AtariFests this year, including Toronto, Pittsburgh and this month's Chicago show. Next year, we plan to have booths at more of these shows, including the ones scheduled for Windsor, Ontario, Canada in May '91 and Portland, OR in November '91.

While many other magazines supporting Atari 8-bit and ST computers have disappeared or are 'tightening their belts' and shrinking, we're continuing a plan of slow but sure growth.

DECISIONS, DECISIONS

We know some clubs have experienced delays in receiving issues of AIM via the mail. Due mainly to the slowness of third class mail delivery, this is one of the "most heard complaints" we receive here at AIM Headquarters. We are continuing to explore options, such as alternative mailing sources or changing class of mailing.

Which brings us to asking those of you who are participating club members what you'd like us to do. We were hoping in the near future to decrease the price per issue for participating clubs again. However, we could keep the price at 50 cents per issue (hopefully) and move to second class mailing.

Of course, this all assumes that we keep the magazine around its current size. We are starting to feel a little cramped, even with the additional eight pages we've added in the last couple months. Another option would be to increase the size and quality of the magazine, keeping the price per issue at its current level. Increasing the size would allow us to be more creative with the layout while giving you more news, reviews and info for your money.

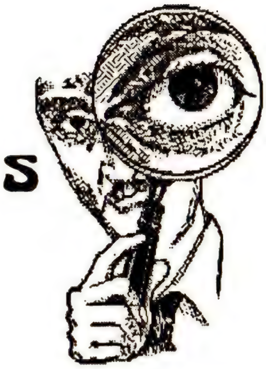
Since first class mailing would cost at least $1.25 per issue, we can't see any way to move to first class mailing and still keep costs to the clubs low. For any clubs wishing to receive their issues first class, we'd be willing to pay for the cost of printing the issues (basically giving the issues free) if you're willing to pay the $1.25 per issue for postage. We doubt we'll have any takers on that offer, however.

Here, in a nutshell, are the options we've come up with:

- Decrease the price per issue to clubs, keeping the size and quality the same
- Keep the price, size and quality the same, but move to second class mailing
- Keep the price and third class mailing the same, but gradually increase the size and quality of the magazine

Participating club members should contact their club officers to cast your vote.

From the Reader's Viewpoint



To the Editors:

As usual, AIM delivered a good magazine with oodles of useful, fun-to-read, well-written information. Without getting too "slobbery," kudos for a job consistently well-done.

Two Opinions

Jay Skotcher makes a very valid point concerning shareware (See the October, 1990 issue). Demos make for far better control of the distribution of a programmer's brainchild than simply giving the program to our something-for-nothing society of the 90s. For those who *do* consider the value of someone else's time and effort, it's altogether too easy to simply forget to forward the expected contribution. (An admission of guilt? Emphatically, *yes*, but I'm getting caught up.)

And here's another boring comment on the tired ol' piracy dilemma. This opinion generated some personal responses—to the negative—when expressed in the Jan./Feb., 1990 issue of Atari Explorer. However, it still seems reasonable that writers and publishers of software should copy-protect their work, and market the programs at a reasonable margin of profit!

As a professional musician and aspiring songwriter, I've found C-Lab's Notator (DigiDesign) to be an indispensable help to making my living. And every single time I boot up that wonderful program, I have to make sure the dongle is sitting in the cartridge port. Seems a small price to pay to make sure that the developers continue to upgrade the program and offer the support that they do. The owner's manual repeatedly states, "Lose the dongle, lose the program." They *will not* replace the key if I lose it. Good!

Enter Mr. X, an acquaintance (friend?) who has been eager to tear the dongle apart to find out how to defeat it. (Of course, he wants to tear *mine* apart. Guess what, guy?)

And there were letters galore chiding me for suggesting (in the Explorer letter) that those who spend months/years developing PageStream and Notator and Calamus and programs of that calibre have the *raw nerve* to pass the costs of protecting their efforts on to We, the Benefactors.

However, the real eye-opener is in the Jan./Feb. 1988 issue of Explorer. Read of an honorable "Consulting Engineer" who makes $100,000 annually, and who feels that "So much software is junke that I can't see paying for it if I don't have to." Or the 48-year-old writer who "doesn't use the packages," but "just [collects] them." Um hmm.... How 'bout the 30-year-old Man of the Cloth who steals to better serve "the Lord's work?" Beautiful.

Although I've never sold any of my musical writing, it *is* all registered with the Copyright Office, and with ASCAP, of which I am a writer member. There is all kinds of protection for my stuff.

Imagine my surprise to walk into a nightclub here in Phoenix and be treated to a performance of one of my songs by an entertainer who lives in Boston, and travels all over the country...*doing my material!* An attorney said there was nothing I can do, and *he* wouldn't do anything because there "wasn't enough in it" for *him!*

But software developers have an edge that the publishing musician is not afforded—developers can, should and must develop foolproof ways to copy-protect their wares, and then *do it!*

Those who realize the worth of a good program will buy it at any reasonable cost, and the creeps who would steal the works (for the most part) will be discouraged for their "craft" by sheer inconvenience. If publications and dealers refuse to advertise programs that can defeat copy protection procedures, and SysOps act responsibly (I suspect most do), legitimate ownership of software might become a little less dependent on morals and ethics.

Truly Yours,
Johnny Harris

PS.Remember Pro-Copy, which *will* copy protected disks?

Dear Editors,

I am impressed with the quality of your newsletter and the expertise of your writers. What I'd really like to know is how Dave Plotkin (Right On Target) rigged switchable ROMS in his Mega as I've got a Pro-Tablet digitizing board that won't run in TOS 1.4. I've heard of it being done but haven't found anyone who actually knows how to do it. If you can twist his arm enough to get it put in print, I think a lot of your readers would benefit greatly.

Steven Kiepe (SDACE)
San Diego, California

[Eds.: Dave, Are you listening?]

Right On Target

David Plotkin

It's early September as I write this, and I have finally found the time to read through the September issue of AIM. I am particularly fascinated by the article written by an admitted pirate. While I don't agree with his methods (can you spell journalistic suicide, boys and girls?), he raises some interesting points.

In the article, the author "justifies" stealing software by saying he only does it so he can try the software out. He maintains that if he likes the software well enough, that is, it meets his needs, he then goes and buys a copy. For anyone who has purchased software only to find it is worthless (or worse buggy!), it sounds reasonable, doesn't it?

In fact, there is software distributed using just such a method. It is called shareware, and you are actually encouraged to copy it and give copies to friends. If you like it, you register the copy, pay some money, and in return get the latest version plus a manual and (usually) support. The catch, of course, is that a large percentage of people never register and pay, so shareware has not been a raging success.

It hasn't done all that badly in the IBM PC world, where the arcane DOS interface makes programs hard to use without a manual. In the ST world, however, shareware tends to be tripped up by that darned easy-to-use GEM interface, often making manuals completely unnecessary and removing the need to register.

The problem remains, however, how do you protect yourself against some of the really terrible software that is out there? One way is to be patient—word gets around that software is unfit, and the company usually either fixes it or self-destructs. However, if you aren't the patient sort (in the ST world it's hard to be patient in the face of very few releases), the temptation is strong to obtain an illicit copy and try it out.

I have to admit, I have done it myself on rare occasions. Now, before you get all indignant, let's see a show of hands of everyone who has *not* pulled this little stunt....no one? I thought so.

You don't have this problem in many other places in everyday life. If you buy a shirt that doesn't fit right, you take it back. Toaster burns your bagel? Take it back. You get the picture. Ideally, then, you should be able to buy a piece of software, try it out for a reasonable length of time, and return it (in resalable condition) to the store or mail order house if it doesn't fit your needs. However, in *real* life, it's next to impossible to find a dealer who will let you do this.

It's not hard to see why. In these days of copy machines and manuals-on-disk, it's so easy to just make a copy of that $200 package and return it. Dealers who had policies allowing a tryout period found that they had turned into a free lending library. Why do you think your local toy store doesn't allow returns of Nintendo cartridges?

Software has been compared to the music industry. It has been said that just as the availability of cassette tapes makes it possible to record LPs and CDs (which has not killed the record industry), copying of disks won't kill the software industry.

There is an important difference here, however. A cassette tape is not the quality of the original record unless you spend considerable amounts of money for a good stereo system and use very high grade (read: expensive) cassettes. Even then, each copy degrades slightly. However, each copy of a software diskette is functionally indistinguishable from the original, and the 100th copy is just as good as the first.

The author of that controversial piece does have a good idea in encouraging product demos—software that functions like the real thing, but is crippled in some way so that you can't just use it in place of the real thing. For example, a

database that only allows 25 records, or a word processor that won't allow you to save your work or has a length limit on the text.

More and more software publishers are providing such demos, but not enough of them are. What you can do, though, is vote with your pocketbook. Favor the products you can try out with demos—the other publishers will get the picture soon enough.

You can also read reviews in this magazine and the others that support the ST market. This is tricky, though. Reviews are necessarily subjective, they represent at least in part the author's opinion. If you intend to use the software the same way as the reviewer, fine. Chances are, though, that you will want to do at least some things differently, so a good review must provide you with all the background on why the author feels the way he or she does.

For example, I read about a word processor recently that was pretty severely downgraded because its index generator was clumsy and it couldn't produce a table of contents. The author of that review was absolutely incensed by this, as he writes books and needs such features. Well heck, I don't need those things for my work, so it didn't matter to me.

Another tricky point is that some "reviews" are very self-serving. I was absolutely amazed to see a "review" in another publication (which shall remain nameless) that was written by the programmer of the software package being reviewed! As you can probably imagine, it was a *glowing* review indeed. In fact, the title was "Why you need xxxxxxx".

Nowhere was there a disclaimer, or a note that the "reviewer" was also the programmer. Now admittedly, this was a rare occurance, but someone who didn't know might run right out and buy this package. There are other subtle ways a review can get biased, so be very careful about trusting reviews.

I don't like piracy. In the long run, it hurts the ST community. But I'm also not a hypocrite—I do have some software in my collection I don't remember paying for. In fact, the reason I became a reviewer in the first place was because I needed a way to get software without paying for it (I couldn't afford everything I wanted) and I refused to steal it.

Not everyone has the knack for being a writer, however, and I've been around long enough that most of the major players know my name and will send me stuff I am interested in. But until a way for people to really try out software is devised, I am afraid that people like the pirates of September will be around—and there are more of them than you might guess!

See you next month.

Don't Be A Solitary Atari.

The largest and longest standing group of Atari® users in the world shares its problems and solutions online every day in CompuServe's Atari Forums. And you can join them.

Find the latest software, like the new desktop publishing program for the ST. Learn how to run Macintosh® and MS-DOS® programs on your Atari. And pick up helpful game tips from experienced players.

Need technical help? Atari personnel and most third-party software and hardware vendors are online every day. You can even provide recommendations as they develop new programs and products. There's no better way to get more out of your Atari.

Ex—Pirate Talks Back

Steven Leser (P3ACE)

I was disturbed at the apparent nonchalance with which the admitted pirate pled his case in last month's AIM. When I was a young teenager, I traded software with my friends; I was, as well, a pirate. But, once I got older, became an adult and realized the true score, I threw out my unauthorized copies and started *paying* for what I wanted.

I am also proud to say that I register my shareware, which is something far too few of us do. My letter is not *all* full of scorn for the pirates, however. I understand where they are coming from in one sense.

Economics of Piracy

The software companies have taken altogether the *wrong* approach to dealing with the piracy issue. Elementary economics tells us that there will almost always be somewhat of a black market. People will always steal to some extent.

If a product that costs $5 to market and sell, and is currently selling for $25, is the victim of extensive piracy, the software company has two options if it wants to continue to sell the product: raise prices so the good customers, who would buy it anyway, foot the bill of the pirates, or it can attempt to lower prices so much so that it becomes better for the majority of pirates to buy rather than steal. Who wouldn't rather have the documentation and the support?

Piracy, as I see it, deals mostly with game software. The *best* game I have ever played on a computer is Falcon. You can mail order it for $23. As far as I am concerned, no game is worth more than that one. We all have our favorites, but the best shouldn't cost more than about $20-$25.

If you look at things objectively, it really becomes clear. Who plays games? Kids for the most part. How many kids do you know that can routinely fork over $35 for a game? The companies are dreaming when they price things as high as they do. Twenty bucks. Or $15 for the less entertaining, but still viable games.

Pirating Productivity Programs Stinks

Piracy of productivity is another realm. If you do this, you are a *real* heel. Games are ever abundant, but how many word processors and such can you use? Do some comparison shopping, and *buy* the best one for you.

Most people don't *use* that much non-PD or shareware productivity software. I use just a few, and I have bought them all. Lattice C, WordWriter, and a few others. Productivity for the ST is *very* reasonably priced. And as I said, you don't get "sick" of your productivity software and need to buy new ones, like you do with games. There is, in my opinion, no excuse for this type of piracy.

Finding a Solution

In conclusion, there is a problem out there. But it will only be solved when both sides stop blaming the other. Let me outline my solutions to the problem....

To the software companies:

#1 Price game software from

$25 on down. More than that is, in my opinion, inviting piracy.

#2 Don't just advertise (which is expensive), send out demo's of your software! Make them self deleting after a few tries, or something like that. Allow people to see what they are buying. I love this one, because it is cheap! Just upload your demo to Atari's BBS in Sunnyvale and the online services, and it will soon be doing the talking for your product all over the country (and world).

To the pirates:

You obviously know what you are doing is wrong and illegal. Try purchasing software that you think is priced right. *Don't* pirate productivity! Join a users group, and ask someone to demo it for you.

We at P3ACE do things like that all the time. If you *really* want to test drive something, someone at your local users group is bound to have it.

If you are satisfying your conscience by telling yourself that stuff is priced too high, ask yourself this one: "when was the last time I registered some shareware that I frequently use?" Most shareware can be registered for about $10.

If you don't even do this, you are kidding yourself. You are a thief!

Piracy on the Atari Seas

George W. Hulseman

The long-winded argument suggesting piracy of software isn't all bad (AIM September 1990) was indeed an eye opener. An admitted pirate, Mr. "Billy Bob Ray," and probably thousands of other Atari users are apparently in the habit of making illegal copies of software under the notion that it is their right to try the software out before making a commitment to buy it.

Such pretzel logic falls apart under scrutiny.

Don't Think Twice, It's Alright

But before going on, I would like to put forth my own theory of why many computer users think it's alright to obtain and use illegal copies of software. Simply put, they don't—think that is. It's not that the so-called "pirates" don't know better, they do. It's the don't think twice, it's alright attitude that prevails here.

Take for example, someone who would never consciously steal from anyone—my mother. She owns a Macintosh and in her collection are several illegal copies. How did they get there?

They were put there by my brother, someone else who doesn't have criminal tendencies as far as I know. My brother, also a Mac user, has gobs of pirated software in his collection, including MacPaint, a music program and several Infocom games. His copies came from his brother-in-law who undoubtedly copied them from his own collection.

Unaware of the Harm

I doubt that any of them gave much thought to the possibility that all this copying is not only illegal, but immoral in the sense that it is stealing from the programmers and distributors who are trying to make a profit in a highly competitive and limited market. This is not a victimless crime, although it may seem that way because the copiers don't see the end result of their actions.

Computer Crooks

These are the same people who make copies of video cassette tapes and think nothing of it. Are they culpable for the crimes? You bet they are. A convicted criminal doesn't get off because he is ignorant of the law. This is already a significant problem in the music industry, worsening with the advent of digital compact discs and now the digital audio tape. It is becoming all too obvious that we are a society of criminals.

But the casual copiers of magnetic and digital data differ from the common criminal in one important respect. They don't get caught. Nor is any effort being made to catch them because of the potentially exorbitant costs involved. Does this make it morally acceptable? I think not. Does it make it socially acceptable? Unfortunately, I think it does.

Back to Atari

Which brings us back to Mr. "Billy Bob Ray" and the Atari issue. Mr. "Ray" represents a different breed. He knows what he does is illegal and damaging to the Atari software market. Yet he does it anyway. His excuse is that he shouldn't have to pay for something that doesn't meet up to his expectations. Sure there is a lot of lousy stuff for the ST out there, but this hardly makes piracy acceptable. There is no "correct" way to steal something as Mr. "Ray" so ineptly insists.

Harming the Atari World

This piracy especially hurts the Atari community. The company's relatively small size makes it a less profitable market for software developers and they are becoming more reluctant to get involved in this limited niche.

Have you noticed? Chalk up another reason why Atari users should not pirate.

The only recourse for software developers is copy protection. There are several different schemes out there; many are annoying, most are ineffective. There are ways to make a "backup" of just about any commercial program.

Most developers have resorted to using a password system where you have look up a specific word in the owner's manual (i.e., see page 46, paragraph three, second word). Or you must match an icon from a specific page in your manual to the one displayed on the screen. These schemes are cumbersome and annoying, but you can hardly blame the developers.

The On-Line Solution

Like "Billy Bob," I purchase most of my software from mail order houses. But instead of trying them out via illegal copy, I often turn to computer publications, such as AIM and Current Notes, and to bulletin board systems to find out if a program is worth buying or not. There are other recourses too. I recently purchased Federation, a space trade simulation from Cinemaware, while shopping on GEnie. After ordering, I came across a review that was less than enthusiastic. I returned the package unopened and exchanged it for Ultima V, which I meant to buy anyway. Origin Systems is a proven winner in my book.

Not that I don't get stuck from time to time. My collection is filled with lemons, the most recent of which is Greg Norman's Ultimate Golf or Shark Attack as it is known overseas. You have to take the good with the bad.

Let He Who Is Without Sin ...

I must admit there is a program in my collection that I tried out beforehand as a copy—Desktop Publisher ST from Timeworks. A friend volunteered it, and I accepted, having not an inkling of what desktop publishing was really about.

Without documentation, however, I was completely lost. I ended up purchasing the program for $79.95 without knowing whether it was worth it or not. It was, by the way. My next purchase could very well be Wordflair which received a favorable review in the September issue of AIM.

So I will not cast the first stone at Mr. "Billy Bob Ray", my relatives, and those who are supplying the illegal copies of commercial software.

But I would like to say this. There is no justification for piracy. Most of us should know better. Careful shoppers can try software out before they buy at most software stores. Or they can turn to computer magazines, informational networks and bulletin board systems.

If you purchase a program that isn't worth the magnetic medium it is printed on, send the message out and warn other users. Write the company and tell them you think it's a dog. The reputable distributors will refund your money or give you credit.

Don't steal it and try to justify the act with a barrage of excuses. It just doesn't copy.

STalker and *STeno*

an unbeatable accessory combination at an unbelievable price: **$30 for both!**

STalker is a complete terminal emulator that does **everything** in the background. *STeno* is a text editor that uses as little as 90K of memory. Both programs utilize the GEM clipboard to exchange data, allowing you to cut and paste between them, and both programs are Moniterm compatible!

***STalker* features:** fast popup menu or convenient ALT-keys for command entry ♦ *background* file transfers ♦ *background* dialing of any group of numbers ♦ separate terminal / RS232 / auto-logon settings for each dialer entry ♦ scroll-back buffer of up to 2000 lines ♦ 20 programmable function keys ♦ VT100 & Atari VT52 emulation ♦ can optionally be used with Shadow™ ♦ capture directly to *STeno* ♦ **New** "Remote Access" (BBS) mode ♦ Easy to use - ideal for new users!

"A **GREAT**, Full Featured Terminal Program" - ST Report #112

ATARI 8-BIT

SOFTWARE - PARTS AND BOOKS FOR ATARI XL / XE & 800/400 COMPUTERS

1050 MECHANISM

Factory fresh TANDON mechs. make difficult repairs a snap. Units are complete with Head, Stepper, Spindle motor, belt etc. Just plug in, no difficult alignments or adjustments required. $47.50

POWER PACKS

Exact replacement transformer for 800/400, 1050 810, 1200XL, 850, and XF551 units. Part #CO17945. $14.50

XL/XE SUPPLY

Power Pak for 800XL,600XL 130XE, 65XE & XE Game. $25.00

KEYBOARDS

New and complete subassembly. Easy internal replacement.

130XE/65XE	$35.00
800	$40.00
800XL	$29.50
400	$12.50

XL 40 PIN LSI CHIP SET

A Complete set of 40 Pin Large Scale Integrated Circuits for your 800XL, 600XL or 1200XL computer.

Great for quick repairs! Set contains one each of the following: CPU, GTIA, ANTIC, PIA AND POKEY. $16.95

800 4 PIECE BOARD SET

Includes Main Board, Power Supply Assembly, CPU Module and 10K Revision B Operating System Module. All boards are new, tested and complete with all components. $28.50

800/400 MODULES

NEW PARTS COMPLETE WITH IC'S

• CX853 16K RAM Module	$9.50
• 800/400 CPU with GTIA .	$8.75
• 800 10K "B" OS MODULE	$8.75
• 800 POWER BOARD	$14.50
• 400 POWER BOARD	$9.50

MISCELLANEOUS

600XL 64K UPGRADE KIT	$29.95
13 PIN SERIAL I/O CABLE	$4.50

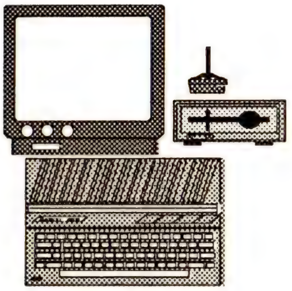
8Bit Support—Alive and Well



Tim Feenstra (GRASS)

When most of us hear the term Shareware, we think of a few titles like Textpro, now up to version 4.54, the whole series of Express terminal programs; BobTerm with version 1.21 now available; Diskcomm 3.2; MyDOS, and TurboBasic. These have become the best programs available for the Atari, at any price.

Even SpartaDOS, the best disk operating system, is only marginally better than MyDOS and more expensive. You could do a lot worse than to find these and other Shareware and public domain programs and base your whole productive computing system around them.

At this point, I guess I should recommend that you consider paying Shareware fees if you use one. This does not include the programs that take up space in a disk box, but those that have proved themselves good and get used all the time. Even if you can not afford the asking price, send them something. Anything will be better than nothing. It will help maintain a healthy and productive programming base capable of giving us some really great software. Enough said.

At a recent GRASS meeting I was impressed with a program brought in by a member called Snapshot, and was interested to find out he got it from a BBS that had a whole section devoted to expanded memory Ataris. I got the number, and called, and sure enough, there was a wealth of programs that allow use of the extra memory for something other than a ramdisk, as well as some nifty little things that have not made it here yet. I will give you the BBS name and number at the end of this article.

I found a screen accelerater, called HYPER_E:, which speeds up screen use a lot. It does cause problems with a couple programs, but if used where it works, it speeds up things more than enough to make it worth the effort to figure out which of your favorites it works with. This program was written by Doug Wokoun.

I also got a ramdisk program to set up a 256K or 320K machine with two ramdisks, configured in single-density, single-sided format. This has uses where Atari DOS must be used because of conflicts with a boot-type program. Called RD78XL, it was written by John Oakley.

From PSI Labs, comes a ramdisk program for use with SpartaDOS that allows you to set the size, something you can't do with the RD.COM file from ICD. PSI RD has uses for those with the need for a specific size RD for their particular needs.

The next two programs make the article I wrote a while back on using a standard ramdisk to run games obsolete. The first is RAMBOOT, from Russ Babylon. This will give you a ramdisk, number one, which will run games without the sector work involved in the method I used to do. To access the real drive one, hold the SELECT key while the access is being performed.

You do need 256K or more for this one, but memory chips are cheap now, so now is the time to put the extra banks in your machine. Great work Russ.

The second program, RAMBOOT2, also requires 256K or more. This one gives you two ramdisks, switchable with the real drives by means of a switch box, called a joybyter, that is easily built from a broken joystick with the included doc file.

This setup has to be an adventure gamer's dream, getting two disk sides to run from ramdisk at the same time. A simple flip of the switches will get the real drives back online, or they can be accessed as their number plus two, that is drive one becomes drive three. Written by Charles Hughes, this has to be about the best game setup I have ever seen, almost perfect.

If you are interested in these two programs, fire up the modem, because I have BBS numbers where they can be reached. Russ can be found on the RATCOM BBS at 301-437-9813. I have not called this one yet, but I will. Charles has two numbers, The Atari Base BBS at (408) 745-5306 or the BAAUG BBS at (408) 986-0215. Call and leave them a little note, they would like to hear your comments to help them with their ideas for more projects.

There is also a program, I got it through the mail, called Daisy-Dot III by Roy Goldman. I think it is probably as good as Print-Shop, but I haven't had either long enough to have formed an opinion. It shouldn't be too long before this one is on BBSes all over.

Now for the good stuff. Except for Daisy-Dot III, I got all this from the Closer To Home BBS in Ohio. It's run by Tom Hunt, an avid Atari buff and a great programmer. I have been calling his BBS for about three weeks now and like to think that we are becoming good friends. He has produced several expanded memory programs all of which have some great potential to Atari users.

He told me (typed, as we have never really talked, yet) that he programs to stay frustrated. What I can tell you about him is he is 34, is the father of three, and has been computing since about 1982, when he bought his first computer, a Vic-20. A friend got him interested in the Atari, and it has ballooned from there.

Always keeping up with the latest in Atari developments, he got on the expanded memory bandwagon even before the 130XE came out, and once it became easy for anyone to upgrade their memory, he set about several projects to get use from this memory.

Maximus, an adventure that stores the map in the expanded banks, was first. He told me a tale of a lose monster which got out of the program proper, and was running rampant through the game code causing lockups from time to time and then unlock all by itself. I think I would have given up about that time.

In 1988, multi-tasking got his interest and MTOS was born. Still available on his BBS, this allows up to four programs to run at the same time, at a slower rate than normal, of course, but no software company would have spent the time and money to develop this for the Atari, let alone one that requires 256K or more.

When MTOS was about as far as Tom thought it could go, he came up with another idea. What if the computer only ran one program at a time, but could switch to another program with the touch of a button? With this Snapshot was born.

There are now several versions that cover almost any hardware setup you could have, but still requires 256K or more. The memory versions of this switch back and forth between a program running and one stored in the expanded banks. You can even use different DOS setups for the two programs. Neat, huh? Well, that is not all!

He has what he calls the hard drive versions, which save the snapshots to a HD or large ramdisk or even floppy. You need about 260 double density sectors for each though, so floppy users will not be able to get the full potential, having ten snapshot available with the touch of a button. In fact, Tom uses his BBS system to program on, and uses Snapshot to quickly switch back when a call comes in.

I have found Tom a great source of knowledge, and he is always there to answer questions I have about his programs. Mainly, I guess I am impressed with his programming ability and the programs readily available to anyone who calls his BBS.

There must be other such programmers, with their works on some other BBS, but it is not readily available to all of us because we do not know the phone number, or even that the BBS exists. What we need is some easily accessed information base that will allow us to find these programmers' work. From what I have found so far, there is now stuff being developed that commercial developers would never have attempted because of the limited user base for some of these ideas.

If you know about one or more of these treasure boards, why not call the Treasure Chest BBS (313) 973-9137, the one AIM uses to keep in touch with its member user groups, and put the information there with a note that this is a special BBS with original works of interest to Atari owners. This will help to bring us all, from all over the country, together now when we need it most. With commercial support on the decline, this private programming segment could keep us in new and promising developments for a long time to come.

The Closer To Home BBS can be reached at (419) 368-4413. Give Tom a call and say hi. Express your appreciation for his efforts to keep the Atari from going the way of the dinosaur. We must unite to provide this service for ourselves. The alternative is a stagnant software base, with very little new products reaching any local area. The rewards are more than even I can imagine, for many minds are still tinkering with ideas new to us, and products that will keep us productive and useful.

A-T-A-R-I

Answers, Tips And Relevant Information

Paul V. Alhart (AFED)

We may feel lost in the shadows lately, but us 8bitters are still around. And you might be surprised by our numbers. "Why then," you ask, "don't we get any support?" Think about it. Why is it so hard to find a new release on 8-track tape anymore? Same reasons. There's more money to be made selling cassettes and CDs.

New Software

Does that mean we won't see any new software for our 8bit computers? Although a sudden flood of new commercial software is about as likely as a comeback of the 8-track, there is still a lot of terrific PD/Shareware software being written.

The biggest problem is in getting it to the users. One of the best methods is through a user group Disk of the Month (DOM). AIM offers a DOM that provides the 16-bit readers with some really great new software.

An 8Bit Disk Each Month?

Could AIM be persuaded to also offer a DOM for its 8bit readers? I don't know what the answer will be or the reasons that there was no 8bit DOM in the first place.

In hopes of encouraging Pattie and Bill, here are some possible responses to their possible answers.

No 8bit equipment at AIM?

Put a couple 8bit programs on the same disk as the 16bit programs. Antic used to put 16bit software on their 8bit disks. The user groups can then strip off the programs using a modem link or possibly by using Transformer.

No 8bit software at AIM?

Just ask. I would be glad to share some of the PD software I have written or collected over the years and I am sure there are many readers of AIM that would be happy to contribute also.

No one is interested.

OK, 8bitters. Let 'em know you are out there and willing to help out by contributing if called upon to do so. AIM is one of the best things to happen to us and our Ataris in some time. Let's all work together and make it even better.

PS: Thanks Pattie & Bill. AIM is super.

Oops

Somewhere between my keyboard and the printing of the June/July issue of AIM some of my data got transmogrified. I hope none of you lost too much sleep trying to figure out the results. Here are the correct AtariWriter+ printer driver locations:

Sector	Byte	Selection	Use
113	7C		Not used for printing
114	1E	A:	825
114	54	B:	1025
114	78	C:	1027
1E1	1A	E:	FX-80
1E2	09	I:	IDS-480
1E2	58	J:	JUNKI
1E3	0D	<RETURN>	Blank
1E3	2B	D:	1020
1E3	47	E:	1029
1E3	6B	F:	XMM-801
1EF	4C	G:	XDM-121

A Comment from the Editors

Paul, we've only gotten a few inquiries about doing a disk of the month for the Atari 8bit. At AIM Headquarters (the spare bedroom in our two bedroom townhouse), you can't find any 8bit equipment, so this hinders us in making up 8bit disks.

We could put a few 8bit files on the ST disk of the month, if people want that and ST users don't mind.

The Atari Computer Clubs of Denver did volunteer to produce an 8bit disk of the month, but we were unsure how to handle the funds, since we offer the disks as a service to clubs and commercially as well.

Plus, one problem that comes to mind with 8bit files on an ST disk is what do the 8bit only clubs do to get the files we've provided on a media they can't use?

We'd like to hear club members opinions on this issue, and how we can resolve it so no one and no club feels left out, overlooked or disadvantaged.

In Search of the Perfect Joystick

Gary Klugman (SVACE)

I never thought of myself as a joystick collector. As I began to review the Best Joystick, I looked over my collection of joysticks. I didn't count the joysticks that I boxed up and put in the garage during the great American computer room purge.

I also didn't include the joysticks I broke, that didn't work or I hated. What I have left are six joysticks that I can't live without. There is one joystick I haven't taken out of the box yet, and a track ball that I've yet to find a use for.

The Perfect Joystick

Like the surfer looking for the perfect wave, I seem to be looking for the perfect joystick. What then constitutes the perfect joystick? For one thing it should be comfortable to hold. After all, who really uses their joystick on their desk? The stick should have a short throw, for faster responses. The users should have a definite feel that he had engaged the stick in a certain direction. A click would be nice. The joystick should not make it hard to find the diagonal directions. It should be durable.

Enter the Best Joystick from Best Electronics. Best Electronics are the same people that brought you the Best Mouse and a number of other upgrades for the Atari computer as well as an endless supply of replacement parts.

The Best Joystick is designed to be hand-held and is roughly rectangular in shape. It has red fire buttons on either side of the joystick, enabling it to be used by both left and right handed players. There is also an auto fire switch on top. It can be used on all Atari computers except the 5200.

It is ruggedly built. Two phillips screws open it up to expose solid construction and easily replaceable parts. Best Electronics keeps the parts in stock for the unlikely repair. Everything inside can be removed with the same screw driver that opened it up.

I used the joystick on a number of games that were joystick intensive. Is it the perfect joystick? No. But, that would ruin the fun of the search. I liked the feel of the base. It was comfortable to hold for long periods. The fire buttons had a longer throw to them than I would have preferred. After extended use my thumb grew tired from pushing them the distance required to activate them.

That looked like something that could be easily improved on by the user, but don't tell anybody I said it. The throw distance on the joystick itself was in the mid-range of the joysticks I use. You can't tell when you've made contact in a specific direction until the game shows you you've done something, or you physically can't push the stick any further.

AUTO FIRE
The Best Joystick
MODEL CX24

Final Thoughts

Don't let me appear too critical. I like the joystick. It will be one of the first ones I pull out when I am playing a joystick game. It would take the qualities of at least 4 of my other joysticks to make the perfect one.

The things I liked least about the Best were at least in the mid-range of the other joysticks. It has the best base of all of them.

Another one of the nice things about this product is that it comes from Best Electronics, a company that's been around, and should be around, for a long time.

I would buy the Best Joystick. It suggested retail is $14.95.

AtariWriter+ XII
For Those Who Don't Want to Read the Book

Jimmy Boyce (CACE)

Well, this time two years ago, we were at the end of the worst draught of the century. This year Bunky and I are building an oil tanker. I just wish they'd figure out how much money the futures market is supposed to bleed out of us for gas.

But that has nothing to do what so ever with creating a record format <pg 66>. First of all, stay away from the [RETURN] key until you are all done creating your own record format. I think a good use for this particular utility is a list of all of your possessions.

You can create a file on disk and put it in a safe place like a lock-box at the bank or a fireproof vault at home. This way, you have a listing of everything in your house. Don't forget to include those little things that a fire destroys like cloth napkins, cosmetics, clothes brush.

You may think this is silly, but when disaster strikes, those items must be replaced and cost money. That is why you have insurance—to cover all of the costs of starting over.

Home Inventory Records

With my lecture for the day over, we shall begin creating a home inventory record format. Insert your AW+ disk and boot up. When the menu appears, depress [M] and follow the directions on the screen. Having gotten to Mail Merge, now press the [C] for—you got it!—CREATE FILE!!! Please notice that you have the default format before your very eyes.

What's that you say Bunky? You want to create your own format? You don't want to use that crazy old default thingamajig?

Relax Bunky, we all have to start somewhere, and this is where we begin depressing the [SHIFT] key and striking the [DELETE BK SP] key. See, all of the garbage is disappearing. Once it is all gone a new message appears at the bottom of the screen. See Bunky, it reads—MINIMUM FIELDS REACHED.

As you and Bunky have already noticed, Home Phone is still there. Not to worry. No! Don't hit return! Now hold down the [SHIFT] key and start striking the [INSERT] key until you have as many lines as you need for your inventory record. Now, still holding down the [SHIFT] key, give the old [DELETE BK SP] key a lick and Home Phone has gone the way the rest of the default format has already gone.

In front of you should be a bunch of lines with a 20 at the end of each one. Arrow back up to the top of the screen and over to the left.

Type in a name for the line—like ITEM for instance—No! Don't type return!!! Arrow down to the next line and type in whatever and so on until you have entered a name for all of your lines.

I left DESCRIPTION until last so I could have several lines to tell about the item I record. Remember, you have fifteen lines maximum with twenty characters per line. Your title names are restricted to twelve characters.

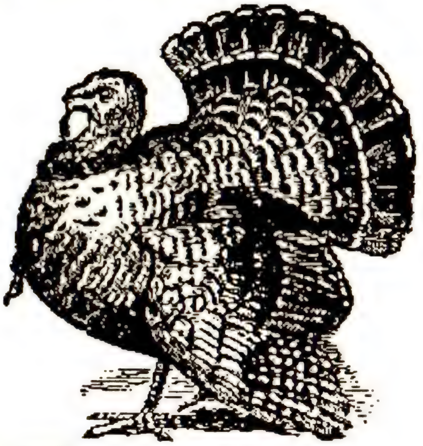
In the book on <pg 67> ignore rule 6; it is wrong. *Do not hit [RETURN] until you have filled in all of the line names in the manner described above.*

To do it their way is a pain in the butt.

Once you have entered your last line name, hit [RETURN] and then when it asks DEFINITIONS COMPLETE, Y/N?, press the [Y] key and ignore the data loss message. Now, you are back at the Mail Merge Menu. *Save your new record format.*

Ok, Bunky, I will go through the steps. First put your pinky on the [S] key and type in your file name at the prompt. Bash the [RETURN] key and it is yours until you screw up.

Next month, we will build a subset <pg 68> and pull off a data base merger. See you next month.



ICD

Ad*Speed*™ ST

ICD reaffirms its position as the leading developer of third party hardware for the Atari® ST with the introduction of ***AdSpeed ST***, a full featured low–cost 16 megahertz 68000 accelerator for all Atari ST, Mega, and ST^{E}* computers.

Almost every operation of your computer will be performed faster.

AdSpeed ST continues ICD's tradition of providing the best product available. These are some of the features that set it apart from the competition.

- Works with all ST models, from the 520 ST to the Mega 4, ST^{E}, and Stacy.
- No mouse, I/O, or blitter conflicts.
- No jumper wires.
- Software selectable true 68000 8 MHz mode for 100% compatibility. Switches speeds on the fly without rebooting the computer!
- 32 kilobytes of high speed static RAM for 16K of data/instruction cache and 16K of cache tag memory.
- Full read and write–through caching for maximum speed.
- State of the art multilayer, surface mount design makes AdSpeed ST the smallest accelerator available anywhere.
- Support for 16 MHz high speed ROM access.
- ICD's famous quality, dependability, and support.

AdSpeed ST is the most effective way to increase the overall speed of your Atari computer. You'll be amazed at the increase in your computer's performance and *your* productivity.

Super Atari Users Group Meeting!

Steve Traxler (SWAG)

Well, here Carl Wirth and I go on what amounts to our first trip to an Atari get-together of this magnitude.

We left Vancouver, Washington about 9:20 a.m., riding in style in his mom's new Suburu Legacy. We drove it to break it in for his mom (grin).

The trip was pretty uneventful. Most of our time was spent keeping up a running dialog. Carl is not only a fellow Atari ST owner and enthusiast, but a fellow worker as well, so we have plenty to chat about.

The weather was fine on the way up, about 75 with sun and patchy clouds. It looks like we should arrive in Seattle around 12:30 p.m. We will try to get some lunch before we get there, but we might be running a little short of time. We are keeping close to the speed limit so we don't get detained for any reason.

Carl and I are both very enthusiastic about this journey. I brought about 50 shareware disks and 10 blank disks just in case we have an opportunity to do some swapping.

We pass Tacoma around noon. The anticipation is mounting as we pass one of my favorite landmarks, the Tacoma Dome.

We decided to make a fuel and food stop just off exit 136. We made a quick right for our gas. With that out of the way, we spotted "Burger Box" just across the street and around the corner. This was an old converted gas station, and I had some reservations about eating there until the smell wafting off the grill hit my nose. The food turned out to taste as good as it smelled. The prices were reasonable as well.

Time was running out, so we wolfed down the rest of our meal and headed on up the highway. The weather was playing musical sun glasses. Looks like we are about 15 minutes behind schedule, (good food takes longer to cook).

Our target exit is 172. We pass exit 161 at 12:59 p.m. I had forgotten how big Seattle is. (One nice thing about being the copilot is that you get to look at the sights).

Exit 172 in sight at 1:11 p.m. The distances shown on the map we had were very misleading. After a period of brief concern that we had gone the wrong way, we finally pulled into the parking lot at 1:30 p.m.

As we entered the Ballard Community Center we located the ticket booth and payed our $2 entrance fee and received our tickets for the raffle.

Just off to the right was a room with seating for over 120 people. Along the walls were lined tables piled high with software and hardware, manned by members of various user groups around the Seattle area. There were STs and 8bit Ataris in abundance, running various programs.

We spent some time browsing through the tables, then were interrupted by a request for everyone to be seated so the meeting could start.

The man holding the microphone introduced himself as Steve Drake, president of Starbase. He told us Bob Brodie would be arriving in about 5 minutes. In looking around, I saw a packed house. Not all of the chairs were taken, but there were many standing up along the walls and sitting at the user group tables.

Bob showed up and there was some humor exchanged as they attempted to get the equipment Bob brought up and running .

Bob began to tell us about how the airlines had explained their late arrival on weather conditions over Seattle. Later when he was in the air, they told him that the reason for the delay was a malfunction in the air traffic control system for Seatac (shudder).

The meeting started with a few announcements regarding a local computer fair booth being set up. With that, they turned the meeting over to Bob. He looked around with a large smile on his face and told us how delighted he was to see such a good turnout and the large number of user groups being represented (here's where I did my part).

Darek Mihocka was one of the developers to show up along with several others. Bob was in the process of telling us about his background as President of an Orange County user group. Bob had worked for Brinks Armored Car Service for nine years when he responded to an opening in Atari's staff.

A ripple of laughter went through the room when Bob told about how long and hard they have been trying to change the toy/game machine image, then Atari comes out with the Lynx.

Games are being released for the Lynx that have one or two meg of data in them. Bob got even more laughter when he referred to the ad currently being run for the

Lynx. Bob then started telling us some info about the Portfolio. He mentioned a plug-in card that goes into the Atari PC clone and then into the Portfolio, and is able to communicate as if the Portfolio were a disk drive.

I would like to mention here that I was struck by the fact that Bob was very much an Atari Enthusiast. (He seems to be a very easy-going type of person.)

The next topic of conversation revolves around the demo Stacy that he brought with him that includes 4 Meg of ram, the serial number 2, and 20,000 miles of airtime. (This brought a ripple of laughter out of the crowd.) He moved fairly swiftly from one topic to the next. He put his endorsement on the Syquest 44 megabyte removable hard disk. Bob uses them all the time and has had very good luck with them.

Bob went on to discuss the STe (now we're hitting close to home). In talking about software development for the STe, he puts emphasis on making use of the new expanded color palette. Bob goes on to say Atari is working on the DMA problem and should be sending some information to the dealers pretty soon regarding a fix.

Discussion turns to the Stacy, and questions are raised as to why it was so slow in getting to the US market. He said one hold-up was the Conner hard drives were auto parking the heads when other SCSI devices were being addressed. Conner came out with a new set of eproms to correct the problem.

A question from the audience voiced concern about the diminishing dealer support and lack of advertising. Bob said Atari plans on advertising the STe and TT. He also addressed concerns for developer support by pointing out that most new Atari/developer communications were being carried out on GEnie, in the form of a Roundtable forum.

To answer questions regarding Atari's financial condition and possible pending move, he indicated that Atari Corp. was in sound financial condition. He also noted that although Atari US answers to Atari Corp., they are separate entities. If there is to be a move, it would be Atari US and not Atari Corp.

Next came answers to questions regarding the TT. Bob seemed reluctant to pinpoint a time, but he said the TT should be available in the US around the time of the Comdex show. Bob mentioned that Moniterm monitors will not be adequate for use with the TT. The TT will be competitively priced with the 80386 clones.

The transputer work station is now being referred to as the ATW, and will sell for around $70,000 (ouch), as a class A machine only. No plans are currently being made for it in the US (sound familiar?).

Bob answers a question about the TT by saying they are trying to make the TT compatible with existing ST software, but problems are many. The mood in the room seemed to change as discussions focused on problems. His answer regarding software incompatibility with the new TOSes and machines was the responsibilty of the developers to fix. The discussion became specific to individual software problems and suggested fixes.

Bob refused to comment on a question about the new Atari laser printer . The Atari CD ROM is now being made available to developers at a "reasonable price."

The question of diminishing 8bit support, (i.e., the demise of the 130XE), was brought up. He answered this question by comparing the price of a 520ST to an 8bit system, and said it was just not economically sound to keep supporting the 8bit machines at the manufacturing level.

By 3:40 pm, the meeting turned to looking at the demo machines that Bob and others had set up, so I wandered over to Darek Mihocka to talk to him about problems I was having with my STe. He wasn't very surprised about my problem with games, (illegal system calls mostly). He did explain that when older STs encounter an IBM format disk with a corrupted directory or FAT table they would give you a window with no files showing. The STe would give you the desktop, but would not open a window.

About that time several other people had gathered around to have their questions answered, so I decided to take this opportunity to go check out the user group tables.

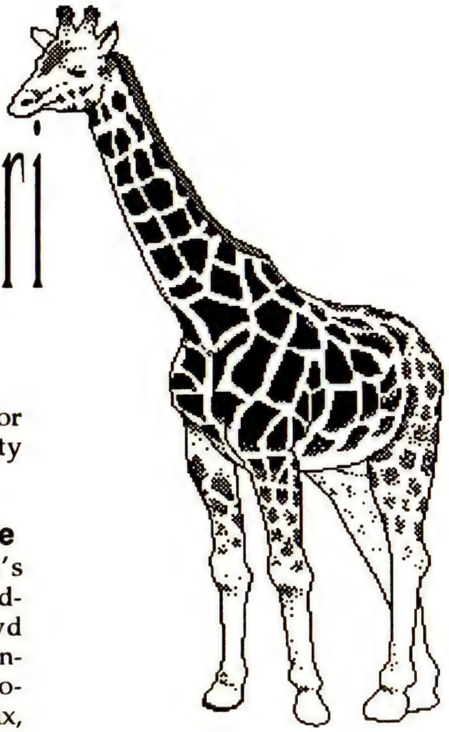
Houston's Atari Safari



Tracy Webber (HACE)

The efforts of the Houston Atari Computer Enthusiasts (HACE), with help from Houston Atari ST Enthusiasts (HASTE), resulted in the biggest Atari show seen in Houston for four or five years.

Saturday, September 1, from 1 to 6 pm saw over two hundred people come through the doors to look at the equipment of six commercial vendors and six user tables and to see and hear the star of the show: Bob Brodie of Atari Corp.

Getting Organized for the Show

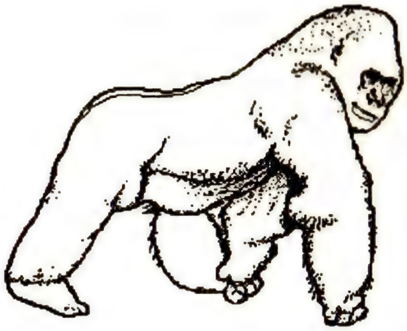
The word of Bob Brodie's trip to Houston was released in early August. With their usual grit and extra effort, the HACE bunch organized the show, contacted commercial vendors, sent out the word on various BBSes, in local ad sheets and local computer stores, reserved the hall, sold tables and contracted for the printing.

Mr. Brodie's host in Houston was Mike Vederman of Double Click Software. The fine folks at Double Click picked up the tab for the meeting room at the Quality Inn.

The Word from Bob Brodie

Mr. Brodie spoke of Atari's plans in the marketplace (more advertising) and teased the crowd with hints of (possible) coming announcements at COMDEX in November. He showed off the Lynx, the Portfolio, two Stacys, the STe and the (Double Click's) TT.

After his 45-minute presentation, including comments about the Atari doings in Europe, the crowd fired 45 minutes of questions at him. Later, he commented that the crowd was "very polite." (We do know our manners in the South.)



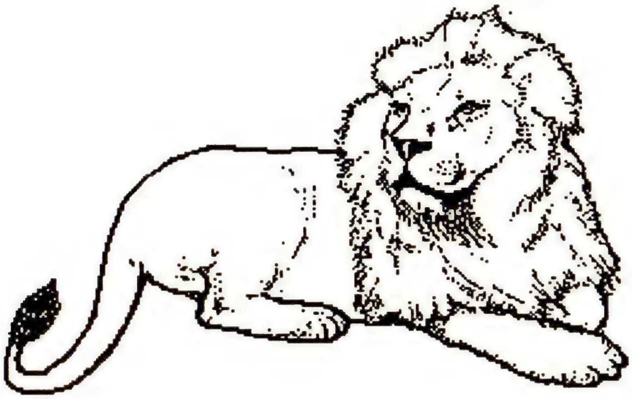
Lots of 8bit software and hardware were in evidence, and sales appeared very brisk.

MegaByte+ (a local dealer) showed some advanced ST hardware modifications (ISAC board and ATspeed). Maxwell CPU (from Louisville, Colorado), Atari-Ville (from San Antonio), Resale Electronics (from Hurst, Texas), and Computer Emporium (from Fort Worth) were exhibiting.

Several clubs from the region were represented. The Austin ACE (AACE), the Golden Triangle Atari User Group (GTAUG, Beaumont, Texas), Computers Are Fun and Educational (CAFE, from northwest Houston), the Alamo Area Atari User Association (AAAUA, from San Antonio), and (even) the Commodore Houston club had members present.

Atari, Double Click and others provided door prizes; drawings were held every hour or so to give away ST (TOS 1.4 upgrade chips and DC Software) and 8bit (Atari Light Pen, Antic w/disc, Analog w/disc, and an Atari cassette recorder) prizes.

This kind of success breeds pride and satisfaction. HACE is planning for a larger show next year; stay tuned.



DMC

OUTLINE® ART

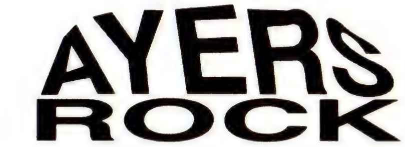
Outline Art is a vector- oriented, graphic generation tool. Multiply your creativity through the many functions which you will find in this program.

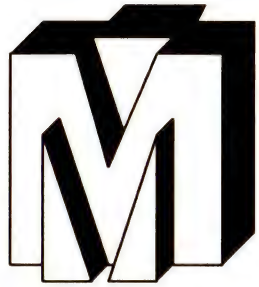
Outline Art supplements the Calamus desktop publishing system with a great number of new functions and effects. An extract from the extensive list of functions include:

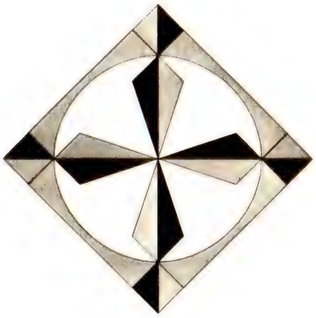
- A user interface, quite similar to that of CALAMUS.
- Complete Vector Graphics Editor for lines, Bezier curves, control paths etc..
- Capabilities to generate freely-definable raster areas.
- Creation of rayed objects, ie; from a font to a central point.
- Nearly unlimited possibilities for the manipulation of text, characters and text attributes such as:
    - rastered, transparent, outlined, rotated, stretched, compressed and cursive styles...
    - circular text and text along a freely-defined vector path...
    - projection of raster areas and text on vector outlines...
    - conversion of text into vector objects...
    - kerning functions...
    - Functions can be freely combined and applied to all Calamus fonts.
- Integrated, fully programable calculator with a pre-defined and extendible library of transformations such as:
    - shift, rotate, mirror, enlarge/ shrink, project onto a sphere (globe, cylinder, cone), etc..
    - An intelligent clipboard and copy functions, allowing the automatic generation of transformation sequences.
    - loading and saving in .CVG format (Calamus Vector Graphic), making possible the integration into and optimal printing through Calamus on all supported output devices in all resolutions.

Convert 2X, our new program to convert CVG (Calamus Vector Graphic) to EPS (Encapsulated PostScript®) or PS (PostScript®) file format is included with Outline Art.

Note : **DynaCADD**, our complete 2D and true 3D Computer Aided Design and Drafting Package, allows the importation of Calamus Vector Graphic format, (CVG), which can then be output through all devices supported by DynaCADD, ie: CAMM-1, Plotters etc,... An excellent solution for the Sign Making Industry.







Outline Art with Convert 2X retails for US $289.95.

Aquanaut on the ST

David Koster (P3ACE)

It's great being a part of the AIM family! Just when things were getting a bit old, the Rayls come through with some software to review. And best of all, it's a game!

Aquanaut is copyrighted by Addictive Games (a division of Prism Software), produced by Fissionchip (think about it) Software, Ltd, published by Miles Computing, Inc. and distributed by Electronic Arts. Who's On First? I Don't Know?! Third base!?!

The game comes with three double sided disks, a "manual" that is pretty much just a hint book, a xerox-proof map, and the usual warranty card/catalog/survey stuff.

The manual presents the scenario in fictional format—a first person report on the mysterious undersea happenings around "Yendor Island." The Aquanauts, an elite team of scuba-commandos, have been called in. They find hyperactive marine beasties, toxic waste, friendly mermaids and alien mutants. What luck.

There are no computer-specific instructions in the manual, not even booting instructions. No playing instructions at all.

The disks are copy protected. In addition, there's this map showing the ocean depth around Yendor Island. It's printed in low-contrast (read nearly invisible) colors. The opening screen gives you latitude and longitude and you have to read the depth at that location off the map and type it in. Not too hard. But if you're going to do that, why not uncopyprotect the disks and let the game be backed-up and played off hard disk?

The first level has the intrepid Aquanaut swimming left and right (and a little up and down) along the "normal" ocean floor. Everything is nicely animated, especially the flip-turns the 'nauts and sharks do when they change direction.

Your guys are equipped with explosive blaster shots. You're up against swordfish, sharks and jellyfish, with dolphins and little fishies thrown in for confusion factor.

You'll not survive until you learn the technique for getting behind things that are following you. There are tools, weapons and additional air along the way. Blow up the aliens' surface installation and you can proceed to the second level...

Which is much harder. You're now in caves under the ocean floor, facing gross mutant beasties. Each has its particular mode of movement and attack, which you have to figure out (and remember!) to make progress. The caves are actually a maze, mapping (from memory, there's no time during play) is recommended.

There are also traps and tricks to test your powers of observation and logic. For instance, you have to shoot a stalagtite to make it fall through the (classified) which blocks further progress. That stopped me for an hour.

There's a peculiar rock formation that indicates the roof's going to fall on you when you go through. It's hard to spot when you're running from something purple and slimey, but it's there.

Haven't completed this level (see below), but I was going great guns for awhile. I'm not that hot on shoot-em-ups, but this one requires more brain than reflex. Most of the time. Don't get me wrong, though, it's not Shanghai! You need your Number One joystick.

On the third level, you actually break into the undersea alien city. The picture on the box shows the Aquanaut sans scuba, walking around in his skivvies, shooting things which look deserving of

being shot. Looks like fun. The reason I haven't gotten to the third level (no, not bad reflexes) is my disks have crashed twice. Looks like the fault of my homebrew disk drives, which use NEC guts.

The problem started when I saved the level I had completed (Access code" in game parlance). You have to do that, otherwise you have to finish the game in one sitting. It works out that the information is saved using tracks 81-82, which are not reliably accessed by the NEC drives. Saving the game trashed the disk. I sent back the disks and quickly got replacement disks. *And* a copy of another Miles Computing game, The Fool's Errand. For the Amiga. I sent the Amy game back with my thanks, impressed with Miles' customer service. I sat down to play Aquanaut again, thinking the Rayls will cancel my subscription if I don't get this review in (grin), and crashed the disks again (hey, I didn't know!).

Another call to Miles, who worked out the problem and offered to send me a special copy with all levels enabled. I've seen enough of the game for this review, so I probably won't bother.

I got something better instead! Those fine folks sent me the ST version of The Fool's Errand, completely unsolicited! You'll see a review of this software soon.

Back to Aquanaut. I was impressed with the graphics and animation. The first level seemed a little slow and simple, but after I got to the second, I realized it was a good warm-up. The docs provide little information on loading or playing the game... part of the plan, I suppose. The problems I had with the disks weren't directly the fault of Miles, but Atari doesn't explicitly support the 80+ tracks, so why use them?

I enjoyed playing Aquanaut, even though it's not really my style. The puzzles are interesting and supplement the arcade aspects well. It's a testament to this balance that I'm tempted to ask Miles for those new disks! Well, we'll see.

HIGH DENSITY DRIVES for the ATARI ST

POWERDRIVE™

Put 1.44 Megabyte Storage in your ST!

The PowerDrive modification board allows you to use standard high density drives that automatically down-grade to standard ST format. Comes with formatting software to format up to 1.7 megs.

Beating Large Drives Into Submission

Robert C. Arp, Jr.

Up front, let me say that although I will mention the Atari Megafile 44 removable hard disk drive in particular, the omission of other brands by name indicates only my lack of knowledge concerning those brands. I've not heard disparaging remarks about any of the removable hard disk drives available for the ST.

Cartridge drives from other manufacturers have been available for some time now, but my having waited for Atari's model should come as no surprise to any reader of AIM or the GEnie bulletin boards.

In addition, I'll also point out immediately that I'm not pushing cartridge drives to the extent that I'd recommend the purchase of one in place of a "standard" (non-removable) drive. I do want you to know that I'm very happy with mine, but I've had it for only one month; therefore, I certainly don't qualify as someone knowledgeable concerning the present state of cartridge drive reliability.

Larger Can Be Better

The focus of this article is certain aspects of large drives and/or partitions in general, not cartridge drives nor the Megafile 44 in particular. Specifically, I shall be directing your attention to the care with which you should choose partition sizes for your hard disks, be they standard or cartridge, and to the subject of file fragmentation—its effects and elimination.

The many other aspects of maintaining hard disk speed and reliability can be studied in a reference such as "The Hard Disk Companion", by Peter Norton and Robert Jourdain; one of my recommendations in a previous article.

Not mentioning "Hard Disk Smarts" by Chris A. Bosshardt in that article was an oversight I'd like to correct at this time. The Bosshardt book is much more likely to satisfy curiosity about hardware than is the Norton/Jourdain book.

Neither of these books discuss cartridge drives in much detail, simply because those drives were neither pleniful nor reliable at the time those books were being written; furthermore, the word expensive hardly expresses the unfavorable cost/benefit ratio of cartridge drives prior to their introduction to ST users.

Indispensable Hard Drives

Speaking of cost/benefit ratios, I'd say that those of hard disk drives compare admirably with those of floppy disk drives nowadays; so, by now, you should be deciding which brand and how big, not when. If the removable cartridges prove to be anywhere near as reliable as floppies, I'll be glad to chuck my floppies, with relish.

In fact, I'd commit to the attestation that hard disk drives have become indispensable computer peripherals; their significance being overshadowed only by monitors. As for printers, their acquisition, compared to that of a hard disk drive, is luxurious.

For my own use, the cartridge drive itself has become the newest indispensable. I consider the fact that the current popular size is 40 or so megabytes to be a personal favor because I find that size to be the most convenient for a programming environment.

The access time of the Megafile 44 is specified to be 34.3 milliseconds. I've seen that some manufacturers claim faster access times, but I suspect they are not adding the latency time to the average seek time.

Latency time is the time required for the platter to rotate so the requested sector is under the read/write head(s); seek time is the time required for the drive to move its head assembly to the selected cylinder and settle. Access time is the sum of latency time and seek time.

Armed with this information, you can question a dealer or manufacturer before you purchase and factor the information you receive into your purchasing decision. There's no reason to fudge the access time figure; 34.3 milliseconds for a cartridge drive is damn respectable as far as I'm concerned.

Maintaining a Hard Drive's Speed

A hard drive's access speed is significant because it is an indication of how rapidly data can be transferred from disk to memory and disk to disk. And while access speed certainly affects a disk's data transfer rate, other influences on that data transfer rate can totally nullify a spectacular access speed.

As you know, data is stored on disk in files; files are stored in directories or subdirectories. Directory and subdirectory organization is but one of those other influences.

Portions of each file are stored in locations called clusters. Clusters are composed of sectors; sectors are composed of bytes, and, of course, bytes are composed of bits. Clusters can be logically contiguous, physically contiguous or both. When a hard drive is formatted with an interleave of 1:1, clusters are physically contiguous.

Only the fastest computers can operate with the ideal interleave 1:1. The ST is one such computer. In the IBM world, you'd need one of the newer 80386 processors to achieve the required speeds. A file's clusters are logically contiguous if, neglecting interleave, each of its clusters is the closest one that it can be.

When a file's clusters are logically contiguous, the file is said to be contiguous. When its clusters are not logically contiguous, a file is said to be fragmented. The same labels are applied to unused disk space.

Files can be written to contiguous free space faster than they can be written to fragmented free space. Contiguous files can be read faster than can be fragmented files.

Files and free space become fragmented during the normal use of a nonstagnant hard disk. A stagnant hard disk would be one in which no alterations ever occurred—no new files would be created, no files would be deleted and the size of the files contained therein would never grow.

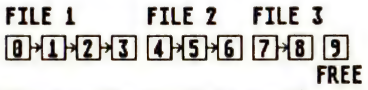
When files grow, the additional clusters required must be allocated from whatever free space is available. If there are other files between a growing file's currently allocated clusters and the free space, then the newest cluster to be allocated will certainly not be contiguous with the eldest cluster allocated. As soon as that new cluster is allocated, the growing file will be fragmented.

When new files are created, clusters are allocated from available free space. When files are deleted or reduced in size, the clusters they occupy become part of the free space. Fragmentation increases with each of these file manipulative processes. There need not be many files on a hard disk before the situation becomes chaotic, with the read/write head spending too much of its time accessing instead of reading or writing.

Subdirectories are simply files that contain information about other files. When subdirectories are fragmented, it may take several head moves just to find a file's first cluster; that's in addition to the moves required to find the subdirectory in the first place.

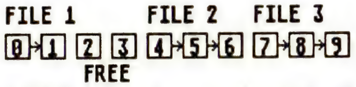
Figure 1 depicts a simplified situation of contiguous free space subsequently occupied by three contiguous files. Initially, the free disk space is one long stream of contiguous clusters. As each file is stored, the clusters it occupies are connected by information in the FAT (File Allocation Table). In figure 1(b), the arrows indicate cluster connections.

a. Contiguous free clusters.

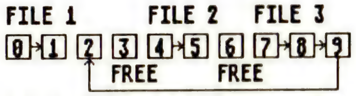


b. Three files; each stored in contiguous clusters.

In figure 2, a fragmented situation develops. As files, or portions of some files are eliminated; and as current files grow, or as new files are stored, both free clusters and those occupied by files become discontiguous (or fragmented).



a. Size of FILE 1 has been reduced to 2 clusters.
Size of FILE 3 has been increased one cluster.



b. Size of File 3 has been increased one cluster.
Size of File 2 has been decreased one cluster.
File 3 is fragmented; free space is fragmented.

Choosing a Partition Size

Bigger is not always better, even when the size being discussed is that of a hard disk. The location of each file stored on disk must itself be stored. Furthermore, since a file is divided into clusters, the location of each cluster must be stored. There are three primary indexes to file and cluster locations; FAT 1, FAT 2 (a copy of FAT 1) and the root directory.

Without boundaries of some sort, the larger the disk, the larger the FATs and root directory. When the first cluster of a file must be located, the search begins in the root directory. After the first cluster is located—in the root directory or in some subdirectory—the next file cluster is located in one of the FATs.

The larger the root directory and subdirectories (if any), the longer it takes to locate that first cluster. The locations of subsequent clusters are found in the FAT; these locations are found much faster than is that of the first cluster.

When a file is being stored, however, subsequent free clusters can be as difficult to find as the first free cluster; search time for all free clusters depends on the extent of fragmentation. Fragmentation also affects FAT search speed when files are altered in size.

The size of each FAT slot depends on the size of the addresses that must be stored in a slot. Each address indexes a chunk of disk memory. The more chunks on the disk, the larger the address (numerically) required to access each chunk.

For example, on a 40 megabyte disk, if cluster size is 512 bytes, there are 78,125 512-byte chunks. Each of the addresses of those chunks would fit in a 3-byte FAT slot. The FAT size would be, neglecting the chunks consumed by the FATs and root directory, 3x78,125=234,375 bytes—a healthy chunk of disk real estate. An even healthier chunk of RAM real estate if the system wants to read in the entire FAT to increase search speed.

Obviously, some sort of compromise is required in order to keep FAT sizes reasonable while permitting disk size to grow. That can be accomplished by letting cluster size increase as disk size increases. For example, if cluster size is increased to 4096 bytes, then there are only 9,766 clusters on a 40 megabyte disk.

The addresses for 4096-byte chunks require only 2 bytes per FAT slot. In this case, FAT size has to be only 2x9766=19,532 bytes. Is there anything wrong with this picture? Depends on your average file size.

Working against us here is "minimum allotable disk space." Every file stored on disk occupies at least one cluster—that's because disk space is allocated by cluster. If a file is 4097 bytes long, it would consume 8192 bytes on this 40 megabyte disk. A file's overbyte is wasted disk space.

Dividing a Large Disk into Partitions

Another way to reduce FAT real estate and increase FAT search speed is to divide that large 40 megabyte disk into two or more small sections, formally called partitions. If the disk were divided into two 20 megabyte partitions, the cluster size for each partition could drop to 2048 bytes; yet there would be no increase in FAT size.

If the cluster size were kept constant at 4096 bytes, then FAT size would decrease and search speed would naturally increase. Dividing the 40 megabytes into four 10 megabyte partitions increases the options. The cluster size could be dropped to 1024 bytes, keeping FAT size and search speed constant, or cluster size could be kept constant to decrease FAT size and increase search speed.

I have many small files on my hard disk, but few large ones; therefore I go for the smaller partitions. I favor a partition size near 4 megabytes for speed, but compromise near 10 megabytes for convenience.

Eliminating Fragmentation

Both free space fragmentation and file fragmentation can be eliminated, temporarily, by simply copying all of a partition's files to a clean partition. The clean partition can be one that is freshly formatted or one from which all files have been erased.

Fragmentation can be only temporarily eliminated because the process begins again as soon as you begin eliminating files and/or portions of files, increasing the size of others or storing new ones.

I am about to describe a program that quickly and safely eliminates fragmentation; but, first, I want to state clearly that you can do the job with system or file selector utilities. It will take you a while, but you'll get the job done, and you can combine the process with generating a backup. Getting both jobs accomplished together will lessen the impact of the time involved. To proceed, you erase all of the files on a destination partition (or sufficient floppies) before you copy to it all of the files on the partition you want to reorganize. To restore your data, unfragmented, simply perform the erase and copy procedure again, using the original partition as the destination.

On the AIM monthly disk, you will find a fragmentation tutorial program, REORGTUT.PRG. This program graphically illustrates the manner in which data storage retrieval speeds deteriorate as files and free space become fragmented; then it pictorially describes reading versus writing optimization.

The defragmentation and optimization program is REORG_HD.PRG. I've designed this program to do one thing—and to do it well. The program uses a proprietary assembly language algorithm to quickly copy all of the files from an origin partition to a destination partition.

From a Seagate 251-1 hard disk partition to a Megafile 44 cartridge partition, the data transfer rate is about 10 megabytes/minute with subdirectory levels about three deep. Since the algorithm spends about half of its time reading and half writing, it is reading 20 megabytes/minute and writing 20 megabytes/minute.

The speed of the algorithm is only slightly dependent on available RAM beyond that required to contain the program plus about 50K bytes for the destination buffer. When data is being moved at 20 megabytes/minute, there's not much time to be saved with a few extra megs of RAM.

Furthermore, there's little time for anything else, such as choosing which files to transfer. The job's done before you can make decisions and selections. That's why I haven't included options to copy less than a partition of data.There are only two run time options. You can choose to zero the destination partition before copy begins, and you can choose the location where the reorganized free space will be collected.

I included the first option because the algorithm must not write data to clusters that are marked bad in the destination partition's FAT. While it is avoiding bad clusters, the algorithm can look out for data occupied clusters just as well.

Therefore, if there is data on the destination partition, REORG_HD will not write over it; nor will it attempt to relocate existing data. So, no problem if you want to merge the data from the origin partition with that on the destination partition.

Using the second option you can optimize the partition's data for reading or writing. If you choose to direct the free space to the beginning of the partition, data will be stored faster. If the free space is sent to the end of the partition, existing data will be read faster.

You can order a disk which contains the fragmentation tutorial and REORG_HD from: Machine Specific Software, 278-1 San Tomas Aquino Rd, Campbell, Ca 94008, (408)370-9039. The disk price is $59.95, check or money order. Shipping charge is $2 for USA, $3 for

Mouse Handling in GFA BASIC

(or, Here MOUSEY, MOUSEX, MOUSEK)

Micheal A. Calvin (SWAG)

First, buy a cat, some Surefire traps, and some cheese.... Oops, wrong kind of mouse!

GFA Basic carries three registers that allow the programmer to find the resident rodent at any time.

Here are the keywords and meanings:

MOUSEK - Which, if any, of the buttons are pressed. 0 = No button pressed. 1 = Left button pressed. 2 = Right button pressed 3. = Both buttons pressed.

MOUSEX - Horizontal screen position in pixels.

MOUSEY - Vertical screen position in pixels.

No matter what the resolution, the upper left corner of the screen is MOUSEX=0, MOUSEY=0. If you create a box on the screen, the graphic coordinates are the same for the mouse.

An Example: BOX 20,20,80,40 will draw a box in the upper left corner of the screen that is 60 pixels wide by 20 pixels high. If you want this box to be an action button, MOUSEX from 20 to 80 is inside, and MOUSEY from 20 to 40 is within bounds.

Ok, now that we know where the little rodent is, and we know which button is pressed, here are some other mouse functions:

HIDEM - Hides the mouse pointer from the user.

SHOWM - Restores hidden pointer.

DEFMOUSE(x) - Change the pointer to one of 7 different internal shapes or a user-defined shape.

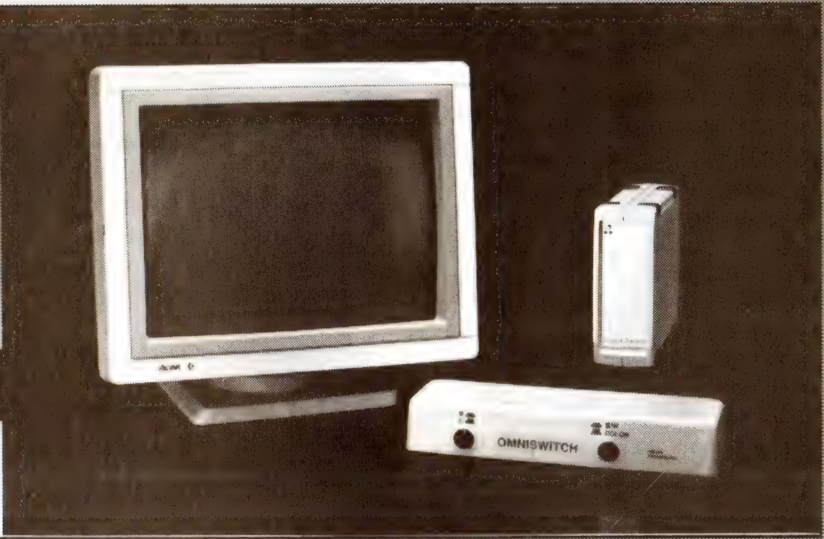
x=0 - Standard arrow
x=1 - Double parentheses
x=2 - Bee (busy)
x=3 - Pointing hand
x=4 - Open hand
x=5 - Thin cross hairs
x=6 - Fat cross hairs
x=7 - Framed cross hairs

(see manual page 322 for info on defining your own pointer.)

The following program will work in high or medium resolution.

```
' (here mousey, mousex, mousek........)
' EEEEEEEEEEEEEEEEEEEK! it's the CAT!
'
RBOX 15,30,80,50
RBOX 14,29,81,51
RBOX 13,28,82,52
'
' Make a round button in the left corner of the screen
'
PRINT AT(4,3);"Button" ! add a label
'
BOX 100,30,190,50
BOX 99,29,191,51
BOX 191,30,215,50
BOX 191,29,216,51
'
' And a box next to it with a number window
'
PRINT AT(14,3);"Mouse Type" ! add a label
PRINT AT(26,3);mouse_type% ! put value in window
'
BOX 230,29,300,50
BOX 232,31,298,48
'
' and another box, the EXIT button
'
PRINT AT(32,3);"Exit"
'
DO ! DO/LOOP to avoid GOTO & labels, think structured.
  '
  REPEAT
    '
    IF MOUSEY>80 ! If user moves out of the active
      HIDEM      ! range, hide the mouse
    ENDIF
    '
    IF MOUSEY<80 ! If back into the active range,
      SHOWM      ! show it again
    ENDIF
    '
  UNTIL MOUSEK ! wait here for a mouse key press...
  '
  x%=MOUSEX ! save typing later, equate the three..
  y%=MOUSEY
  k%=MOUSEK
  ' alternately, use the form MOUSE x%,y%,k% above
  '
  IF x%>224 AND x%<299 AND y%>30 AND y%<50 AND k%
    END ! Find exit box and quit the program
  ENDIF
  '
  IF x%>100 AND x%<200 AND y%>30 AND y%<50
    IF k%=2
      INC mouse_type%
    ELSE
      DEC mouse_type%
    ENDIF
    '
    IF mouse_type%>7 ! limits values...
      mouse_type%=0
    ENDIF
    '
    IF mouse_type%<0
      mouse_type%=7
    ENDIF
    '
    PRINT AT(26,3);mouse_type% ! put value in window
    DEFMOUSE (mouse_type%)
    PAUSE 20 ! wait 20 ticks, so mouse isn't a blur.
    '
  ENDIF
  '
  IF x%>15 AND x%<80 AND y%>30 AND y%<50
    PRINT AT(4,6);"Button and ";
    '
    IF k%=1
      PRINT "Left mouse key     "
    ENDIF
    '
    IF k%=2
      PRINT "Right mouse key    "
    ENDIF
    '
    IF k%=3
      PRINT "Both mouse keys    "
    ENDIF
    '
    PAUSE 20
    '
  ENDIF
  '
LOOP
```

“Super-Charger is the MS-DOS Emulator of Choice” —Milt Creighton *Current Notes Magazine*



Plus Other Outstanding Products for the Atari

Super Charger

- The Only external IBM emulator.
- Norton factor of 4.4.
- Atari's memory can be used as a Ram Disk or Expanded Memory.*
- Runs Windows 3.0.
- Free 1Meg of memory included.
- 1Meg of memory can be used by your Atari as a Ram Disk.
- Free MS-DOS 4.01 included.

$450.00

Omniswitch

- Two monitor ports (DB9 & DB15) allow you to use Multisync Monitors right out of the box.
- Omniswitch functions as a monitor switcher for standard Atari monochrome and color monitors.
- Enables you to use two external floppy drives (2-3.5", 2-5¼" or 1-3.5" & 1-5¼").
- Custom designed software allows you to change resolution without re-booting.

$89.95

Acer Monitor

The Acer multisync monitor model 7015 supports an 800x600 resolution and accepts both "TTL" and "Analog" signals. It has a 14" diagonal display with a .31mm dot pitch. The Acer comes with a tilt swivel base and a non-glare etched screen. The Acer monitor works on all Atari ST** and TT line of computers.

$449.00

*Call for details.

**Requires a monitor interface like the Omniswitch.

PageStream at a Glance

Allan Coker (SWAG)

PageStream, Version 1.8, from Soft-Logik Publishing, allows anyone to become a publisher. You can create any kind of document. You are only limited by your own imagination.

PageStream not only uses columns for text, but what I think one of its greatest strengths, is the use of text as an object. This is text that is not locked into any column and can be placed anywhere on the page. Also you can create a master page that allows you to have consistency throughout the document.

The program has some graphic capabilities but you should have a good graphics program also. You may import artwork from most of the graphic programs out for the ST. Also, you can import text from most of the word processors for the ST.

The problem I have seen most people have is putting the program on their hard drive. You have to copy all the files from the program disk, but PSFONTS must be copied from the font disk. If you are working from only floppies, you must have the fonts that you will be using on your document disk or work disk, not the program disk. The program will bomb out if it cannot find the fonts you are using.

If you are not printing to 8.5x11 paper, you must change paper size in the printer setup on the Global pull-down menu. This is one thing I would like to see changed. I always forget to do this and I get mad when it does not print out the way I think it should.

The manual is clear, with many ideas explaining how to do some of the fancy things. The tutorials help you get started and quickly allow you to become functional with PageStream.

Another good source of information on using PageStream is Radical Type, a bi-monthly newsletter for electronic publishing using PageStream. It covers many things—fonts, macros, different sources of graphics, etc. It is well worth the price of $15 (US) for a subscription.

Their address is Radical Type, PO Box 107, Lazo, British Columbia, VOR 2K0 Canada.

As I said earlier, you can create anything. Here is an example—a one-of-a-kind logo on a shirt.

You produce the logo in PageStream. When you finally have what you want, have PageStream output it for a transparency. This will be a reversed image for use with an overhead projector.

Now you run down and have this xeroxed. Cut out the logo along the outside edge. Glue the copy to the shirt, toner side of the paper toward the fabric, with a transparent washable fabric glue.

After the glue has dried, 24 hours or longer, you wash the paper free leaving the toner bonded to the fabric by the glue.

This is what I meant by you are only limited by your own imagination.

The Cordless Mouse

Gary Lentz (SWAG)

I wrote an initial review of this product for our newsletter. I have now had time to really run the mouse through its paces, as have two other SWAG members.

All of us had some problems with the lag time between moving the mouse and the receiver picking up and sending the signal to the computer. We were able to overcome nearly all this "lag time" with the addition of one of the mouse accelerator programs in the public domain.

The other problem I had was placement of the receiver unit to get the best line of sight between the transmitter (mouse) and the receiver unit.

I rearranged my desk and placed the receiver so that it would be eight to 12 inches away from the mouse. Previously, I was using the mouse with a distance of about four inches separating the receiver and transmitter. One of the other SWAG members located the receiver under his printer which is on a printer stand on his desk. He experienced none of the problems I had.

As I stated in the previous article, the best thing I liked about the mouse was the shape and feel of it. The absence of the sharp corners that are present on the Atari mouse did a lot to cut down on hand and wrist fatigue. Also the absence of the mouse cord, although I kind of miss the cord being in the way all the time (joke), is a really big plus.

I own Monitor Master and Mouse Master from Practical Solutions. I will be adding a Cordless Mouse to those fine products.

We collectively give the Cordless Mouse a B+ rating and if you have considered buying a cordless mouse you should consider buying one of these units.

Disk Directory within BASIC

David Bryant (GKAUG)

This program will list your Disk Directory to the screen while within the BASIC editor. It *will not* alter your BASIC program that is in memory. To use, just type the following line in immediate mode:

```
ENTER "D:D"
```

The screen will clear and the disk directory for Drive 1 will appear. Afterwards you will return to the immediate mode in BASIC. The disk directory will appear in expanded format if using SpartaDOS or the short format if using AtariDOS 2.0 or 2.5. I found it handy to be able to do this without exiting to DOS first with DOS 2.5.

The program is nothing more that a one line statement in BASIC. It does not contain a line number, so after ENTERing the program it is executed immediately. Since it does not have a line number, it is not added to any existing program you may have in memory, nor does it take up any additional memory from your program.

```
B=0:? CHR$(125):CL. #1:O.
#1,6,128,"D:*.*":F. C=1 TO
999:GET #1,A:? CHR$(A);:IF
A<>155 OR B<>83 THEN B=A:N. C
```

The program was created with a text processor and saved.

Normal BASIC programs that have been LISTed to disk may be made to run automatically by appending a GOTO XXX statement at the end of the program without a line number. Remember to substitute a valid line number for the "XXX" in the statement.

```
10 FOR LOOP=1 TO 100
20 SOUND 0,LOOP,10,8
30 NEXT LOOP
40 END
GOTO 10
```

Program chaining without losing any variables can be done this way also. Just have the first program ENTER the second program. The second program must have the GOTO statement appended for execution to continue.

```
(PROG1.LST)
10 DIM A$(18),B$(18)
20 A$="THIS IS A TEST OF "
30 B$="THE SECOND PROGRAM"
40 PRINT A$
50 ENTER "D:PROG2.LST"
(PROG2.LST)
10 REM
20 PRINT B$
30 END
40
50 GOTO 10
```

Note that line numbers without a statement will erase that line when the second program is ENTERed. Several possibilities exist using these methods, so just experiment.

The Basics of BASIC

Rick Burton (RACE)

Last month we did a metric conversion using string variables. This month we'll pick up where we left off and tidy up that last demo by improving the "user interface." It's not very convenient to re-run the program for each conversion so let's add a few lines:

```
4 DIM P$(1)
80 POSITION 12,20
90 ? "PRESS <RETURN>";
100 INPUT P$
110 IF P$<>" " THEN GOTO 10
120 END
```

What have we got now? Line 4: DIM dimensions one character space in memory for the P string. Line 80: Positions printing to screen. Line 90: Prints instruction to screen. (Don't forget the semicolon). Line 110: IF/ THEN computer logic! If P string is not equal to "nothing" then back to line 10. Use the CLEAR and INSERT keys without the SHIFT to type the "not equal" symbol. Line 120: The end!

We can now just press the RETURN key for each conversion.The computer thinks you entered data for string P that is "not equal to nothing" and goes back to line 10. Fine and dandy but the program still crashes when anything but a number is entered for the kilometer value *and* we get an error statement. Let's type:

```
35 TRAP 80
```

The TRAP command traps those errors and drops down to line 80 which then tells the user to press the RETURN key. Now let's add a heading by typing:

```
15 POSITION 12,20
16 ? "METRIC CONVERTER"
```

Our finished product:

```
4 DIM P$(1)
5 POKE 755,0
10 ? "}"
15 POSITION 7,14
16 ? "METRIC CONVERTER"
20 POSITION 10,10
30 ? "ENTER KILOMETERS"
35 TRAP 80
40 INPUT K
50 M=K*0.621
60 POSITION 5,14
70 ? "The Equivalent of ";M;"
Miles"
80 POSITION 12,20
90 ? "PRESS <RETURN>";
100 INPUT P$
110 IF P$<>" " THEN GOTO 10
120 END
```

As you can see, line 50 is the the heart of the program and the rest is user convenience. What's your Atari for if problems can't be quickly solved and tasks easily performed? Stay with us as we further explore the BASICS!

Introducing The New

Diamond Back

Now includes *Diamond Cache!!!*

Listen to what reviewers are saying:

"DIAMOND BACK is a very powerful, flexible program...excellent manual...highly recommended"

David Plotkin - STart

"The overall winner has got to be DIAMOND BACK...it creates GEM compatible disks at image backup speeds...this is the one I use and I use it a lot...It's Dependable!"

LeRoy Valley & Ron Robinson - ST Informer

"If you own a hard drive...then RUN, don't walk, to your nearest Atari dealer and ask him to order Diamond Back!"

Victor T. Albino - ST World

DIAMOND BACK provides a TRUE file backup at image backup speeds with more power and flexibility than all the rest combined! Here are just a few of the features packed into DIAMOND BACK: Easy to use 100% GEM user interface with online help * Backup/Restore ANY number of drive partitions, directory paths, single directories, or specific files in a single pass * Flexible creation of backup sets from different paths or partitions * Wildcard masks to include or exclude files * Incremental backups by date or archive bit (TOS 1.4) * Load/Save custom backup configurations * Automatic drive switching * Full or Partial restore * Flexible disk formatting options * File compression & encryption * Disk usage estimation * Backup to floppies or hard disk partitions * Image backup option * Backup Spectre(tm) partitions * and MUCH MUCH MORE!

DIAMOND BACK was fast, but now it is *F A S T.* Introducing DIAMOND CACHE! The most powerful disk cacheing program available for the Atari ST. Diamond Cache is fully user configurable and even includes a flexible print spooler. Of course, all of Data Innovations Diamond products fully support TOS 1.4 extended partitions.

ALSO AVAILABLE FROM DATA INNOVATIONS

FULL COUNT BASEBALL * COURT SIDE COLLEGE BASKETBALL BASKETBALL, THE PRO GAME * 3 IN 1 COLLEGE & PRO FOOTBALL

If you are a sports lover, these are the games for you! Each game is a statistically based simulation using the actual statistics produced by past and present teams on the field and on the court. Each game comes complete with teams from the most recent season, plus great teams from the past and a stats compiler to keep track of your computer league. If your looking for statistically accurate game play in a sports simulation, these are the games for you!

MYSTERY MANSION

Explore a century-old Victorian Mansion. Find hidden rooms, lost treasure, or maybe the rightful heir to the treasure. Mystery Mansion is an entry level and expert level text adventure! The lower floors allow entry level adventurers to explore, but to leave the mansion you will need luck, and the skill learned on previous levels of the Mansion.

dBMan TipSTer -- Part III

dBase III Compatibility

Peter Killian (O—ACES)

In the first two parts of this series, I talked about some specific commands used by both dBase and dBMan, along with some suggestions to write programs that will work under either system. Some of the commands and routines I covered were:

FIND (do *not* use ampersand as you do in dBase)

Routines to create a database that doesn't already exist, including COPY STRUCTURE EXTENDED, SET ALTERNATE TO, and CREATE FROM

INKEY() and routines to read a key from the keyboard

SET ESCAPE ON/OFF and dBMan debugging keys

Chapter and Verse in the Manual

I should also point out that the dBMan V manual includes two chapters on compatibility with both dBase II and III, although they did not cover the areas I am covering in this series.

Please also refer to these chapters as they give you a list of commands that dBMan either ignores or gives an error when attempted. Like many such chapters or methods of conversion, they are written primarily with the view that the conversion will be one-way and give little attention to going back to the other system (dBase in this case).

This is natural, since they have no control over any modifications the other system may institute and indeed have a vested interest in your using their product rather than their competitors'. Even though this may be natural, it tends to overlook the reality that some people want to freely go back and forth between the two systems and must find out some of the incompatibilities that get in the way.

Procedure File Limits in dBase

One such other incompatibility that drove me nuts for quite a while has to do with limits dBase has which dBMan does not on PROCEDURE files.

It seems that dBase III+ is inexplicably limited to only 32 procedures per PROCEDURE file, while dBMan and the Quicksilver compiler on my MS-DOS machine at work both have no such limitation!

This drove me nuts because I would write and add a routine to my procedure file and it would work with the compiler and dBMan, but not with the original dBase interpreter I was trying to double check it with (dBase would report that the program did not exist.)! I finally found the actual limitation after a lot of digging in the dBase III+ manuals, separated from the other specifications such as file, field, memory variables, and other specification limits.

Report Compatibility

In my earlier columns, I also talked about reports, stating that reports were not created the same way with the two different systems and you could not use reports created with one system under the other. This observation was based on info in the dBMan manual and the fact that the two look quite different when generating reports. Strictly speaking however, the first part is true but the last part (about incompatible report formats or .FRM files) is not completely correct. You can use many reports with either system if you use version 5 of dBMan and do not use some of the special features of that system.

One of the most important functions of any database manager is to get lists, reports, labels, and similar outputs that can be done as reports, and I think I should talk more about these here. I originally thought dBMan and dBase reports would be very incompatible since creating them is quite different. I found out, to my delight, that there is almost as much compatibility as there is in the rest of each system.

Like using the language, there are some things to watch out for. Reports under dBase are flexible enough but dBMan report writing allows some extra features and it seems that as long as you avoid these extra features you can use a report created in one with the other.

Getting used to using dBMan's report writer took quite a bit of effort, however. I had already been using dBase for some time and had gotten used to their method of constructing reports. Specifically, I was used to answering a group of questions up front or having assumed responses for them that could be modified later.

This also held for adding columns, since you create the leftmost column first and add columns from there toward the right side. You could insert or delete columns, but could not move one from one location to another or simply rearrange them. With dBMan, on the other hand, I got a basically blank screen after telling it what database (and index, if any) to use. This blank screen was rather intimidating at first. In fact, I did not use the dBMan report writer at all for a while, preferring instead to use simpler things such as LIST, DISPLAY, BROWSE, SAY, and ? (PRINT) commands or even programmed combinations of them. I can safely say now that this initial intimidation was largely unfounded.

First of all, I found that drop down menus similar to those used in dBase III+ were just a help-key away. Furthermore, I found the blank screen allowed me to place the right-most column first or any inbetween and then move it around if it did not fit in the first location after adding other fields. I could move fields, headers, etc. around almost at will while seeing basically what they would look like in the finished report. I could even test print the report either on the screen or on paper without leaving the report writer—something I have never been able to do with dBase.

I also found that version 5 seemed to do something I don't remember previous versions of dBMan reports doing: it can wrap one column around into the next line if it does not fit in the allotted space for a single line. Under previous versions I remember it always truncating a character expression if it was too long to fit in the space reserved. Now, I can have it either way (wrapped to additional lines or truncated).

After experimenting a little with creating a dBMan report, I took a simple one to an MS-DOS machine with dBase III+ and found it could use it with no problem. I started experimenting with a few other features and soon found that dBase III+ did not like or understand some of the things I was doing with dBMan. All this is true despite the comment in the manual that says the report formats are not compatible and you must first run CNVDB3RW (actually CNV2RW.TTP) to convert dBase III reports for use with dBMan.

Unfortunately, when going from dBase to dBMan, this is true: you *do* have to convert using the conversion program. Notice, however, that there is no conversion program back to dBase, nor is there one needed apparently as dBMan reports seem to normally work under dBase.

Some of the things to avoid when creating your dBMan report for use with dBase include hidden fields, special group headings, functions within headings of any type. A good way I have found to figure out what does and does not work is to create the report under dBMan and try it out under dBase. I have found that generally, despite what the dBMan manual says, a simple report that works under dBMan will work fine under dBase.

As I find other compatibility areas to comment on, I will report them here, but for now I will plan next time to report on some of the special features of dBMan without regard to compatibility with dBase. These special features are what can make dBMan shine.

As always, you can contact me by writing to AIM, O-ACES, or leave E-MAIL on GEnie to P.Killian.

New! Version 1.1 for Command Lines!

Q: What's the Most Versatile Way to Print Your Documents and Text Files?

A: **Use the Presswork's Assistant Version 1.1!**

Stop wasting time loading a wordprocessor or desktop publishing program just to print your files. The Presswork's Assistant loads quickly to give you access to the printing features you need. The intuitive **GEM** interface allows for easy control of margins, headers, page numbers, and other features--all with simple mouse-clicks. You'll never have to touch the keyboard again! Ideal for ".DOC", ".TXT", and "README" files, or most any quick printing job. Online **HELP** is always just a mouse-click away (GEM mode only). And now there's even a command line version for shell users--perfect for programmers and MicroEMACS users. The Presswork's Assistant version 1.1 is available now for just $10.00 (US).

The Presswork's Assistant
Available only from:

ENHANCE GEM

TUI the Textual User Interface

Control your computer using typed commands:
Type one command to execute many with batch files.
Manipulate many files with one command using wildcards.
Send output to screen, printer, a file, or even a program.
Link programs together to perform complex tasks (utility programs included).
It's a desk accessory, giving you an immediate choice: graphical (GEM) or textual (TUI).
Leave its window open and interact with other windows.

PROTECT YOUR DATA

STASH Hard disk backup/restore system

Easy to use, fast, reliable, GEM-based.
Backup all files or only the changed ones.
Automatically formats floppies if needed. • Audible prompting.
Backup files larger than a single floppy.
User-configurable default settings + unlimited number of other configuration files.
Includes utility programs.

IS THERE A TACTICIAN IN YOU?
PART 8

Tim Feenstra (GRASS)

By December 1944, the Nazi empire was in danger of collapse. Allied armies approached from both east and west.

With a sizable military force still under their command, the high command gathered a large Panzer army together and positioned them in the remote Ardennes Forest, an area where both sides sent tired units to rest and green units with no combat experience.

As the deployment neared completion, they watched the weather, looking for a heavy overcast front to work its way into the area. On December 15, the weather forcasters predicted several days of overcast.

Early on the 16th, a massive artillery bombardment began what has become known as the Battle of the Bulge.

Breakthrough in the Ardennes

Breakthrough in the Ardennes is a simulation of the first two weeks of Hitler's last offensive move in the west. A single player commands the German forces from a regimental perspective.

Each turn is one day of the battle, the game has both a day and night phase, with air operation during the day if the weather permits. Your forces are Panzer divisions, Panzergrenadier divisions, and some Panzer brigades.

These divisions may be divided into their component regiments to cover a larger area, or combined into a single unit for a very strong unit. You get a bonus value added to the unit if it is in division form.

Movement orders are given directly, with the unit moving in the desired direction until it has used all its operation points, or until it comes to a hex with an enemy unit.

When directed to enter an enemy hex, the unit is plotted to have combat during the next combat phase. Supply is handled by the computer, which will check each unit to make sure it is not cut off or out of supply. Air operations may be used to supply advance units that get a little ahead and outrun the supply train but at a lower level than ground supply, and only in acceptable weather.

Your forces are divided into corps which have a corps artillery pool. This pool is used to allocate heavy artillery to units in that corp, but there is seldom enough to go around, and you still face the biggest problem the Germans had, fuel. After the third day there is a 12% chance that any mobile unit might run out of fuel.

One more headache is the American efforts to blow up all the bridges in your path. Only engineer units may rebuild a bridge, and they will not do so if an enemy unit exerts a zone of control over the bridge hex. A zone of control is all the hexs next to a unit, giving the effect that large units had on large areas of the battlefield.

Each turn you have a limited number of replacement points to allocate to your weakest units, or those you want to build up for another attack, but these points do not accumulate. You must use them every turn or lose them.

The air operations consist of selecting targets and assigning a number of bombers from the bomber pool to that objective, and assigning a number of fighters as escort. Unused fighters fly interdiction missions to intercept enemy aircraft.

This game is very playable, and is one of my favorite large scale land-based games. Though it is easy to advance far into the enemy rear, it is difficult, at best, to keep supply and reinforcement lines open and to block the counterstrikes by American units left behind by your spearhead.

The objective is to exit your units off the west edge of the map, putting them on their way to the English Channel and the isolation of several Allied Corps. If you play a lot, you can usually play this game in about a week, or even a weekend if you don't get much sleep.

War In Russia

War in Russia is probably the largest game available for the Atari, and the most involved. You are responsible for the production of factories, (ie., type of production), the formation of new corps, and the overall strategic planning of the entire Russian front, from the invasion in 1941 to the conclusion in 1945.

Turns are one week game time, and your units are corps of up to six divisions each. Movements are strategic, tactical, rail and naval if you control both ports involved in the movement.

I am not going to do an in depth here, it would reqire perhaps an article of its own. I just wanted those who have started playing these to know about this one. It is the ultimate challenge to someone who has already discoverd the tactics of large scale warfare, and who wants to experience the entire Russian war.

It may also be played by two people, but it takes months to complete this one, and that is a large investment of time for two to get together. It is possible to play by mail, where the game is saved after each player takes his turn, sends it to the opponent, who then takes his turn and so on, but this takes an incredible amount of time to complete a game that has over 200 turns.

Desert Warfare

Not long ago I got involved in a series of battles in the Mideast Arab/Israeli War in 1973. I was losing interest in it (having won five of seven battles) when there started a new skirmish in the Mideast. Quickly I worked out which games might allow me to see just how a battle might go before there is one.

The first is Combat Leader, a realtime constructon set that lets you command up to three armor and two mech platoons. Armor, speed, and fire accuracy may be set for the tanks, and the manual gives the data for tanks from several countries from WWII to the present. The map data input has enough information that a realistic map of the flat, featureless terrain can be created. A maximum of 15 tanks per side would be a very small part of a major battle, but the outcome should prove fairly accurate if you get the data setting correct.

The second possibility is Battalion Commander. This is a larger version of the previous game, but only has one type of tank for each of three countries. With M60A1 and Soviet T62 tanks, the battle would be more like Iraq pitting itself against one of its neighbors without US intervention. The game has 40 built-in maps, of which a few have the proper terrain of the Mideast desert. The advantage to this game is that you can have up to 4 full companies, a complete battalion, under your command.

Mech Brigade

The first two games are OK, but the best one I found is Mech Brigade. With this one, you can set up each side with the proper AFVs (armored fighting vehicles) to simulate the battles with or without direct US support. The terrain features are primarily from Europe, but with a little effort, and not many trees, a good map can be made. The good guys can use either the M48 or the M60 tanks, or even the M1 if you want to command a US force.

The bad guys can be given T55 and T62 Soviet tanks, which match up well with the M60 and M48, but don't hold up well under the assault of M1 Abrahms. You can also add mech platoons to round out the force. About the only thing lacking is the air cover that is available there now, but the game has no provision for air operations beyond the use of helicopters.

Of course you should use some helicopters; the US will if there should be a battle in the sand out there. Just be sure to give your opponent some anti-aircraft capability (it would only be fair) that includes old Soviet SAM type missiles. With a little imagination, some Apache helicopters could represent A-10's, those little tank hunters being deployed in Saudi Arabia right now.

One Final Warning

Well, I am off to the mideast, I have enjoyed doing these articles and hope some of you try a few wargames before you say they are too hard or not much fun. I will warn you now though, they can become very addicting, just ask my wife. I would be interested in hearing from those who find they enjoy war gaming. Perhaps we can exchange tactics, hints and stories.

Farewell, and good hunting.

Steve Volker (STAG)

Gather 'round children and listen to a tale of wonder and amazement. Of hearts full of courage and resolve, and a world full of the abstract and the malevolent...of the world of LOOM.

In the mid-1970's, the first adventure game was written on a large mainframe by Willie Crowther and Don Woods (In FORTRAN). Though devoid of color, sound or graphics of any kind, it took us easily into the depths of a Colossal Cave and made us believe we were there!

You smelled the dankness, heard the echo and felt the *fear* as the excitement of the moment dragged you ever deeper into the bowels of this first rate story.

Well, our computers have come a long way since then; massive memory, the addition of dazzling graphics and melodical sounds. (Oh! How I love it!!) Why, sometimes we find ourselves literally hypnotized by a visual Tsunami of color and activity and action! In all this, something was missing. Something Loom has. A story.

Though it becomes obvious almost immediately that Loom was meant for the young, (you are helped through most of it, and the general rhythm of the storyline is idealistic and limited), the underlying richness of the tale is sweeping and alluring to all ages.

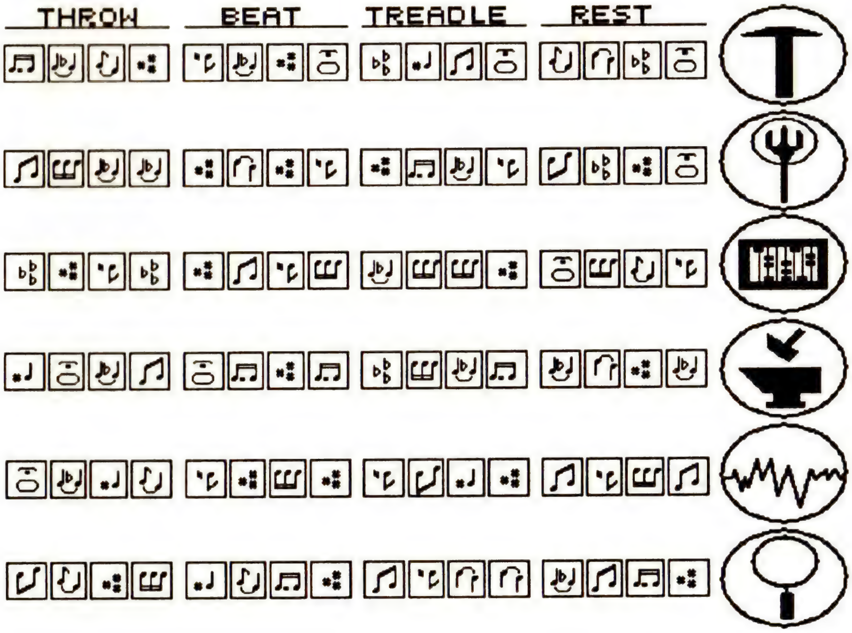
In the box we find three double-sided disks (chock-full), a Dolby stereo cassette tape with an audio-drama to help you get in the mood, one red gel (used for reading the musical symbols to bypass the copy protection), a reference card, game manual and a most amazing book of spells called the Book of Patterns. The whole thing is really quite exciting and has a number of unique and fun characteristics, such as:

- no matter how 'inexperienced' you are, the programhelps you through each scene or puzzle
- you can explore impulsively, even recklessly with no real fear, the program doesn't LET YOU DIE!!
- the way to solve each dilemma is through thought, logic, and attention to detail, not brute strength or interminable hacking and slashing
- the procedure for 'casting' spells is ingenious, fun and almost believable!
- the game contains a truly terrifying nemesis
- and, in spite of all this, you still feel the tension of a life and death struggle to save your new world

Here's the game you want to go through *with* your children!

Brought together by LucasFilms, distributed by Electronic Arts, and woven expertly by the imaginations of Brian Moriarty, Loom is a visual novelette of unsurpassed beauty. And like a great book, you feel the need the pick it up and 'read' it over and over again.

(Author's Note: Brian. If you're reading this,..I've seen the 'movie', now write the book!!)



The Game of Harmony From Accolade

Tim Holt (El Paso)

Have you checked your crystal lately? Have you chanted your mantra? Is your Ying out of synch with your Yang?

Well, I have a game for you! Billed as the first "New Age Game," Accolade has come out with The Game of Harmony, a game to relax you, rather than raise your blood pressure. Actually, the idea is pretty neat. I personally am growing tired of "shoot-em until the entire population is destroyed" games. There are far too few games where the objective is not to kill and destroy. Harmony is a step in the right direction.

The idea of Harmony is very basic: push similar colored orbs together, cancelling each other out, and when all the orbs of a screen are eliminated, move on to the next level. The manual calls this synergy. Sounds easy, but like any good game, a simple idea can sometimes get complicated.

If two unlike colored orbs hit, they make an altogether different colored pod. You can grab the pod and get more energy. But if you let them lie too long, then you have to cancel them out by pushing them against a similarly colored orb.

Still with me? It gets more complicated. There are barriers of all different configurations (fifty in all) that prevent you from moving forward. Also, spheres can be "rubber banded" together, so where you push one sphere affects the one that is attached to it. If you push them together in such a way that they keep hitting each other over and over, well, they create more pods, more spheres, and on and on.

How Hard Can It Be?

Okay, so what? Well, you have to get out of a screen before the spheres explode with tension. The more spheres you get on screen, the less time you have to cancel out each color. It can really get out of hand if you have 20 or 30 orbs all getting ready to explode. When the explosion happens, you lose a life. You have 4 per game.

Okay, how do you push all these spheres together, how do you collect the energy pods? Well, you control a sphere of your own (called a "seeker") that can be controlled by the joystick or keyboard. It will go in the direction you tell it, and the direction is pointed out on top of the seeker. Be careful though, you only have between 10 and 30 seconds per level.

You can move on to bonus rounds, where you acquire more time, more lives or more energy. There is even a random pod that pops up and if you run it over, you get a new life. Sort of a reincarnation if you will.

Getting Down to Specifics

The manual is very brief, as it has the loading instruction for all versions of the game and takes six of the thirteen pages to tell you how to start. The instructions are brief and hold to the theme of "New Age"; you are reminded to relax and not to breed tension. You could easily figure out the game from the onscreen instructions appearing in the demo mode.

There are three modes: demo, mantra and normal. Demo is self explanitory, but as I said, does have good instructions.

Mantra mode is known in most worlds as practice. No scoring, you can't be eliminated, the spheres do not explode with tension and you can go through all fifty levels if you wish.

However, don't expect to play the normal mode as you did the practice mode. In practice, the pods do not appear as in regular mode, and there is no time limit.

The game is not copy protected, and *may* be placed on a hard drive. This is a nice touch. However, you must get through the copy protection scheme and match a screen picture with a list of pictures on a separate piece of paper.

An interesting note: The paper for the copy protection screens is a very dark red color and cannot be duplicated with a photo copier. This is a very smart move by Accolade. However, it is so dark the actual screens on the paper are most difficult to discern. I guess they knew that would happen, because they give you three chances to enter the correct screen number.

Do I like Harmony? Yes. It isn't the greatest game I have ever played, but it is very pleasant to play. It is, as it claims, relaxing to play.

The sound is very nice, and comes out really loud and clear when you have it hooked up to speakers on your STe. The colors used are all pastels, not seen too often in games. Very pleasant to look at.

Sick and tired of killing games? Then check out The Game of Harmony. After a hard day at work, you deserve it.

Batter's UP!

Irwin Brooks (LACE)

Ladies and Gentlemen, it's the bottom of the ninth inning with two outs when the Atari TT steps up to the plate with the bases loaded.

On 3rd base we have the Atari 8bit, the ST is on 2nd and the rookie Lynx is on 1st. The scoreboard shows the grim situation in this David and Goliath game of computer survival. The opposing IBM team has scored five runs in the last eight innings with the Atari team scoring their only run in the very first inning.

It looks like the Atari lineup is faced with impossible odds at this late point in the game. However, scouting rumors bring us tales of the power and speed of this newest Atari team member, TT.

For more than a year now, we have learned tidbits of information on the flexibility, versatility, speed and outright brute strength of this newest champion of the Atari lineup. Doubts were squelched when a muscle flexing sneak preview was done. What remains to be seen though, is the ability of TT to square off against the aggressive opposition to rally the Atari team and give them a fighting chance.

I have to admit, morale is at an all time low in the Atari bullpen. The squabbling and infighting have really taken its toll. Managers, coaches and team members have been fired almost before being played. Even now, the cheerleaders are dozing on the benches and the Atari fans are leaving early, counting this game as another in a long list of defeats.

But wait, all eyes are watching TT move into batting position. All activity in and around the stadium ceases. There is a long pause followed by a loud sigh when the first pitch is thrown. It looks like a curve ball going for the inside corner. The crowd holds their breath and TT pulls back the bat and narrowly misses the ball. *"Strike!"* yells the umpire.

It looks like the catcher is talking to TT, trying to stir him up. The pitcher winds into the pitch and releases what looks like a low slider. Again, the eyes of the crowd follow the ball down the alley. With a flex of his muscles and a move of his foot, TT swings the bat for another strike.

The Atari coach, Sam Tramiel has called a Time Out and is now walking toward TT. Folks, let's take this moment and talk about some of the things that have been troubling the Atari team.

The Atari team is the first team in history that has tried to make the transition from the minor to the major leagues. The Atari team is not a newcomer to baseball, dating back to the late seventies.

However, their biggest problem seems to be rooted in the fact that they are still playing by minor league rules. What used to work there is child's play in the majors.

Atari team spirit is a big fat *zero.* Heck, new members don't stay long enough to get acquanted let alone become a team player. With a turnover like that, it's no wonder words like team- work, cooperation and planning are foreign.

One of the rumors that keeps cropping up is the inevitable withdrawal of the Atari team from the majors. An Atari loss of this game certainly could validate this rumor.

It seems the fate of the Atari team is resting squarely on the shoulders of TT. However, even if he is successful in hitting a grand slam, the score will still be only a tie. Victory will still be a run away. Although somewhat unlikely, it will send the game into extra innings, where the deciding points can be gained or lost.

Back to the game, where the coach is now leaving TT. It looks like he fired up ol' TT. The umpire has resumed the game. The fans, myself included, have crossed our fingers for this next pitch.

The long pause is broken by the sly smirk on the pitcher's face. The wind up is released into a fast, dead-on pitch headed straight down the alley.

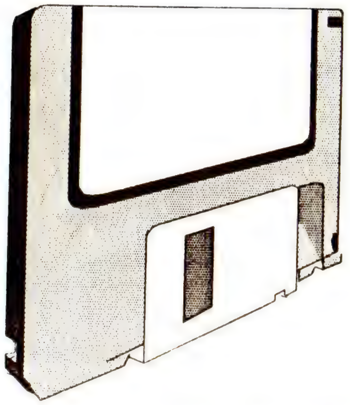
TT eyes the ball with unflinching determination and swings at precisely the right instant to send the ball shooting out toward center field. The ball continues its climb, sending the center-fielder back toward the fence. It starts its descent while the center-fielder starts climbing the twelve-foot fence for a possible intercept.

My guess is it will be a close one, with the ball definitely headed over the fence. It looks like it will be close enough that the center-fielder could reach it from the top of the fence.

So, ladies and gentlemen, it looks like a race to the top of the fence. A lot rides on the outcome of this play.

Will it be intercepted or a game-saving GRAND SLAM?

Stay tuned to your local Atari information source to find out the outcome of this exhilarating game.



AIM Disk of the Month November 1990

All files on AIM Disks of the Month are self-extracting LZH archives. To use these programs, simply copy the files onto a disk with plenty of free space and double click the files. The files automatically unARC themselves into the runnable programs.

Here's a short description of the files found on the November '90 disk. For more complete documentation, see the text files contained within most of these archives.

ARCLZH23.TOS—Allows conversion of ARC <-> LZH files. Version 2.3 adds an error log reporting and backwards formatting. You can now format a disk backwards and abort if you change your mind. This will keep you from destroying the disk's FAT & Directory tables. Also added is the ability to convert a single file.

CHEATS2.TOS—Cheats for 53 ST games. These cheats were not verified by the author, so they may or may not work. If you're stuck in a game, these just may help you out.

CHEATS.TOS—Various cheats for 49 ST games. Cheats range from level codes to unlimited lives, energy, extra weapons and level skips.

COWS_70.TOS—Cows v7.0 is a text adventure game that should run with virtually any BBS software that allows doors programs. Can also be run from the desktop. Cows contains graphic violence (a graphic violence text adventure?) and borderline adult language, so it may not be for all. However, if you're not easily offended, chances are you'll LOVE this game. It has GREAT humor throughout..."Nothing fancy, but then cows are stupid anyway."

DTERM99F.TOS—This short term program, has Xmodem, Ymodem, Ymodem-G and Zmodem protocols. Other features include 5 editable macros, and a resizable capture buffer.

EDHACK2.TOS—Version 2.0 of what used to be called DIARY, the text editor written by Craig Harvey, President of the Washtenaw Atari Users Group. It takes 77K of RAM minimum when run as an ACC, but lets you edit files up to 99 megs in size on a 512K machine! Runs in low, med, and high resolution as an ACC or PRG. Shareware.

ENCH_FOR.TOS—This game is a variant of 'Shutes and Ladders' and 'Candyland'. It's suitable for children 3 and above. The game options are configurable to make it easier for younger children. Shareware. Color ONLY.

FASTGIF.TOS— Fast GIF allows you to view/convert GIF pictures. It converts to DEGAS .PI1 files. Fast GIF is better and faster than any other GIF viewer. This program is shareware...and well worth it!

GRAB_BAG.TOS—Three little programs... DRIVE.PRG sits in your AUTO folder and checks for viruses when you boot your computer. DRIVE2.TOS lets you check piles of disks for viruses as fast as you can cram them in. SCREEN_D.PRG is a screen to disk dumper. The C source code for all three programs is included.

HDFREE.TOS—HDFree Pro v2.0 displays useful information about your hard drive partitions, including Used Space, Free Space, Total Space, File Count and Folder Count, Percent Free/Used. You can display info in bytes or megabytes! GEM Based.

IGCLIP15.TOS—A DEGAS to Instant Graphics! converter. Allows online viewing of DEGAS pics or portions thereof to be viewed online with the Instant Graphics! setup (supplied on the Oct. '90 AIM disk).

KALEN.TOS—Dual language English/ German program which calculates weekday of a given date, holidays within a given year and tells about their significance, calculates Julian days, dates of Easter, number of days between given dates and more.

KV_MATCH.TOS—Flip over squares to match baby and parent animals. Names of animals are spelled in upper and lower case. Each match found helps complete the picture. Color ONLY.

LEONARD6.TOS—Leonard6 (named after the movie "Leonard - Part VI") is a replacement for the system bomb handler. Install it in your system and instead of bombs appearing after a crash, little heads with ones and zeros will appear. Works in any resolution and on the TT.

LTRHUNT.TOS—This matching game will help young children learn the alphabet. There are three levels of difficulty. Color (low rez) ONLY.

MOUSE_DB.TOS—Mouse Doubler 3.0. Scales up your mouse movements, to make it easier to move the mouse pointer around the screen. Has 5 modes: Doubling, Tripling, Quadrupling, and two levels of exponential acceleration.

NEVER750.TOS—Mount Neverest v7.50 online multi-player game. Put this game on your BBS (Forem, Express, anything) and people play it against other people. Players climb a mountain, cast spells and try to get to the top first and become powerful. Once at the top, you have to try and stay there, because there are new players who try and get you. Crash-Safe coded. U.S. edited trivia file included. Time limits enforced within game.

OUTERLMT.TOS—Fast, action-packed arcade game written in GFA Basic 2.0. Shoot the alien ships and defend against meteorite storms. Written by Rich Betson, President of the San Diego Atari Computer Enthusiasts.

REORGTUT.TOS—Program accompanying Robert Arp's article on hard drive fragmentation and reorganization, this tutorial graphically shows how file fragmentation slows down a drive and how defragmentation works.

SUPRPOLY.TOS—The best "psychedelic emulator" yet! Yes, it has swirling, shifting colors and gliding, changing shapes! Lets you set parameters "on the fly" and select from 5 inherent cyclical animation palettes or loadable, savable user-defined palettes (84 colors!) Color ONLY.

TLC_ATTR.TOS—Change any file's attributes. Change a file to 'Hidden' status, a 'Read Only' status, a 'System File' (won't be shown on desktop), etc. Even change the date and time when the file was created. Runs as an ACC or a PRG.

TLCPLAY.TOS—Play any sound format file. You can amplify, soften, stretch, or squeeze a sound. There are three save options: Digisound format, SoundOff! (ST-Replay) or raw data file. Excellent manipulation tool. Written by Tom Hayslett from Germany.

YMG125.TOS—This is the fastest transfer protocol currently available for the ST. For use with error-correcting modems or null-modem setups.

ZMODEM14.TOS—Version 1.4 of two Zmodem programs for up- and download. They report the file name, up/download time, etc. in a GEM dialog box. You can use them from the desktop or from other programs (like Flash), or even from command shells.

Readers can purchase the November '90 Disk of the Month from their local AIM Participating users group or by sending $6 ($5+$1 shipping/handling) to Unicorn Publications, 3486 Braeburn Circle, Ann Arbor, MI 48108. Please specify the November '90 disk when ordering.

** ** **Introducing the GOOD Backup Utility** ** **

GOOD
Backup
Utility

Specially designed for keeping complete backups of your hard disk partitions. Backup disks are TOS compatible.

Intelligent Updates!

Update your backup every day! Only new & modified files are copied, and the old files are deleted to make room. As good as an image - but done in less time.

Great for use with Cartridge Disk Drives

All this for only:
$29.95
Suggested Retail Price,
(in massachusetts add sales tax)

Tid bit

Tidbit Software Engineering Company
25 Wood Lane, Maynard MA 01754
Telephone (508) 897-7429

Features of the GOOD Backup Utility:

- Copies data from a selected active disk partition to a pile of ordinary TOS readable backup disks.
- A backup can be interrupted before it is done, to be completed later.
- You can keep your backup saveset on floppy disks, removable cartridge drives, or keep a shadow partition on another hard disk unit.
- No folder limit on backup or restore.
- Any file that cannot be fit on a single saveset disk will be split up across as many as needed.
- Updates to the backup will only copy the files that have actually changed. If you update your backup frequently, the update goes very quickly.
- The GOOD Backup Utility can format floppy disks for you as additional disks are needed.
- Lost or damaged disks in the backup saveset can be replaced without replacing the entire backup saveset.
- Checksums are used to verify that the files on the active disk drive and on the backup disks are all intact.
- Write back disk cache technology is used to make all the copying go fast.
- Backup can be by partition, or select specific files by including or excluding a set of wildcard file specifications.
- Files can be restored as an entire partition, or by wildcard selection. When restoring an entire partition, only files that are actually missing need to be restored.
- A reference list can be produced for locating individual files within the backup saveset.

Pressing the HELP key will provide additional information at every step.

If your dealer doesn't have the GOOD Backup Utility, you can order it from the Computer Bug, 113 Russel St., Hadley, MA, 01035 (413) 584-7722

SOFTWARE PIRACY hurts BIG companies.

But it *KILLS* small companies.

Have you ever heard this rationalization for stealing? "Big software companies aren't hurt by one or two pirate copies of their programs."

Well, the truth is that many of the best Atari software houses are NOT big companies –– they're small businesses with few employees. Many of the best programmers and developers are Atari enthusiasts like you. And the loss of just a few sales due to software theft can help drive them out of this comparatively small market.

The next time you're tempted to give or receive a copy of a commercial program, consider how piracy affects Atari software developers and the future of Atari computers.

The Atari Boosters League East (ABLE) meets monthly with enthusiasts and provides user support for all Atari computers except the Portfolio and PC line. The purpose of ABLE is to advance the knowledge of the membership through mutual education and the interchange of ideas.

General meetings are held in the Palm Magnolia Room at the Orlando Public Library, 101 East Central Blvd., on the last Sunday of each month from 1:30 to 4:30 P.M. ST SIG special interest meetings take place in Room 134 at the Bush Science Center on the Rollins College campus on the second Wednesday of each month from 7 to 9:30 P.M. Ad hoc meetings are scheduled as needed to present speakers, conduct special workshops, provide tutorial seminars and for parties. We assist members in service and software problems, as well as arrange group purchases and discounts.

Information is disseminated to members through our newsletter, the ABLE Atari Information Digest (ABLE AID). A package of twelve selected previous issues of ABLE AID higlighting the "super eight" computers is available for $10 ($5 for members). In 1990, ABLE began participating in the Atari Interface Magazine.

We have also established an ABLE Program Library of User Software (ABLE PLUS), consisting of several thousand files for the super eight and sweet sixteen computers. This library contains public domain programs contributed by ABLE members, as well as other computer clubs and users, to allow the sharing of user-written software. A computer specific listing is available to non-members for $3 and disks are available to non-members for $6 each.

ABLE accepts written correspondence at P.O. Box 1172, Winter Park, FL 32790, while membership inquiries are handled by Hadley Nelson, President, (407) 671-0317 or Milton Eager, Treasurer, (407) 834-0581. Annual dues are $12.

FOR SALE

$5 each: Knight Force, StarRay, Lancelot, Time Bandits, Trailblazer, Borrowed Time, Gold of the Realm, Titan, Regent Word II, DBASIC w/ Manual, Beat Box and Magical Math I.
VDOS ProQue—$15
DVT VCR Hard Drive Back Up—$50

STarfleet Meeting Minutes by Thomas Oughton September 14, 1990

Officers present: Guenther, Robique, Oughton

The meeting started with a total of seven members present. Anyone who wants to attend our meeting, we meet at the Denny's at about 79th Avenue on north Wadsworth in Arvada, Colorado.

We started with a discussion of printer triva. If you own an 800XL, 65XE, 130XE, or XEGS two or more printers can be simultaneously connected to your system. Just like two or more disk drives can be attached to the system and addressed by D1:, D2:, D3: etc. The printers can be addressed by P2:, P3: etc. As the printers don't have switches, like the disk drives, each type of printer or interface has it's own number.

Printer/interface	Number
850	P2:
1025	P3:
1020	P4:
1027	P5:
1029	P6:

Of course, each printer interface will still respond to P: or P1:. If There is a need to use a printer and a plotter in one program, this is one way to do it.

Next we talked about the Atari Clubs of Denver's Bulletin board. Mike bought a 256K MIO to attach to our 130XE. We then voted on the purchase of a hard disk and controller to attach to the MIO. It was decided that all member clubs will pay part of the cost of running the board.

Next was the demonstration of Fooblitsky, even though it is no longer being made, some stores still have copies. In this game 1 to 4 players play and each player is a dog in the city of Foobltsky. The object is to find four objects before the other players find them. The items are found in different stores located around town. There are four locations for each store, this allows all players a chance to get all the items. There are several things that are placed to hinder the players quest. Amoung these are cars on the streets, and the "chance man." This game is good fun for a family that wants to play together and dislikes shooting aliens.

We next demonstrated The Halley Project. This game is very accurate in the placement and size of the planets in our solar system. It does not include some of the moons found by Voyager and no planets include rings. The mission is to fly from Halley's comet to a named planet. This is very educational as you must know things like Charon is the moon of Pluto, and where pluto is in the solar system. The major problems with this game is once completed, there is no reason to play it again. The second problem is that the ship will not automaticly orbit any of the planets. This makes landing really tricky. This game is still available from Thunder Mountain software.

The Meeting broke up at 9:45.

A.C.C.T.

Atari Computer Club of Toledo club members receive, as part of their dues, Atari Interface Magazine and access to the 8-bit and ST public domain software libraries. Disks are $2/8-bit and $3/ST, non-members may purchase disks at a slightly higher cost.

A.C.C.T. meets on the second Monday of the month from 7-9 pm at Bassett's Health Foods, 3301 West Central Avenue (Westgate Shopping Center), Toledo, Ohio. 8-BIT SIG (yes, I said 8-bit) held monthly at the home of Jim Herzberg. Dates and times announced at meeting. ST SIG held monthly at the home of David & Brenda Micka. Dates and times announced at meeting.

A.C.C.T. may be contacted at 6107 Greenwycke Lane, Monroe, MI 48161, by calling Dave Micka at 313-241-1157 or Michael Justice at 419-242-7797 or via Fantasy Island BBS.

President:	David Micka	313-241-1157

ST Librarian:	Brenda Micka	313-241-1157
Fantasy Island BBS (3/12/2400)		419-691-6459

Many topics came up for discussion at the September meeting. If any member has an opinion or wishes to vote on the following motions, come to the November meeting.

It's been suggested to make all memberships come due the same month. Right now it's up in the air which month. It's likely to be May or October. Some members think a different meeting day (such as Wednesday) would bring more members to the meeting. Some feel on Monday most people have too much to do.

WE NEED PEOPLE to work the Computer Fest In November. Volunteer your time or your system or part of your system or All of the above. If you can't come to the meeting to Volunteer. Call Dave and tell him what you can do and bring. Bring an Idea if nothing else.

Kevin Rutherford reported Genie has gone to a flat $4.95 a month for certain sections, such as the message bases. Other sections are a flat $6.00 an hour for 1200 and 2400 bauds.

That's all for this month. If this get's in before our October meeting, Remember October is Election month. Be there! You might get elected for something if you're not!

ACORN

Atari Computer Owners of Rochester New York

The Atari Computer Owners of Rochester, NY (ACORN) meets on the 2nd Wednesday of each month. For the months of August and September, the group will meet at Sunset Recreation, 1317 Chili Avenue, in the town of Chili. (For all you out-of-towners reading this, that is pronounced Chi-lie). A vote is being held to determine a permanent meeting place.

At the August 8th and September 12th meetings, we will have our normally scheduled STarter class for the ST which meets at 6:45 pm, and a Basically Speaking class for the 8-bit which starts at 7pm.

ACORN operates a BBS at (716)436-3078 with 40 megs of public domain downloads for the 8-bit and ST systems. Our mailing address is POB 23676, Rochester, NY 14692.

Dues are $18 per year which includes access to the club's PD libraries, enhanced access to our BBS, and subscriptions to our newsletter, the ACORN Kernel and to Atari Interface Magazine.

President	Don Allis	(716) 293-3415
Executive VP	Albert Yarusso	(716) 244-4487
8-BIT VP	Nick Cup	(716) 266-1648
ST co-VP	Dick Orme	(716) 334-4093
ST co-VP	Robert Costello	(716) 244-4487
Secretary	Chris Freemesser	(716) 328-1703
Treasurer	Vinnie Indovina	(716) 594-9731
Basically Speaking	Jeff Summers	(716) 342-7632
STarter ST Class	Stu Woodard	(716) 352-4937
ACORN Editors	Candi & Bruce Nelson	(716) 334-5513
8-Bit Librarian	Nick Cup	(716) 266-1468
ST Librarian	Joe DePierro	(716) 223-7838
Ex. Newsletters	Helen Kiker	(716) 924-4809

October Hi-Lites

At our September meeting, Sysop Chris Freemesser set up our BBS on the club's ST, and hooked up another system to demonstrate how the BBS worked at both ends.

Written ballots were collected for the vote between permanent meeting places - Brighton High School, Sunset Recreation, or Rochester Institute of Technology. As of this writing, the final vote had not been determined.

We have recently upgraded the equipment on our BBS, and all Atari users are welcome to call. The number is (716) 436-3078 at 3/12/2400 bps.

ATARI FEDERATION

Regular meetings are held at the VAFB Federal Credit Union, Vandenberg Village, Califorina on the first Monday of every month at 7:00 P.M. Dues are $10 for individual or $15 for family membership. The Atari Federation maintains a PD software library for both 8-bit and ST computers.

President	Phil Rominger
Vice President	Bob Ribortone
Secretary	Matt Matias
Treasurer	Herb Kanner
Newsletter Editor	Jerry Sullivan

Atari Federation Meeting -- Sep 10, 1990

This month's turn out was pretty slim, only 10 members showed. Of course that is typical of a holiday month. Bob Ribortone briefed the changes at GEnie. Both the good and bad points, overall it was agreed that the changes were for the good. However, there is a minimum monthly charge now of $4.95.

Phil Rominger briefed some Atari news: The Glendale Show is next week. Calamus and Universal Item Selector III are not compatible. And there is a new 80286 emulator out for the ST. (I saw it at the Glendale show, it's called the AT-Speed.)

Doug Hadland talked about his new HP Deskjet. He is very happy with its performance. To prove how well it works, he brought in several sample prints, very impressive. (I use an HP Laserjet II at work, and the Deskjet looked just as good!)

This is an offer to Clubs with MIDI Sigs

M & D Enterprises... (Micheal & Donna Calvin) would like to offer free of charge (except for postage) our 2 Demo Disks of Sequences in MIDI Standard Format. This is a single disk ARC package. Included are the Pagestream files to create the labels.

This is a one-time, limited offer and expires December 1st, 1990. If you are interested send a SASE (business size with 85 cents postage *please!*) with your club and either your Librarian's name or your President's name to us at:

M & D Enterprises
7700 N.E. 120th Ave
Vancouver, WA 98682-4129

We will send the disk package along with catalogues of the sequences presently available.

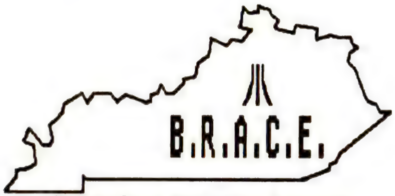
Birmingham Atari Computer Enthusiasts

The Birmingham Atari Computer Enthusiasts of Birmingham, Alabama meets at the Vestavia Hills Library downstairs at 7:00 p.m. the second Monday of each month. Membership dues are $20 for a regular membership,and $35 for a professional level membership.

Mark Bodenhausen	President
James Gilreath	Vice President
Brenda Bodenhausen	Secretary
Steve Yates	Treasurer

For membership information, contact Steve Yates, 1005 Candy Mountain Road, Birmingham, Alabama 35216.

Our BBS is at (205) 833-5012. This is both a voice and data line. To access the BBS, press 1 after the first ring. For voice, press 2. After 6 rings, 2 is automatically selected.



Bluegrass Region Atari Computer Enthusiasts

President	Hal Nason	(606) 269-8989
Vice President	Greg Parsons	
Secretary	Chris Dotson	
Treasurer	Vacant	
Librarian	Chris Dotson	
BBS Sysop	Rick Bradfield	

B.R.A.C.E. (Bluegrass Region Atari Computer Enthusiasts) meets the third Sunday of each month from 1 - 4 PM. The site of the meeting is undetermined at this time. The officers will be in contact with you in the future to advise you of the meeting site. Current membership dues are $15 per year for an individual membership, $20 per year for a family membership and $10 per year for an associate membership. (An associate membership includes receiving the monthly newsletter, but excludes the use of the library.) Members of B.R.A.C.E. have extra downloading privileges on The Abyss BBS (606) 223-2782.

BRAG ST

Buffalo Region Atari Group for ST's

BRAG ST was founded in 1987 to serve Atari ST owners in the Western New York area. General Membership Meetings are held on the third Thursday of the month at Erie Community College North Campus, Room S-105 in the Student Center. Setup begins at 7:00 PM; Meeting starts 7:30 PM. The Board of Directors meet on the the first Tuesday of the month at the Your Host Restaurant, Harlem at Sheridan at 7:30 PM. All are welcome to attend. Piracy will not be tolerated at any BRAG ST function.

BRAG ST, PO Box 1035, Buffalo, New York, 14225

Chairman	Mark Pierro	(716) 691-7844

As there was no August meeting, there's not much to report this month. However, it's time to think about elections. We need to fill the postions -- nominations will be in October and elections will be held during our November meeting. Consider giving the club some of your time -- run for office today! By the time you read this, the revised PD library should be available, both at our regular meetings and through the mail. More details in the next BOAST Quarterly.

Central Connecticut Computer Club

Hi dere... Notice that all this text is going to be referenced to as future. Such as, Joe Mirando WILL be bringing a 520STe and his 1040 with P.C. Ditto II installed to the September meeting this month.

This is to be the first official meeting of CCCC held out of Eastern Computer Video. All members are being notified of the change, although I really don't think that anyone will show up at Joe's store anyhow! It appears that to survive as a club, new blood is needed. Does anyone know of a store left in Connecticut still selling Atari so that we might be able to beg a customer list off of them?? I know that they are out there....

Atari owners, that is...got to be a few of them still around that could benefit from a users group. Appears that all our previous members know everything there is to know about Atari and have moved on to other challenges, such as Unix and Messy-Dos. Whatever. CCCC will remain until buried. I guess that means we will be here till I decide to quit.

Reminder to all those still breathing—Boston Computer Society has a meet at the U-MASS Boston Harbor campus on Saturday, October 27th from 9am to 4pm. Good 'ol Bob Brodie will be in attendance along will most of the East coast developers.

Sour Note—Why is GEnie holding all of us hostage?? As of October 1st, they are beginning a new service offering all kind of freebies for a low monthly price of $4.95. To someone who has a need for unlimited Email or whatever else was offered, this is great. HOWEVER, there are going to be a lot of us who have *no need whatsoever* for this service and *if you do not join, you are thrown off the service!!*

Am I nuts or is this extortion, plain and simple?? We go on GEnie for various reasons, myself mainly to use the Conference system and keep in touch with as many of you as possible. But I don't use Email unless I am responding to someone else's mail. I would prefer to use the telephone, fax or even (shudder) an answering machine! SO in effect, I would be paying a $5 surcharge a month merely for the pleasure of remaining on GEnie as a subscriber, and would be responsible for that payment per month even if I didn't log on all year!

Is General Electric doing so bad that they now have to jack their rates?? If so, I would prefer they do it up front. Reminds me of our water company in town. We had a dry year, so to boost efficiency of water use they jacked the rates. A higher rate would make people more cost concerned, they figured. They were right. We slowed right down. Lawns browned, cars stayed dirty, and we saved money. THEN...they noticed they weren't going to make enough of a profit that quarter, so to offset the fact people weren't using enough water, they raised the rates again! Ohhhhh, never before have so few needed lynching by so many before!! Jeez, I don't normally even use 2400 baud. For me it's either 300 or 9600.

And GEnie doesn't even have the tech in place to forseeably offer 9600...ever. I may have to eat crow and return to Compuserve, where it is now a cheaper alternative (for now). My solution is "Let those who wish to subscribe do so, and leave the rest of us to enjoy GEnie as we always have." .

And please GEnie,.....I hate crow!

CACE

Cascades Atari Computer Enthusiasts

Cascades Atari Computer Enthusiasts is the Atari Club in and around Jackson, MI. The CACE BBS is run by the club and open to everyone. The number to call is (517) 764-4047. Current membership dues are $14.80. Any written communication with CACE should be sent to PO Box 6161, Jackson, MI 49204. Our meetings are held on the second Saturday of the month fro 1p.m. to approx. 4p.m. at the Boos Recreational Center. For more information, contact Brent Fisher at (517) 764-4599.

CDACE

Capital District ATARI Computer Enthusiasts

Who We Are: Capital District Atari Computer Enthusiasts (CDACE) is located in Albany, NY and serves the tri-city capital region. Meetings are currently held on the third Tuesday for the XE group and the last Tuesday for the ST group at the Computer Cellar, Westgate Plaza, Albany, NY. Meetings begin at 7 PM with the libraries available starting at 6:30 PM. Dues are currently $20 per year for each family. This includes a subscription to AIM, our monthly newsletter and our BBS. Membership is not required to visit a meeting.

COAC

Central Oregon Atari Club

Dedicated to Central Oregon Atari Users and Enthusiasts Since 1986

President	Norman Moore	(503) 447-3598
ST-VP	Bob Kanski	(503) 548-8201
8-Bit VP	Marc Hitson	(503) 648-0513
Treasurer/Editor	Glenn Dulin	(503) 382-3956
Secretary	Nancy Kanski	(503) 548-8201

Address: Central Oregon Atari Club, PO Box 6824, Bend, OR 97708

Membership dues are $1/month and $1/year for each additional family member. We meet every second Saturday of the month at 5:00 PM at the Ann Rita Conference Center, which lies just in front of the St. Charles Hospital on Neff Road in Bend.

The summer has been lean for members attending club meetings. All that summer fun stuff: vacations, fishing, camping, family get togethers. Some of our younger people have summer jobs that they work. Am I the only one comming to the meetings regularly? The September meeting turned out pretty good actually. Jim Bergen brought a synthisizer and hooked it up to an ST and demoed the new "Band In A BOX" sofware along with showing off his musical equipment. I don't know anything about it, but I was impressed anyway. More people came than I thought would. We even got a newcommer, Greg Coleman, brought along by Mike Viegas. Greg bought one of Mike's STs and is going to use it to help him with his construction business. He is looking for the right software to use and seeing what's available.

I hope that our members are keeping track of when their dues are due. Look at the label on your AIM magazine. You can pay your dues early if you like, your membership will just be added on.

Andy Gray has back to school again. Back to Harvy Mudd College where he begins his third year of computer science courses. Norman's son, David Moore, is also leaving for college, this is his first year. David Powers is moving back to California.

BBS -- go'n online

By the way, for those who don't know, Andy has set it up so that there is an Atari section on a local Bend bulletin board. We can have access to the Bit Bucket at 503-389-5404. This BBS has files and information for IBM, MAC, other Apple computers, and thanks to Any Gray, Atari ST. You will have to do a log on, and I think, a waiting period before full access. Call them up. Me, now that I also have a PC clone there is more for me to look into. Oh my, I may have to join a PC club also! Naaaah!

As you may know, we were visited by Steve Braun from Braun's Computers out of Beverton. I'm sure he will like this advertising for him, but, the point is, being so far away from any dealer, even Steve, we do almost all our business by mailorder anyway. So why not support one in Oregon. Steve is willing to sell to club members at 12% over his cost, This puts prices about the same as you can get from other mailorder outlets. Give him a call at (503) 646-8241. His business address is 3803 SW Hall Blvd. Beaverton, OR. 97005.

See you at the meetings.

CUSTUG Champaign-Urbana ST Users Group

The Champaign-Urbana ST Users Group (CUSTUG) meets at 7pm on the second Wednesday of each month in the Auditorium of the Urbana Free Library at the corner of Elm and Race in Urbana, IL. Membership dues include a subscription to AIM and GLITCH and use of the commercial lending library. New members are welcome. The group supports a local BBS, Blackhawk's Keep, operating 24 hours a day at 3/12/2400 baud (1/8/N): 217-892-5512.

Henry Murphy	President
Jimmie Myers	Vice President
Jim Linder	Secretary/Treasurer
Tim Brumleve	Librarian

FACCS

First Atari Computer Club of Spokane

We currently own and maintain a 24-hour Bulletin Board System (BBS), open to everyone with a 300, 1200, or 2400 baud modem, called the Atari Zone. To enter the Atari Zone call 509-326-5741.

Since we currently have renewal dates scattered throughout the year, please check your card for your current expiration date. Remember, once your membership expires we are no longer able to send you your AIM Newsletter or allow you to remain at the F.A.C.C.S. level on the Atari Zone. To prevent any interruption in your F.A.C.C.S. services please renew by the expiration date on your card.

President	Tim Osborne	509-624-1917
Classic VP	Ron Hoffman	509-487-3520
ST VP	Keith Busch	509-926-9369
Treasurer	Norm Iverson	509-253-4733

FACCS Secretary's Report: New Meeting Place!

Wow! Finally! Important news! The next FACCS meeting will be on Thursday, October 11, 1990, at 7 p.m. at a brand new location! Eugene Bergstrom of Eager Beaver Computers has graciously offered us the use of the basement at his store at W. 920 Garland Avenue, next to the Garland Theater, with access to a nice large parking lot at the back.

In honor of the move, your officers have decided to celebrate with a Game Night for the October meeting! Fun for the whole family guaranteed! Feel free to bring your computer and your PD or original Atari game disks, ST or 8bit (no pirated stuff, please!) and we'll see if we can stage some competitions! Plus, if Gene will "lend" us a phone line, we plan to have a real time demo of the Atari Zone and some popular 8bit modem programs for those of you who are interested (an ST demo will be scheduled in the near future)!

Meanwhile, the annual Northtown Mall Computer Fair has been scheduled for Saturday and Sunday, November 10th and 11th, so mark your calendar and be sure to come! This has always been our biggest yearly event, and those of you who are new members and have never attended are in for a real treat! If you need more information, call one of us and we'll fill you in!

My condolences to all of you who missed the Bob Brodie event in August. Our thanks to Mr. Brodie and to RACE of Montana, RACE of Idaho, and A2-D2 of Tri-Cities for insuring most of us had a great time! We made a lot of new friends in the other northwest clubs, and hope we can make annual meetings with them all a tradition.

Lastly, in general club news, we've decided to make Sundays "FACCS members only" on the Atari Zone BBS, and to limit daily time on the popular on-line game of LFV, as modified by SysOp Greg Morse, in an effort to allow those members who always find the line busy to call in. We're also discussing the option of holding our yearly elections in February instead of November, both to coincide with the renewal date of most of our members and to avoid the confusion of changing leadership in the same month as the Mall Show.

GRASS

GRAND
RAPIDS
ATARI
SYSTEMS
SUPPORTERS

GRASS meets the first Wednesday of every month at the Wyoming Public Library, 3350 Michael S.W.. Doors open at 6:30, meeting starts at 7:00pm. Dues are $22.00/yr. including AIM. Bring in one PD software disk and get 2 blank disks for your time.

President's Monthly: 17 September 1990

Welcome to another month in the life of a user group president. This month I have been exploring a BBS in Ohio, much to the dislike of my wife who gets the phone bill, and have found a lot of good programs to add to our library. We have also received our copy of Daisy-Dot III for the library, which will be available at the next meeting also.

In a couple days, there will be an officers meeting to discuss the upcoming meetings now that summer is on the wane, and attendance is again on the rise. There should be a full report at the next meeting. If you have some special request for a demo or study project, don't hesitate to ask, for it is your needs that we are tring to satisfy. It is by a request that we will cover the use of SpartaDOS again. Most members have SpartaDOS, but because of the unfamiliarity with the way which this command type DOS functions, many have yet to begin using it on a regular basis.

We are also in need of someone to do the demo on Daisy-Dot III for the whole group. If you are interested, let me know at the next meeting or just give me a call, and you can have the job.

I am looking forward to a very interesting and rewarding computer season this year, and hope many of you will join in. Welcome back.

See you at the meetings, and bring a friend.

Tim

Key Master	Terry Booth	
BBS Number		(409)722-6526

Congratulations to all the officers and thanks to last years group. May we all have a fine year in the GTAUG! The GTAUG has been 'around' since 1981 and supports both the 8-bit and 16-bit communities. Meetings are held the first Tuesday of each month at a location announced in the previous meeting.

At present our dues are $24 per year (Our year begins in September.) and is pro-rated at $2 per month for new members the first year. Since our nearest dealer is 90+ miles away, it is imperative that we support each other. It is for this very reason our group is a fairly close and diverse. We support all facets of Atari computing from 8-bit to Spectre/Mac to IBM and MIDI.

HACE

The Houston Atari Computer Enthusiasts meet on the fourth Wednesday of the month, 6:45pm at the Health Economics Corporation, 2400 West Loop South, in Houston, Texas. The club supports all Atari computers from the 400 to the Mega4.

Membership is $22 per year, and gives full access to our BBS (713) 458-9923, access to our disk, magazine and newsletter libraries, a subscription to AIM, and our local news journal UPDATE ATARI. There are also other benefits, such as store discounts, door prizes, workshops, telephone help when you have problems, and much more! For more information, please contact one of our officers or drop us a line!

HACE, P.O.Box 460212, Houston, TX 77056

President:	Bill Kithas	713-855-0815

JACS

Jersey Atari Computer Society, P.O. Box 710, Clementon, New Jersey 08021. JACS BBS: (609) 346-1224

The Jersey Atari Computer Society (JACS) provides a forum through which members may further their understanding and enjoyment of all Atari computers, through the exchange of ideas and information with other users.

JACS holds two meetings per month at the Camden County Library, across from the Echelon Mall in Voorhees, New Jersey. The executive meeting, where all the planning for the club takes place, is held in the 2nd floor meeting room from 7-9 PM (meeting dates vary from month to month). The regular JACS meeting is usually held on the third Tuesday of each month, in the 3rd floor meeting room from 7-9 PM.

President	Mike Hopkins	227-9058
ST Vice President	Maureen Kelly	428-9381
Treasurer	Forrest Blood	877-3579

Layton ACE of Utah

The Layton Atari Computer Enthusiasts (L.A.C.E.) membership cost $20 per year. Privileges include the AIM Monthly Magazine, access to the 8-Bit and ST club libraries, monthly meetings, help and friendship. If you are presently not a LACE Club member and wish to join contact the one of following persons or write to LACE, c/o Irwin Brooks, 3897 So. 2275 W., Roy, UT 84067-3515.

Irwin Brooks,	President/ST Librarian	(801)731-1516
Richard Clark,	Vice President	(801)825-5823
Ken Karchner,	Secretary/Treasurer	(801)776-8015
Lonnie Allen,	8-Bit Librarian	(801)392-4450
Kelly Knecht	ST Librarian	(801)773-5652

The L.A.C.E. Club Meets in the basement of the Clearfield Library every second Wednesday of the month at 7:00 p.m.

Mark your calendars for the next three meetings: November 14 and December 12, 1990.

Attention LACE Club Members: A new rule accepted in the September club meeting now allows for a $5 discount for one year's membership when a new member signs up as a LACE member. The signee must not be a existing or former LACE club member and you must extend your membership at the same time. This offer is good for only one discount per member per year but saves you 25% of your annual dues. It's a great way to save money and a good way to build your favorate club member list.

LBACE

The Long Beach Atari Computer Enthusiasts meet on the second Sunday of the month at 6:00 pm. Meetings are held at Mercury Savings and Loan on the corner of Long Beach Blvd. and Carson in Long Beach. Address is PO Box 92812, Long Beach, CA 90809.

President	Richard Hull	(213) 422-1055
Vice-president	John Saunders	863-2582
Treasurer	Pat Connelly	
LBACE BBS		498-8824

Club dues are $20 annually. The club supports both the 8bit and ST. Members have access to the club's PD library and BBS and receive a year's subscription to Atari Interface Magazine.

M.A.C.E.

The Michigan Atari Computer Enthusiasts

Members of MACE receive, as part of their dues, Atari Interface Magazine. Members are also entitled to purchase disks from the 8-Bit and ST public domain software libraries. 8-Bit disks are $3 each, and ST disks are $4 each. As an added bonus, if you purchase three (3) disks from either library you will receive a fourth disk of your choice at absolutely no cost. Non-Members may purchase disks at a slightly higher rate. Mail order is also available.

For a catalog of current disks in our libraries, send $2 to:

MACE, P.O. Box 2785, Southfield, MI 48037

MACE meetings are held on the Third Tuesday of each month at the Southfield Civic Center at 7:30pm. The Southfield Civic Center is located at 10 1/2 Mile and Evergreen Rd, one half mile south of the Evergreen exit on the new I-696. Meetings are in the small pavilion, room 115. Parking is available in the parking garage below the pavilion or in one of the many parking lots on the Civic Center grounds.

If you have any problems with getting to the MACE meetings, please feel free to call on a MACE Officer to relieve you of your confusion. We are always glad to extend a helping hand!

Please come and join us! We are awaiting your visit!

Meeting Minutes—August 1990

The August meeting of MACE got underway at 7:40pm. Vice-President Ted Newkumet began by informing that the officer elections were comming up next month, and asked the members to consider taking an officers position in the club. After this, Ted gave everyone the latest Atari news and held a discussion about how MACE was operating.

A very short Q&A session then took place. Jonathan Bailey then gave a demo of the new Supercharger IBM emulator. This device lets STers use non-protected IBM programs on their machines. Next up, ray Simmonds gave demos of two games for the 8-bit machines after which Bob Retelle showed off the A.I.M. disk of the month. The members took a short break to examine some of the items shown at the meeting, and then Jonathan Bailey returned with a demo of the I.G.S. emulator. The meeting officialy ended at 9:32pm.

FOR SALE

ST Software: Revolver $5, Outrun$10, Crash Garrett $5, Hippo Computer Almanac $5, Thunder Blader $5, Defender of the Crown $5, Bermuda Projec) $10, Indiana Jones & the Last Crusade$15

8Bit Software: Eastern Front 1941 $5, Final Legacy $10, Atari Programming with 55 Programs & Disk $5, Mannesmann Tally 140L (Unisys) Printer, Wide Carriage Printer $100

Michael Bonkowski (313) 427-3157 after 7 PM

Middle Georgia Atari Users Group

The Middle GA Atari Users Group is the sole Atari Club in the Middle Georgia area. We are composed of 60 members of which approx. half are ST users. Club president Pete Miller can be reached by phone at 912-328-8758. The MGAUG address is 115 Feagin Mill Rd., Warner Robins, GA 31088. MGAUG meets the second Sunday of each month at 1 PM at the Warner Robins Library. Annual dues are $5 with the newsletter optional. Use of the club library is free to all paid members.

. September Meeting

The September meeting had a good turnout with a lively discussion on all things Atari. We discussed whether we should join up with the Atari Users Association. The Atari Users Assoc. will attempt to unite all Atari Users and Users groups under one banner. No conclusion came about as to whether we should join or not. I may wait to see how some of the larger Users Group respond before I decide on if we should join. Jim Menegos from the Atari users group in Atlanta also came to the meeting, I always am glad to see him show up.

As a result of the computer show we picked up yet another new member. Marc Lynn and his family showed up at the meeting for the first time and we are glad to have them as new members. Marc has a 1040ST and plans to purchase a printer in the near future.

Mall Show

The mall show went off without any major problems, except for the president (more on that later). We had 6 members show up with their computers for a fun day. Whether we sparked any local interest may be open to question but we answered a lot of questions and handed out a lot of brochures to anyone who appeared interested. One member described the show as "Kind of like an all day Users Group meeting." This was probably an accurate description of the various activities. We did manage to drag out some of the members of the club that I haven't seen in quite some time and we did pick up one new member so to me it was worth the effort.

As far as myself, I had "one of those days." First of all, I was going to show the tutorial tapes that the club has including the Antic CAD 3D demo tape. However my VCR decided that although it had been working fine for the last 5 years that now was a good time to ask, no demand, that the heads be cleaned. Well after eating my CAD 3D tape and making the tutorial tapes hardly able to be seen, I gave up.

Well, I gave up on that and decided to hook up my computer and start doing some PageStream work. When I hooked up the computer and turned it on -- colors on the screen and a no go. I then used up the next 2 hours trying different cables, drives, extension cords and anything else that I could think of with no help. So I finally gave up on this also and used another member's computer for the duration. To top off things nicely, I was suddenly called in to work and had to leave the show early. So things didn't quite go according to plan for me. When I got home I found that the EZ Ram II ram expansion that I have installed had shorted out against the RF Modulator box. So with a little screwdriver work and adding a little extra insulation on the bottom of the ram board everything is on the up and up.

On the Atari front, the stock is way down but so is every computer stock. Atari had planned to market some new products in the near future. The TT is shipping to developers with a 16Mhz clock, Atari will soon market a new lazer printer for under $1000. There are also rumors that the Stacy has now passed the FCC for use in the home. There is also a rumor that Atari has fixed the problem with the STe and hard drives.

Do to the computer show and the mailing of brochures and information packs, I was unable to have a newsletter or Disk of the Month in September. Hopefully everything will be back on track with the next meeting at the usual time at the library on November 11. I hope that you will be able to attend and that you can bring a friend.

MID-OHIO ATARI USER GROUP

Mid-Ohio Atari User Group Post Office Box 134, Ontario, OH 44862

The Mid-Ohio Atari User Group supports all models of Atari computers. We meet at A&B Computers, located in the West Park Shopping Center on Park Avenue West in Mansfield. Meetings are held the third Saturday of each month from 7:00pm to 9:00pm. Demonstrations are welcomed and pirating is expressly forbidden.

MAUG is a participating club in the Atari Interface Magazine. As such, members receive an issue of A.I.M. each month for no extra charge. Club dues are $7.50 per year for residents of Ohio, and $10.00 per year for others. A monthly disk subscription is an additional $3.00 per year if you pick your disk up at the meeting. Disk subscriptions which must be mailed are an additional $24.00 per year.

The club maintains a disk library for both the 8-bit and ST computers. The library disks are made available at each meeting. There is also a message base on the DataQue Support BBS members to use. Anyone wishing to become a M.A.U.G member can contact Chuck Steinman at the club address or call the DataQue Support BBS at (419) 529-5197 and leave email to the SysOp.

N.A.U.G.

Nashville Atari User's Group

Nashville Atari Users' Group P.O. Box 121752 Nashville, TN 37212

NAUG meets on the third Thursday of each month from 7PM to 10PM at the Cumberland Museum and Science Center. Membership dues are $24 per family for the entire year. With your membership you will receive our local newsletter, Atari News, a subscription to Atari Interface Magazine, access to the club's 8-bit & ST Public Domain/Shareware libraries, any group discounts on products, and entrance to all club related functions. We have an Associate Membership for $12 per year. With this membership, you will receive Atari News, AIM and access to our 8-bit & ST PD/Shareware libraries. People joining during or after the month of July pay 1/2 the yearly rate. Visitors are welcome to all meetings.

President & Editor	Walt Sullivan	(615) 228-7353

O-ACEs

O-ACEs is a non-profit group interested in getting more out of Atari computers. We are NOT affiliated with Atari Corp. or any other commercial organization -- we are there for YOU! We cover BOTH 8-bit (including the 400/800, XL, XE, and XEGS series) AND 16-bit (ST series) Atari computers. We meet twice each month (except November and December) on the 2nd and LAST Wednesday each month. Doors open by 7:30 pm at La Vista Recreation Center, 8116 Parkview Blvd. (just off 84th Street, south of Food-4-Less and east of 84th at the light)

FIRST MEETING: (2nd Wednesday) Covers news, views, and decisions that ALL members might be interested in. FOCUS MEETING: (LAST Wednesday) Concentrated information on a single topic (such as word-processing, spreadsheets, music composition, desktop publishing, etc.)

Call 592-5427, for more info on O-ACEs!

Club Minutes for Sat. September 8, 1990 by Jim Keho

The meeting was called to order at 10am. There were only 12 members and visitors in attendance. It's the record low turnout of the year!! Come on... Where were you? It should be cooling down now so Come On Down!! I don't think you'll want to miss the next two meetings either!

On with general business...

YES, The swap meet is ON for Oct. 13th!! Officially! It will be a Swap Meet & Expo. It will be a combined swap meet with the 8bit group, so if you got an old 400 collecting dust in your closet bring it down too!<grin> ALL Atari computers! There'll also be systems up and running, So if you'd like to bring your system down, bring it! The swap meet will be Sat. Oct.13,1990 9am. to 1pm. at the same meeting address above. COME ON DOWN!

And if all goes as planned we will have one of the Codeheads as our special guest speaker here at the Nov. 10, 1990 meeting! Should be one you won't want to miss! Also coming up is that time of year again, time for new officer nominations. There's going to be a few openings, so if you'd really like to support your club plan on attending and running for an office. You are needed!! I think there needs to be some changes in PHAST this next year to keep it afloat, the sooner the better! So please try to attend and run for an office, or at least be present to vote for who you think will keep PHAST going! Your club needs your participation and support in order to continue! COME ON DOWN! Well that's it for this time, see you at the Swap Meet Sat. Oct.13th!

Membership to PACE is $30.00 per year or $9.00 per quarter. General meetings are held at 6:30pm on the third Sunday of every month. In the event of a holiday, a new date will be chosen and will be posted within the pages of this newsletter and on local Bulletin Boards. Membership includes a monthly newsletter, monthly meeting, FREE Disk-of-the-Month, access to our BBS, FREE printer ribbon re-inking, and FREE copying priveleges to our VAST collection of 8/16 bit Public Domain programs. Ports A.C.E. is an alliance of families with a mutual interest in the Atari Computer and is an independent, non-profit organization. PACE hardware assets: 130XE, 1050 Drive, MacInker and a Supra 300 baud modem. Any written correspondence should be addressed directly to Ports A.C.E., Tracy Hendershot, 4835 Crosley Avenue, Duluth, MN 55804.

From the President...

Due to the fact that a new security system was being installed at our old meeting place, September's meeting was held at the Tom Meierotto residence. We held the business part of the meeting in the dining room, and the hardware portion in two of his rooms on the top level. With the Meierotto's home barely a month old, it was courageous of them to invite us over. Thanks for the pleasant evening!

I ran across something for our 8bit users last week. There are some great 3-D animations circulating out there. Also, there's a new program available called Colorview. It is capable of displaying 4096 colors on your XL/XE/XEGS. That's all I know for now; do some detective work!

Shipping September 4th is the DeskJet 500, replacement for the older DeskJet models. Retailing for $729, it includes 4 typefaces and will ship with HP's new water resistant ink. HP plans to make these new ink cartridges available for its entire line of DeskJet printers in December and they will sell for $20. This may well be the most affordable quality printer available today.

I just received my Fall '90 catalog for J&R Music World. They offer the full line of Atari ST computers and accessories. The 1040STE sells for $599 and the 520ST-FM sells for $329. Great deals! Give them a call at 1-800-221-8180.

My source tells me there is another retailer selling Atari Lynx's in the Duluth area. See them at Childrens Palace near the Miller Hill Mall. Also, profits are up slightly at Atari Corp so business can't be that bad for Atari... or could it? Our next meeting will be October 21st at 6:30. I'll contact everyone as to the location.

The Prez Sez by Rick Reaser

It's time to start thinking about next year's slate of club officers. We will be looking for volunteers to run for the offices shown in club masthead. If you are willing serve, please let one of the current club officers know. We will be holding club elections at our annual combined meeting in December.

For those of you who aren't GEnie subscribers, there have been great changes in GEnie subscription costs. First, the hourly rates have gone down. Non-prime time is $6/hr for all baud rates. Prime time is $18/hr for all baud rates. On top of that, there is a manditory flat $4.95 fee for Star*Services which includes unlimited, non-prime use of GE mail, shopping services, single player games, genealogy SIG and EAASY SABRE to name a few. The features not included are Atari Roundtables and Software Libraries (bummer) and other specialized services. All in all it is a pretty good deal.

The October ST meeting will be demonstrations of high end productivity programs. VP Steve is attempting to obtain demos of DynaCADD, Word Perfect and Calamus. It should be an interesting meeting.

The September 8bit SIG was captivated by John "What other piece of hardware can I buy this month" Sandgren's in-depth presentation of Computer Eyes. One of the most amazing parts of the demonstration was when John imaged Peter Eaton's head and the neither the camera nor the computer broke. Continuing his tradition of bringing new hardware to the masses, John also demonstrated the Game Link which connects two computers through the joystick port for interactive gaming. The Game Link cable is easy to build and the software to drive the ports is public domain and available on GEnie (or from John for that matter).

At the November 8bit SIG, Rick will demonstrate the upgrades to Diamond Write and Diamond Paint both of which operate with the Diamond Graphic Operating system which uses an ST mouse. Textpro 4.55e will also be exhibited.

We have moved the club libraries (8bit and ST) to Citadel Computers, 1835 S. Nevada (behind El Pollo Asada). Remember to return the disks you check out. Say hello to member Cindy Stimits who works there.

R.A.C.E.

Welcome to the second edition of R.A.C.E. Notes via Atari Interface magazine! I hope that everyone is enjoying the magazine, the people at Unicorn Publications definitely have a lot to offer our club. October should be a very exciting month for our club. The Atarifest will be held on October 6-7 in Reston, Virginia. The majority of the club is going to the show and we should see many interesting things there. RACE will be taking 19 people and the Fayetteville users group will be taking 6 people. October is the projected release date for the TT from Atari. Hopefully, they'll get it out the doors in time. Keep your fingers crossed gang! The month of September was a very busy month for the officers but not a very active month on behalf of the club. No one is calling us anymore, no one is interested in our mini-meetings, what's going on gang? Due to a lack of interest, the mini-meetings have been scrapped until further notice. If any of you want to get in touch with us for any reason, please call us anytime.

Eric Schofield 851-5134 Desktop publishing, multi-sync monitors, STe computers, Atari magazines, telecommunications, general information. Brian Casper 851-8092 Memory upgrades, hard drives, Atari hardware modifications or upgrades, IBM emulation, general information. Tony Manino 851-8092 Macintosh emulation, games, telecommunications, programming in C or Pascal, general information. Barry Clayton 362-7835 Club library, good deals on where to buy ST's & peripherals, general information.

Just give one of us a call, we are here to help you and we are all committed to making the club the best that it can be. If enough of you call in a specified amount of time, we can get together one day and have a "mini- meeting". The R.A.C.E. disk subscription is now in effect. For only $24 a year, you get 2 disks each month. These disks contain 8 issues of popular ST online magazines, games, utilities, clipart, and demos! We'll save you tons of time from downloading yourself and lots of money off service charge fees from

GEnie or Compuserve. For more information, give Eric Schofield a call at 851-5134. Next months meeting! October 23, Richard B. Harrison Library Auditorium1313 New Bern Avenue 7-9 p.m. Please notice that the 23rd is a Tuesday, not a Wednesday.

October's program will feature Spectre GCR, the Macintosh emulator! Don Nelson will show us the ins and outs of this incredible device on his Mega ST! You don't want to miss this one!

Rushmore Atari Computer Enthusiasts
(RACE)
3512 Lawrence Dr. Rapid City, SD 57701 (605) 348-6331

The Rushmore Atari Computer Enthusiasts is a nonprofit organization of Atari computer owners not affiliated with Atari Corp. Meetings are held on the third Saturday of each month, 2pm, at the Westminster Presbyterian Church. Annual dues are $12 for basic membership and $15 for membership and newsletter. RACE offers the Black Hills Atari owner hardware and software support and the largest library of public domain Atari software in the state of South Dakota.

NO PIRACY WILL BE TOLERATED AT ANY RACE FUNCTION!

President	Rick Burton	(605)-642-5353
V. President	Gregg Anderson	(605)-348-6331
Secretary	Mike Douglass	
Treasurer	Mike Randall	
NL Editor	Mike Harbison	
ST Librarian	Mark Wolf	(605)-923-2841
XE Librarian	Ken Kayle	(605)-343-7289

President's Particulars

HEAR YE, HEAR YE! ELECTIONS & SWAP MEET!

Well, it's that time again. Time for elections. The month of October brings many things with it including cooler weather, fall colors, Columbus Day, Halloween, and the RACE Election and Swap Meet Gathering. All of these were in order of increasing importance, of course. Bring your nominations, votes, and involvement to the meeting. We will be doing the changing or keeping of the guard as the case may be and then get on with the swap meet. Which brings me to the next urgent announcement.

Bring those dusty hardware and software items to the October swap meet and get them in the hands of some handy hacker who really needs or wants them. If you have none of the above, then bring your money and take advantage of some real bargains. I'm still using a great flight simulator, reference book, and etc. obtained at a swap!

There was some very interesting interaction and discussion about use and capability of spreadsheets at the September meeting. Iron sharpens iron. We all gain much from each other.

By the way, whether I am replaced or continue as the prez, it's been a great year. Thanx for the support!

Rick Burton

RACC
ROCKFORD ATARI COMPUTER CLUB

WE'RE NOT JUST PLAYING GAMES ANYMORE!

We meet at Rock Valley College, the third Saturday of each month. Meeting time 9 to noon. We support the Super 8 and Sweet Sixteen Atari computers, the Atari company, and our fellow Atari owners. Support is also provided through BBS Camille 815-397-5327 @ 300, 1200, and 2400 baud. Our meetings include coffee and rolls, for refreshment; business events, and demonstrations of new and interesting equipment and programs.

President	Andy Learner	815-397-5316
8 Bit VP	H. Jake Olbrich	332-5303
16 Bit VP	Mark Kunkel	874-5546

SEVAC

South East Valley Atari Connection meets the third Saturday of each month at 10 AM at 3234 S. Fair Ln. (Eaton Business Park, just off of 48th Street and Southern), Tempe, Arizona. Yearly membership is $12.00. Membership includes reduced prices on PD ST and 8-bit libraries and monthly newsletter. Club officers are:

President	Tim Barr	(602)821-1200
Vice President	Marc Dyer	(602)897-0314
Treasurer	Lee Whiteside	(602)962-9415
Secretary	Blaine Nelson	(602)964-1949
Disk Librarian	Mike McKittrick	(602)982-9065
Publication Lib.	Walt Schultz	(602)897-7098

Minutes for September 15

The Meeting convened with 12 attendees. Marc reported that CopperState Business Systems in Chandler is closing out its line of Atari hardware and software, with remaining software at 80% off list. The members voted to purchase a 520 ST for $279.00 to set up a club BBS to be operated by Lee Whiteside.

Several of us are planning a trip to COMDEX at Las Vegas during November 12-16 to check out the new stuff being sold to dealers this year.

GEnie has announced a new price structure with a $5 a month minimum that includes many services at no extra charge including E-mail. All computer roundtables and software libraries (the most profitable areas) will be $6 per hour at 300-2400 bps. This is clearly an attempt to compete with the Prodigy service. We are still planning a demonstration of the GEnie service for our November 17 meeting.

The demo of the day was a face off between the MiGraph and Datel Rio hand scanners using the Handi Scan software supplied with the Datel unit. Both regular and gray scale scans were tried with each scanner and printed out using Pagestream on a Deskjet printer. The MiGraph scanner appeared to have a slight edge in output quality. Tim also brought his Marstek 105 scanner. It comes with only an IBM interface. All three units appear to be OEMed by the same manufacturer.

From FACCS to All Computer Enthusiasts

Please Help us so Craig can achieve his goal!

Craig Shergold is seven years old. He has a tumor on his brain and has very little time to live. His last wish is that he be recorded in the Guiness Book of World Records as receiving the largest number of Get Well cards by an individual. Would you join me in sending Craig a card or letter? His address is:

Craig Shergold
36 Shelby Rd
Carshalton
Surrey, England SN8 1 LD

SAGINAW/TRI-CITY ATARI USER GROUP
STAG

The Saginaw/Tri-City Atari User Group meets the last Saturday before the 18th of the month, at 9am, at the Rudy Zauel Memorial Library, on the corner of Center and Shattuck in Saginaw Township.

President	Bryant LaFrenier	(517) 835-2234
ST Librarian	LeRoy Valley	(517) 686-6796
Tres./Sec.	Marty Schmidt	(517) 792-6029
8bit Librarian	Ted Beauchamp	(517) 686-8872

Club dues are only $20, which provides support for both the 8bit and ST, and fill access to the club's Public Domain library, along with a year's subscription to Atari Interface Magazine.

Problems with Group Notes: I am sorry that you did not get any notes for the last issue due to a communication problem at my house. My phone lines have been getting noisy and my modem can not connect to an outside BBS. While I am trying to solve that problem, I will enlist several other members to transfer my notes to AIM every month so we can tell the outside world how great the meetings have been lately.

August Meeting: Well, there were six members present and one of those was a new member, Darryl Ziegler, who just signed up. There was disappointment expressed by one member concerning the future of the Atari Corp. and his desire for our club to do something that will "make a difference" in Atari's operation. I wish that we could do something but FIRST we need to take care of ourselves to preserve our club's existence! To help in reminding our members to show up for the meetings, I will try to implement a "postcard reminder" program, in which a postcard will be sent to the members about a week before the meeting. The postcard will have a brief list of upcoming demos, an "equipment-volunteer" reminder note, and other important information.

I submitted a new logo for our club. With the small audience that we had, the membership that was present approved for the use of the new logo. Hopefully, you will see it in this newsletter.

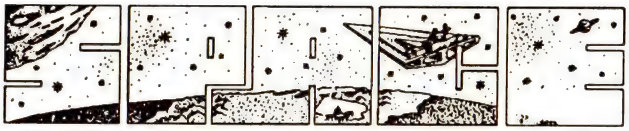
September Meeting: We had 15 people show up for the September meeting (a pretty good crowd). The "postcard reminder" system appears to have worked out quite well and a number of members mentioned that they really like that sort of reminder. We will expand this "postcard reminder" to some old members that have not renewed, in hopes that they come back. Other incentives discussed for bringing in new members (and will be implemented) are giving a free floppy that contains a listing of all the files in our public domain library to all members. The listing will be in a database form that can be used with the cataloging program, STDCAT, which will also be included on the disk. These catalog disks will be passed out at our October and November meetings. A hardcopy list of the catalog will also be present at all meetings.

Telecommunications was the topic for the ST and home filing systems for the 8bit. LeRoy Valley demoed the following programs for telecommunications: HagTerm Elite v3.3, Flash , Interlink, and Stalker. By the way I would like someone else to volunteer for demos in future months so LeRoy can take a break from all the demos that he has performed in the past year (and the year before that, and before that, and before that). Check the features and the price differences of the other programs to see what features that you would want to pay for. Remember, you pay for want you get.

The 8bit group focused on a Home Accountant program from the Atari Program Exchange. The program was on 4 disks and included business expenses accounting and the ability to write checks.

Thanks to the Equipment Volunteers for September 15th: Thanks to Al Jennings for his ST and Bryant LaFreniere for his monitor. For the October Meeting: games demo meeting: Neil Demo will demo StarFlight and Al Jennings will demo Space Ace for the ST. Ted Beauchamp will demo Mini-Golf for the 8Bit. Equipment Volunteers for October 13th are Jim Fleming with his ST and Larry Hennard with his color monitor. LeRoy Valley will conduct the meeting.

Future Meetings: On November 17th, the group will have a hard drive tutorial meeting for the ST. Equipment Volunteers for November 17th are LeRoy Valley with his ST and hard drive and Bryant LaFreniere with his monitor and hard drive. The December 15th meeting will feature our annual swap meet.



All meetings will be held at the Camp Hill Shopping Mall Community Room until further notice. Currently all dates are set for the 3rd Monday of the month.

STANCE

President	Claudette Tishcler	226-5644
Vice-Pres	Gary	521-2855
Treasurer	Kathi Koenig	892-0881
Newsletter Ed	Joseph Adato	449-6881
Disk Librarian	Barbara Carlstrom	371-2732

The ST Atari North Coast Enthusiasts (STANCE) is an independent, not for profit Atari computer user group and is not affiliated with Atari Corporation, or any of its affiliates, in any way.

$12.00 per Year with a one time sign up fee of $13.00.

STANCE club meetings are held every third Monday of each and every month at B & G Electronics, (located at 15729 Madison Ave., Lakewood, Ohio 44107) starting at 7:15PM

ST☆R
ST ATLANTA ROUNDTABLE

STAR (ST Atlanta Roundtable) meets at Shoney's at 6551 Peachtree Industrial Boulevard at 7p.m on the Third Monday of each month. Membership dues are $15 per year. Each member will receive a copy of AIM and a new PD Disk is available each month. For membership info contact Ed Cadow, Claude Brewer Rd, Loganville, GA 30249 or (404) 466-0014.

President	Bruce Hein	(404) 926-0095
Vice Pres.	Les Green	(404) 921-6462

Newsletter Ed.	Jim Menegos	(404) 473-9885

ST CLUB EL PASO

The ST Club of El Paso is the only Atari ST and Mega user group in the El Paso area. The Club has proven to be a benefit not only to new users, but also to the "old hacks" of computing.

We now meet twice a month at the Richard Burges Library, 9300 Diana. The first meeting of the month is always the second Saturday of the month, at 12:30pm. Meetings feature demoes of the latest ST software, as well as help for the those that might be having problems with their computers.

Voting membership is $20 a year, Sponsored and Newsletter only memberships are $15 a year. To become a member of the ST Club of El Paso, call 915-821- 2048, or write the ST Club of El Paso at 10953 Yogi Berra, El Paso, Texas 79934.

President	Tim Holt	915-821-2048
Vice Pres	Morris Miller	594-1906
Sec't/Tres	Joann Anderson	751-2710
Editor	Paul Stampfli	821-4861
Librarian	Norm Bates	593-6234

Salinas Valley Atari Computer Enthusiasts

President	Gary Klugman	758-4894
Vice-President	Dale Meisenheimer	449-7750
Secretary/Tresurer	Charles White	449-8986

Meetings 7:30 P.M., the first Tuesday of the month at the Salinas Community Center.

SWAG
Southwest Washington Atari Group

The Southwest Washington Atari Group was formally created in April, 1985; prior to that, local Atari enthusiasts met on an irregular basis. The group has been holding its meetings at 6:30 p.m. on the last Sunday of the month (save July) at Clark County Fire District #5, Station 3 on 213 NE 120th, Vancouver, WA. SWAG started out with a large following of 8bit owners and as more and more members upgraded to the Atari ST, the membership has become mainly ST owners, but 8bit is still supported. Annual dues are $12 and SWAG can be contacted at PO Box 1515, Vancouver, WA 98668.

Allan Coker	President
Steve Traxler	Vice President
Gary Lentz	Sec/Tres/Librarian
Michael Calvin	Newsletter Editor
The Bear Cavern BBS	(206) 574-1146

TACE
Tinker Ace of Oklahoma

Tinker ACE of Oklahoma meets the first Saturday of each month at 1 PM (12:30 set-up time) in the Moore Public Library, 225 S. Howard, just off of SW 4th and I-35 in Moore. TACE can be contacted at 104 E. Northrup, Midwest City, OK 73110 or at the TACE BBS (405) 755-9561, 24 hrs., 3/12/2400 baud, running Oasis 4.3 software with over 60megs online storage. ST & 8bit support. Dues: Full - $20, Correspondence - $15. Dues are prorated at $1.25/month for correspondence membership and $1.66/month for full membership.

President/VP	Greg Ray	(405) 964-3765
Sec/Treasurer	Stephen Moffitt	(405) 732-8449
Librarian	Chris Hamilton	
BBS Sysop	Rick Spencer	
Technical Advisor	Ron Hamilton	(405) 387-5649

UNYACE
Upper NY Atari Computer Enthusiasts

The Upstate New York Atari Computer Enthusiasts (U.N.Y.A.C.E.) meet monthly at the New York State Electric and Gas building, on Old Vestal Road in Vestal, New York. Meetings are from 7 to 9 PM in the Auditorium. The next meeting date is March 12th.

U.N.Y.A.C.E. had optional dues of $8 per year. Monthly meetings are informal and open to all who are interested in Atari microcomputers.

Contact C. Todd Krissel, President, at (607) 729-4303 or call the Cygnus BBS at (607) 729-5506 (9600 baud, 24 hrs/day) for more information.

RAM

Ventura-RAM, a charter member of ACE-NET, meets the third Wednesday of the month at the Mercury Savings Bank at 1656 Arneill Rd, Camarillo at 7:30p.m. in the Mercury Room. Membership dues are $24 for a full year, pro-rated monthly. Renewals are only $20 a year. Newsletter membership only is $15 a year, pro-rated. For more information on Ventura-RAM, contact PO Box 1513, Camarillo, CA 93011.

President/Newsletter Ed.	Tim McCoy
Secretary	Toni Peters
Treasurer	Mike Portanova
Sargeant at Arms	Barry Miller
ST Librarian	Dick Chacklin
8bit Librarian	John Lindquist

WACO
Westmoreland Atari Computer Organization

Westmoreland Atari Computer Organization meets the second Tuesday of each month in the North Huntingdon Township Town House, Center Highway and Brownstown Road (just off Route 30 near the Hamilton car dealerships, Irwin, PA) at 7:30 P.M.

Founded in December, 1983, WACO boasts huge ST and 8bit PD libraries. Double-sided disks are only $3 for members, $4 for non-members. Disk catalogs on disk are only $2. The $20 annual membership ($24 for family) now includes a subscription to AIM.

as well as the vocal, consumer-oriented WACO Printout newsletter which features Z*NET. Memberships by mail are welcome.

WACO also operates the WACO Ward BBS, 300/1200 baud. The club was founded to help Atarians support each other. One of the regular features of each meeting is called "Upload" when members share new information or ask for assistance in solving questions. Both 8bit and ST disks-of-the month are demoed as well as new hardware and software.

Since the first Taricon back in 1984, WACO has been represented at most of the northeastern Atari shows from Washington to Toronto as well as having a booth at all Pittsburgh shows.

WAUG!

The Washtenaw Atari Users Group meetings are held every second Tuesday of the month at 7:30 pm in the Michigan Union building on the campus of the University of Michigan on State St. at the corner of S. University in Ann Arbor.

Club dues are $15 per year and provide access to the PD library and subscription to AIM. Meetings feature demos of both 8bit and ST software and hardware. Nonmembers and questions are welcome. Officers can be contacted by calling Craig Harvey at (313) 994-5619 or by BBS at Molin's Den at (313) 451-0524.

The September meeting of WAUG was held on Tuesday, 9/11. Craig called the meeting to order at 7:40pm and, while other helpful persons busied themselves with the logistics of setting up systems for Games Night, Craig brought us up to date on club business.

October will feature a demonstration of the SuperCharger IBM emulator. Bill and Pattie will give us the grand tour of their new toy. November we'll be honored by a visit from Tim Purves, a senior programmer for Michtron and author of the Michtron BBS system. December will be the annual Christmas Party/ Entertainment event with door prizes. 4) January we will be looking at the MiGraph hand scanner along with the TouchUp graphic utility.

Craig described new progress in the planning for the Windsor-Detroit Int. Atarifest and announced the next planning meeting will be held on Saturday, 9/22, so that interested members could also attend.

The remaining PageStream package donated by SoftLogic will be raffled in October. Tickets will sell for $.50 each.

Much of the rest of the evening was dedicated to demonstrations of game packages for both the 8bits and STs. In between demonstrations ST Librarian Bill Rayl described the contents of the disk-of-the-month. Eightbit games demoed included Age of Adventure, Ali Baba and the 40 Thieves, Naval Battle, R.O.T.O., Buried Bucks and a few others I don't remember. ST games included a variety of new demoes of games from the UK that Bill had collected in his travels around the networks: Aquanaut, Fred, Resolution 101, Rotox, Cloud Kingdoms, Back to the Future II, Thunder Strike, and Gran Prix. Jay Skotcher also gave us a few quick crashes with his Hard Drivin'.

WNYAUG meets at 7:30 pm on the first Thursday of each month in room 116E, Bacon Hall at the State University College of Buffalo Campus, 1300 Elmwood Ave.

Dues are $15 for new members and $12 for renewing members. Send checks and correspondance to WNYAUG, PO Box 59, Buffalo, NY 14216.

President	Mike Husband	(716) 825-8486
Vice President	Kevin Packard	773-9325
Treasurer	David Shane	875-5350
Secretary	John Kasupski	
SysOp	Don Koepf	681-0564
8bit Librarian	Norm & Betty Knab	937-6974
The Wizard's Attic BBS		681-1654

Mike, announced the resignation of Marty, our secretary/ treasurer, for personal reasons. The office of treasurer was filled by the appointment of Dave Shane to the position after he volunteered to execute these duties. The office of secretary was filled by the appointment of John Kasupski to the position after responding to a request of volunteers.

Mike, Don K (and a cast of thousands) tried to demonstrate Print Shop and Print Shop Companion. Don K. (and others) then demonstrated AtariWriter 80 with the Atari XEP-80. The Split Club jackpot was won by John Tally.

President's Notes: The demonstration of Print Shop and Print Shop Companion was a disaster. I was planning on using the XEP-80 as the printer interface for Print Shop and PS Companion. I have been using a TRAK disk drive with the builtin printer interface and was thinking the XEP-80 had the same kind of builtin printer interface. I was in shock when Don plugged the XEP-80 in the joystick port. We'll have to reschedule the Print Shop demonstration. I would like to inform the user group that we're not on a desert island. Lonnie Hudkins knows we're alive. He directed an Atari user who needed help with his Atari. I would like to thank Dave Shane and John Kasupski for volunteering to fill the offices.

BEST ELECTRONICS
New Product Release

ST/MEGA Compatible Mouse

Features:

- Opto-Mechanical Design for Maximum User Sensitivity
- Ergonomical Design For Optimum User Comfort
- High Resolution Photo tracking of 200 Pulses per inch
- Replaceable Teflon wear pads (feet)
- Teflon rollers on the steel photo optic interrupter shafts for maximum smooth operation and ease of maintenance/cleaning
- FCC certified to comply within the limits for a Class B computing device
- Full ST/MEGA owner support with replacement parts
- Compatible with 8-bit GEM operating systems
- Model CBM1 Mouse - Suggested retail of $49.95

Now you have a second choice for mice you can use on your Atari ST/Mega* computer system! You will find because of its unique shape The Best Mouse can be used for many hours of uninterrupted computing work with little or no fatigue. Most Atari owners who have used The Best Mouse agree, they would not switch back. See your local Atari dealer for your free TEST RIDE of this new premium mouse today or contact:

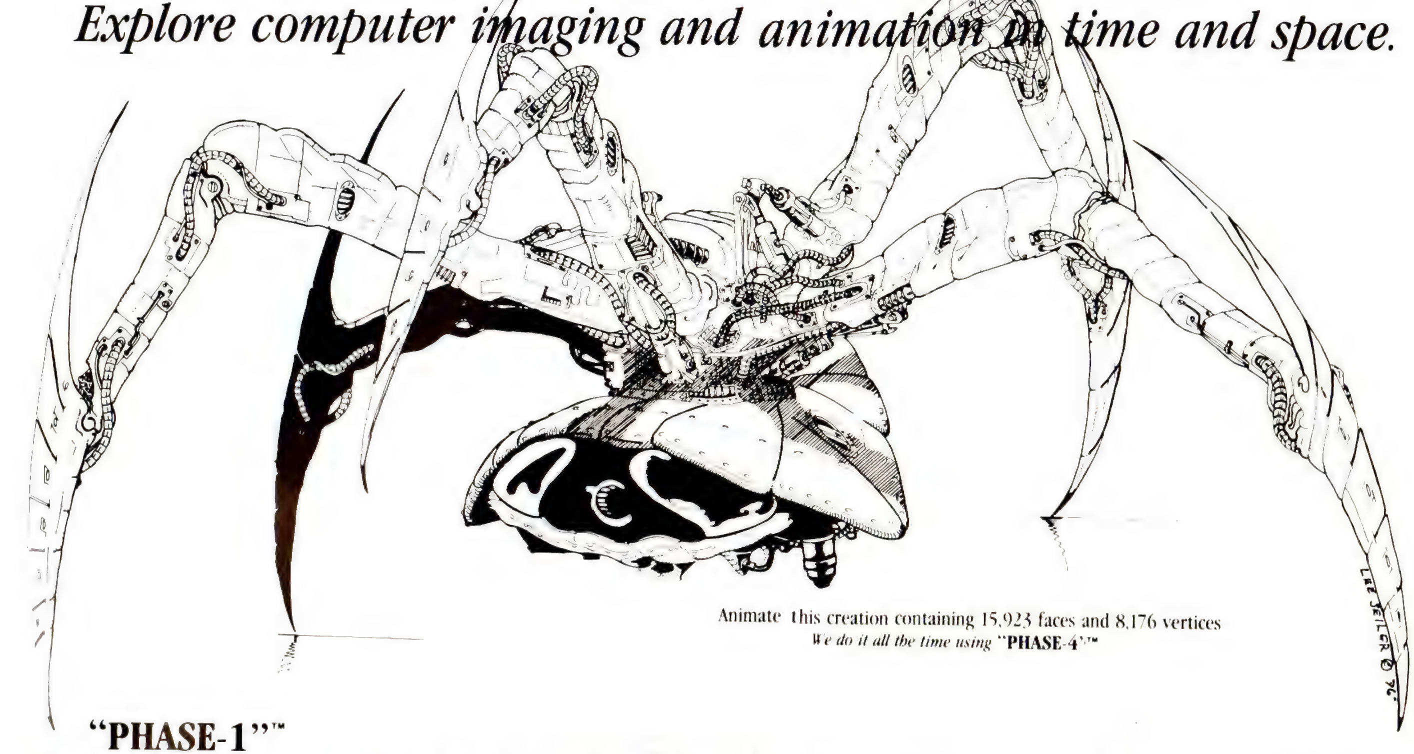
DISCOVER THE 4TH DIMENSION

Explore computer imaging and animation in time and space.



Animate this creation containing 15,923 faces and 8,176 vertices
We do it all the time using **"PHASE-4"™**

"PHASE-1"™

ROSETTA-3D

Just as the original ROSETTA STONE allowed scholars to decipher the secrets of Egyptian hieroglyphics and translate them into other languages, ROSETTA-3D allows you to translate a wide variety of the most popular CAD, animation, and rendering formats. Files created by ROSETTA-3D can be transported to many different computer systems and modeling programs or may be sent to remote rendering services capable of creating photo realistic quality images for commercial use. You are no longer confined to the limits of one machine or your current animation software. ROSETTA-3D Object Viewer is much more than just a file translator, it is also a draft animation package. It allows you to quickly create and preview an object file you wish to animate in "PHASE-4's" CHRONOS Keyframe Animation Studio, from any format that you select using the fastest wire frame and solid-polygon render available for the Atari ST™. ROSETTA-3D's simple point and click animation system features a unique three dimensional "object-marker" which enables you to design animation story boards for waiting clients in a matter of seconds. *Price $59.95*

ROSETTA-3D FEATURES:

File Translation:

Direct translation from one format to another format. Translate objects which are too large to animate on your system. File size not limited by system memory size.

Import and/or Exports: Eight Three-Dimensional Modeling Formats Supported.

- AutoCAD Release 10 ASCII (DXF), Binary (DXB) for the IBM and Macintosh.
- CAD-3D Version 1.0 (3D) and Version 2.0 (3D2).
- PHASE-4 Animation Libraries (LIB).
- Sculpt-3D for the Macintosh and Amiga.
- Swivel-3D for the Macintosh.
  ... and output of P.I.X.A.R.'s Renderman RIB files!

Animation Capabilities:

- Fast Depth-Cue "Point Cloud" mode, for real-time playback of extremely large objects.
- High speed wire frame and depth-cue wire frame modes.
- Several solid-polygon modes.

Object limitations:

- Any combination of 65,000 vertices and faces per object.
- Total number and size of objects limited by memory size only.
- Animate objects with over 15,000 vertices and 30,000 faces on 1Meg systems.
- ROSETTA-3D expands ANTIC™'s original 3D universe in all directions to more than 400 times its original size.
- Full 24 bit color - w/16 million colors
- ATARI TT/68030 VERSION.

DISK, FILE, and FOLDER Management Supported.

"PHASE-4"'s (ADEPT) Supported.

Object limitations:

- Any combination of 65,000 vertices and faces per object.
- Total number and size of objects limited by memory size only.
- Animate objects with over 15,000 vertices and 30,000 faces on 1Meg systems.
- ROSETTA-3D expands ANTIC™'s original 3D universe in all directions to more than 400 times its original size.
- Full 24 bit color - w/16 million colors
- ATARI TT/68030 VERSION

PRISM-PAINT

(Photo realistic Rendering Interpreter for Solid Modeling in Advanced Graphic Environments)

PRISM-PAINT 1.0 is a powerful drawing program that runs in all ATARI resolutions plus 1024X768 4096 color mode and 24 bit true color with 16 million on-screen colors and is fully TT-32 bit tested and 68030 compatible. Not only will you find many of the features expected in a drawing program (such as boxes, circles, ellipses, area fills, cut, copy and paste, (with fine pixel editing), but also explores some rather unique areas of it's own! One of the more interesting areas of **PRISM-PAINT** is that it uses **PRISM-TABLET** (Graphics Tablet Environment) which supports the new Cal-Comp graphics tablet in four resolutions. Another feature of **PRISM-PAINT** is that it uses all of the computer's memory to support multiple picture buffers. This can range from approximately eight buffers on a 520ST to over 110 buffers on the MEGA4 ST, which allows the creation of animations using the built-in slide-show features. When used in combination with other PHASE-4™ programs **PRISM-PAINT** takes full advantage of ADEPT* and the Image Systems ISAC High-Res color board. *Price $49.95.*

COMPLETE HIGH RESOLUTION ARTIST PACKAGE: This package is intended to upgrade any MEGA ST computer to full color graphics workstation status. ARTIST PACKAGE Release 1.0 features 4096 color palette support with/24 bit 16 million colors available in the professional package. When used with Syquest 44 HD system, the artist can create real time animations up to 55 minutes long in all supported color platforms/with full 64 channel midi movie sound track support.

PACKAGE HARDWARE INCLUDES: Image system 1024x768 high resolution color board, Pal-800x600 kit. Software included: **PRISM-PAINT** with new high-density, .DLT cluster technology and .FLM file formats. TT-GIF file display program. Cal-comp Tablet driver with LEXICORS ADEPT pipeline imbedded in all programs allowing full upgrade compatibility for the professional 24-bit 16 million color **PRISM** photorealistic rendering programs. Animation and GIF art disk designed to get the artist started right away. Compuserve online certificate for LEXICOR on line access to **PHASE-4** tutorials and online support.

Artist package priced @ $775.00 plus $5.25 Shipping and handling.

PRISM-TABLET is a fully functional graphics tablet environment designed to be used with all "PHASE-4"™ programs. This feature is embedded in all programs and available as a stand-alone program which can be used with most well-behaved ATARI programs. *Price $29.95 if ordered separately.*

For more information write or call Lexicor Software Corp., 58 Redwood Rd., Fairfax, CA 94930, (415) 453-0271. Dealer inquiries welcome.

MUG SHOT! $39.95

Parts is parts, they say, but with MUG SHOT! parts add up to a whole lot of fun and practicality. Extra data disks are available for only $19.95 so you'll *never* say, "Gee, is that all there is?". The possibilities are truly endless.

- Save as IMG, Degas or .MUG file.
- Prints in 4 sizes to Epson 9/24 pin, HPDJ, HPLJ, SLM804, KXP4450, and more.
- Works in color and monochrome from minimum 512K to TT RAM!
- Optimized for use with big screen monitors.
- Comes with a set of famous faces and a cartoon set for kids of all ages!

Addtional Data Disks: Mr. Veggie-head, StereoTypes of the 90's, Real People

Loadable data files means infinite possibilities!

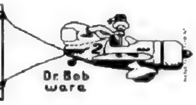
IMAGE CAT $24.95

The complete **Graphics Cataloguer**! Can't find the right picture? Look in *your* catalogue of *your* art and find just the right pic for your needs in seconds!

- Fully automatic, fully loaded. Prints up to 15 pics per page!
- Automatically prints up to 28,700 files with ONE click of the mouse!
- Catalogues *your* IMG, PI#,PC#,NEO,TN# and MAC files without hassles
- Does not require GDOS
- Prints to Espon 9/24 pin, HPDJ, SLM, HPLJ, NEC, KX-P4450&20
- Catalogues color pics with your choice of dithering for best print quality!

Get IMAGE CAT and get the picture!

MVG $59.95



Dr. Bob's Handy Dandy **M**ulti**V**iewer **G**raphica: *ALL NEW* MVG ***version 2.0***
Do more than just touch up your graphics. And do it 16 times faster! Cut your editing time in half then in half again! Written in 100% optimized machine code!

- Now compatible with big screen monitors!
- Loads & saves IMG, PI3,PC3,NEO, MAC- plus saves in TRUE-MAC format!
- Built in fonts or import GDOS fonts *without* using GDOS
- Best Cut-n-Paste *ever* for the ST!
- Image size limited only by available memory.
- Modules available for the Geniscan/ST™ and the Migraph™ hand scanners. (G:$14.95/M:$19.95)

Do it *better, faster* and *easier* with MVG!

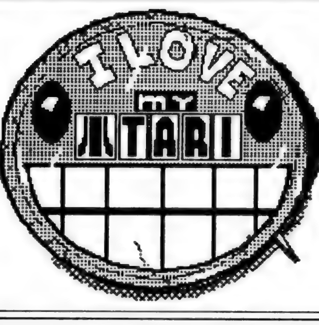
AIM is produced on a 4 Meg Atari STe, HP Laserjet II with PacificPage Postscript cartridge, PageStream and Calamus.



ATARI BULLETIN BOARD

by Bill & Pattie Rayl

As winter approaches, the personal computer market is heating up like a summer day in the Sahara. This column doesn't normally focus on the industry as a whole.However, recent events may have a direct impact on Atari's future in the market.

Apple has revamped their line of Macintosh computers and slashed prices in a bid for market share. The low-end Mac Classic is a repackaged Mac SE with a suggested retail of $1495. The Classic is selling for as low as $729 to $795. For that price, you get a 68000 machine with two megs of memory and a 20 meg hard drive.

The 68030 Macintosh IIsi, the new top-of-the-line color model, has a suggested list price of about $4900 but can be purchased for $3800 or even less. The mid-range 68020 color Mac LC is not yet available, but has a suggested retail price of just over $3000.

Apple currently has about a 10 percent share of the entire PC market, with IBM itself having only around 15 percent, according to Dataquest figures. Although the new strategy from Apple is aimed to knock IBM out of the number one spot, it could have a negative impact on Atari's and Commodore's ability to sell machines in the low price PC market. You can now buy a Macintosh for less than a comparable Atari or Amiga system.

What's NeXT?

At the same time, the NeXT machine is reportedly ready for its US assault. The low-end monochrome NeXTstation has an announced retail price of $4995. It comes with 8 megs of RAM, a 25 MHz 68040, 105meg Quantum drive, 2.88 meg floppy (not optical) drive and built-in Ethernet capability.

The NeXT also has a chip that can function as a FAX modem or normal modem. The chip can also generate CD quality sound. The NeXTstation also comes with display Postscript, the NextStep interface on top of a Unix operating system and a good "starter kit" of software.

The NeXTstation color system comes with a 16" color monitor, 12 megs of RAM, and a 16-bit color display. Retail price is $7995.

The monochrome machines are scheduled for quantity release in November, with the color systems coming in the first quarter of '91. Already available for the NeXT are packages such as Word Perfect, Adobe Illustrator and a talking spreadsheet from Ashton-Tate. Soft PC for the NeXT allows for IBM emulation as well!

What about Atari?

Although very few details are coming from Atari, there seem to be big plans for COMDEX in mid-November. Bob Brodie, Ken Badertscher and others have stated the TT will be publicly available in time for this show.

It is unknown to us if the TT has FCC approval and no one we spoke to at Atari could (or would) say.

It has also been hinted that Atari will announce major reorganization plans and marketing strategies at COMDEX, but what these plans and strategies are is uncertain.

Also uncertain at this time is the status of Elie Kenan at Atari. Kenan had been put in charge of "Atari North America" and was seen by many as Atari's "last best hope" to make a dent in the US market. Kenan returned to France for a major computer show, and it is rumored he will not be coming back to the US.

Gregory Pratt, an Atari Corp. vice president and chief financial officer, has reportedly moved into Kenan's position. It is unknown if this is a permanent move. No official announcement has come from Atari at this time.

Jim Fisher is also gone from Atari. Fisher was in charge of sales and marketing and was also "publisher" of Atari Explorer.

Atari US has been renamed to Atari Computer. In recent messages on GEnie, Atari's Bob Brodie has mentioned the change.

New TT Desktop on the ST?

The new TT desktop has a multitude of enhancements, making it more like the Mac desktop or desktop replacements/enhancements from developers.

As reported last month, "bootleg" copies of the TT desktop that run on the ST are being circulated. Atari has, indeed, created a disk-based version of the TT desktop that runs on the ST. The bootleg version floating around is reportedly not the final version.

Atari met with alternative desktop developers CodeHead Software, Gribnif Software and Double Click and discussed release of the disk-based version. Messages on

GEnie from Atari's John Townsend began to imply that Atari would not release the new desktop to current ST owners. The reason given was that it would adversely affect these alternative desktop makers.

In response, CodeHead and Double Click uploaded their opinions on the matter to GEnie. They feel Atari should release the new desktop, as it would help sell more computers and thereby help them sell more software. Apparently, these opinions were originally voiced to Atari in private.

Atari has announced that they will make no final decisions on the new desktop distribution for STers until after COMDEX.

Developer News—DTP Style

Users of PageStream looking for third-party fonts may find just what they need from Dennis Palumbo. Palumbo produces a line of professional, high quality fonts for PageStream. Each disk contains three complete fonts with all foreign and special characters. Postscript and "Dot Matrix" versions are included. Retail price is $34.95 per disk. All of Palumbo's fonts are registered with Soft-Logik and come with a 90 day warranty! Dennis Palumbo, 104 Barrymore Blvd., Dept. B, Franklin Square, NY 11010, (516) 535-7316.

Another excellent source for PageStream fonts is Computer Safari. Jay Pierstorff of Computer Safari designed many of the fonts found on Soft-Logik's own font disks. Computer Safari also markets a series of EPS Clip-Art packages. These graphics can be loaded into PageStream and printed on Postscript printers or phototypesetters. Suggested retail for the clip art is only $29.95. Computer Safari, 606 W. Cross St., Woodland, CA 95695, (916) 666-1813.

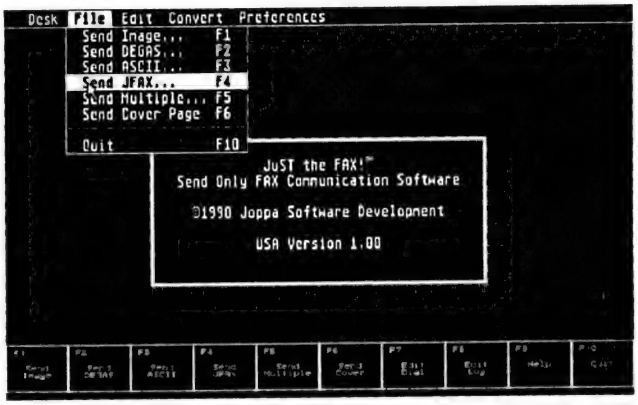
Calamus users also have a few excellent sources for quality third-party fonts. Cherry Fonts produces fonts that "add some of that designer touch to your Calamus documents." Each "Fontpak" produced by Cherry Fonts would be a welcome addition to any professional desktop publisher's "type drawer." Retail price for a Fontpak is $42.95 US or $49.95 Canadian. You can also order any single font and its matching italic version for only $24.95 US/$28.95 Canadian. Cherry Fonts, 2250 Tyner Street, Unit #4, Port Coquitlam, B.C., Canada, V3C 2Z1, (604) 944-2923.

If you're looking something special or out of the ordinary in a Calamus font, M-S Designs is the place to look. From Old English to advertising fonts and various script fonts, M-S Designs has something for everyone.

Currently, M-S Designs has eight font disks, called Groups. Each group contains at least three fonts, with three of the disks supplying four fonts. Retail price is $39.95 per group. You can order all eight Font Groups for only $150, saving over $80. M-S Designs, 611 W. Illinois, Urbana, IL 61801, (217) 384-8469.

FAX Modem from Joppa

Joppa Software Development, a division of Joppa Computer Products, has released JuST the FAX, a 2400 baud modem which also works as a Group III compatible FAX.



JuST the FAX!™
Send Only FAX Communication Software
©1990 Joppa Software Development
USA Version 1.00

The hardware is the same as the SendFAX available in the IBM world. The software from Joppa is what makes this send-only FAX a bargain for desktop publishers on a budget. JuST the FAX comes with printer drivers for both PageStream and Calamus. You can create documents, complete with graphics, and print them to disk using these drivers. Then, JuST the FAX can send this file to one or more locations. All this and a 2400 baud modem, too, for only $169.95! Joppa Software Development, PO Box 226, Joppa, MD 21085, (301) 676-1948. [Ed.: We'll have a full review of this product in our next issue.]

Online News

In mid-October, Lexicor Software held a formal conference on CompuServe. Lee Seiler, Lexicor's president, announced a year-long graphics and animation tutorial to begin soon after the Lexicor area opens in the AtariVendor Forum. This tutorial will consist of weekly lectures/classes, homework assignments and much more. Designed to take a novice through the entire graphic drawing and animation process, these classes are open to the public at no cost above normal CIS connect charges.

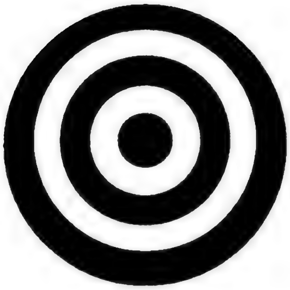
To see what Lexicor's software is capable of producing, check out this month's cover. The artwork was created by Lee Seiler for this issue. Also, take a look at the animation from Lexicor included on this month's AIM ST/Mega disk. We'll be featuring other Lexicor animations on future disks, as well.

Late-Breaking News

Michtron, rumored to be for sale for several months, has finally been sold to Creative Computers. They will be taking over the MichTron name and inventory, and will continue to support MichTron's line of products.

There is no word from Gordon Monnier about his future plans, but Aladdin, the ST's online navigation software for GEnie, was written by Griffin Software and Tim Purves. Gordon is also involved in English Exhibitions, a company to help promote English shows to American exhibitors.

Right On Target



David Plotkin

One of the really nice things about the Atari ST is that you can hang quite a lot of accessories onto it to get it to do what you need. This is surprising in light of the fact that Atari seems to have designed the ST without regard to expandability. At least, you don't have available the "card" slot configurations available on PC-compatibles and the newer Macs.

There *is* the cartridge port and (on the Mega) an expansion bus, but each of these can hold only a single device at a time. Further, there are limits to what you can plug into the cartridge slot, as it is not a full bus.

Developers in the ST world seem to be more inventive than most, and have figured out ways to do things Atari never anticipated. The down side of this is there seem to be more versions of STs around than there are species of insects, and doing things that Atari didn't anticipate means that sometimes (perhaps too often) the hardware doesn't work quite right.

Most of the hardware changes from Atari are "minor" revisions, such as a slightly different version of a chip, or a chip that is soldered in on one version and socketed in another.

Still, it is just these kinds of inconsistencies (usually done to effect some minor cost savings) that cause hardware developers fits. The saddest story of all is pcditto II, which is off the market as far as I can determine. Because of timing differences between different models of ST, it didn't work in a significant number of machines, causing havoc and untold damage to Avant Garde's reputation.

The developers keep trying, however, and success stories are even more astounding than the failures. JRI is a good example. They produced the first high quality, workable genlock for the ST, and it is in general use in a variety of professional environments.

Zubair Interfaces' Zkeys lets you connect a PC keyboard to an ST. Why would you want to do such a thing? Well, for many, the 520/1040 ST keyboard is less than ideal. Its response is flat, and the angle causes some wrist problems for people who must use it for lengthy periods of time.

With the wide variety of available PC keyboards, anyone should be able to find an acceptable replacement keyboard.

Moving on to Monitors

Another area of activity is monitors. While the Atari monitors are decent, you do need two if you want both the rock-steady monochrome image and color. Further, here again the quality varies, depending on what version of a particular monitor you happen to have purchased.

This is especially noticeable in the color monitors. Early ones (like I have) were excellent, but later ones suffered from Atari's hunt for additional profits—they are lower cost (to Atari, *not* to you and me) and the color saturation and quality suffers.

Also, monitor availability can, at times, be problematic. There was a long stretch of time when no monochrome monitors could be had at all. When they finally did become available, color monitors were in short supply!

The first answer to this came from the folks at Talon Technology in the form of an external box for STs to plug into multi-synch monitors.

Multi-synchs are sophisticated monitors that can synchronize to different video signals. Without getting too technical, what this means is that you can do monochrome *and* color on a single monitor.

Good quality multi-synch monitors are not cheap (starting at around $350 and going up to $2000) but they are easy to find (PCs use them also) and are available in a range of screen sizes up to about 19", so you are not stuck with Atari's small screen size. Further, many ST owners are also PC owners (including yours truly) and *already* own a multi-synch monitor.

Of course, there are other ways to go about getting an alternate screen. Moniterm monitors are large monochrome monitors that are just a joy to work on, especially when using desktop publishing or CAD packages.

Because the screen is large, you can see far more information. That is, of course, if your program is compatible with the software driver that powers the Moniterm. Most of the important ones are, or updates have been released that are compatible.

Even more intriguing is the ISAC board, which basically does a "color Moniterm." Again, a software driver and interface board are required, but you can now use color on a big, high resolution screen. Far fewer programs are compatible with the ISAC board, primarily because it functions in low resolution color mode, and many "serious" programs don't work in low resolution. The ISAC board also requires a very high resolution color monitor that goes beyond the "normal" multi-synch range. These can be expensive.

Let's see, what else do we have? Oh yes, disk drives. The hottest thing in both the PC and Mac markets are high density 3.5 inch disks, which can store 1.44 meg on each disk. This is pretty incredible—you can back up a 40 meg hard drive on only 29 disks. Unfortunately, we don't have 1.44 meg floppies available for the ST. Or do we?

DreamPark Development has a board called the "PowerDrive" that will allow attaching a 1.44 meg floppy to your ST, either externally or by replacing the internal drive. This board does require replacing the disk controller chip, which is a bit tricky because it is soldered in.

Also, as of this writing, machines equipped this way can no longer read/write Mac-format disks when working with Spectre GCR, though Dave Small is said to be working on this.

The disk drive you use to connect to this board must be one of a limited number of brands. Apparently some of the high density drives don't do a density detect properly and thus won't work with the Powerdrive. There is even rumored to be another option that doesn't require replacing the disk controller chip, though I haven't seen it myself.

Increasing Memory on the ST

Quite a few companies have gotten into the memory upgrade business. You need to be careful though—there are more horror stories surrounding memory upgrades and the companies that do them than any other upgrade (except perhaps for pcdittoII).

I have had personal experience with two companies that make memory upgrades—JRI and Zubair. Both make excellent, well-engineered products. Zubair, in particular, has a line of solderless upgrades that are exceptionally well put together. Depending on your machine, you may need to disconnect some resistors, but this is quite simple, even for someone with no soldering prowess.

Accelerators are another hot topic. Although the 68000 microprocessor that drives the ST was great for its time, the natural progression of users to more power and speed has led to an effort to enhance the ST's performance. Initially there were two accelerators available. The first, from JRI, only provided about 10-15% speed increase, though the processor itself was running at twice normal. This is because everything else in the ST was still tuned to the original speed. Every time the processor had to go "outside" to memory or a support chip, it had to wait for this outside support to catch up.

Jim Allen did JRI one better by bringing out T-16, a board that provides 30-50% speed increase. It does this by keeping a small cache of very fast memory on the board itself. This memory is fast enough to keep up with the fast processor.

What happens is that when the T-16 loads instructions from regular memory, a certain amount of those instructions are stored in the fast cache. When the processor needs more instructions, if those instructions are in the cache, then the T-16 doesn't have to wait while regular (slow) memory responds. It makes quite a difference. This scheme is used in fast PCs and Macs as well.

Quite a few additional accelerators are just about to hit the market, including a rumored one from Gadgets by Small that uses some sophisticated memory management techniques and a 68030 processor. Such an accelerator board has been seen recently in Germany, but no plans are in the works to bring it here. Gadget's board could conceivably even outrun the TT (at least, in its original 16 MHz configuration). It should be interesting to get ahold of one.

One caveat, though. Compatibility will suffer on machines equipped with a 68030—because this chip does do things differently than a 68000, and programs that "broke the rules" (sometimes ya gotta!) won't work. But then, that will be true of the TT, also.

Well, it looks like we're out of space for this month, so we won't get to talk about such niceties as internal hard drives and such. Maybe next time. See you then.

SQ44-ST Removable Cartridge Hard Drives

Starting at $779 Complete!

All SQ44 systems come ready to run on the Atari ST with 1- SyQuest SQ555 Removable Cartridge Drive. 2 Year Warranty on drive - 20Ms access 600K/Sec. 1 SQ400 cartridge filled with 44Megs of PD software, fully wired for 2 SCSI drives, SCSI/DMA host with formatting software, cable, DMA in & out ports, fan, and *FREE SHIPPING* to 48 states.

SQ44-ST Cartridge Drives

Shoebox/Supra...........$779
Supra Host w/clock, 2 drive slots 7"w x 7"h x 15"d
Shoebox/ICD.............$799
ICD host, 2 drive slots 7"w x 7"h x 15"d
Shoebox/ICD+.......... $823
ICD+ host with clock, 2 drive slots, SCSI port
UnderMonitor/Supra...$819
2 drive slots, clock, 15"w x 3"h x 14"d
UnderMonitor/ICD...$835
ICD host, 2 slots 15"w x 3"h x 14"d
UnderMonitor/ICD+...$858
ICD+ host with clock, 2 slots, SCSI port
Compact/ICD+............$857
ICD+ host w/clock, Single drive 6"w x 2.6"h x 13"d

NEW! Dual CPU $995
Under Monitor or Shoebox cased unit with SCSI/DMA switch allowing use of *ONE DRIVE* on the ST, IBM, Amiga, and Mac with the flip of a switch! ICD+ Host, SCSI port, SCSI/DMA switcher, and SCSI ID selector.

MIDI Rack Mount Shock Mtg. .. **$939**
SQ555 Drive only............$499
SQ400 Cart's..**$89 3+..$82***each*
3.5"/5.25 Floppy Installed........**$99**

Complete ST Hard Drives

PageStream in Color

Bill Rayl

Recently, we've taken a good overall look at Soft-Logik's PageStream (see June/July and November '90 issues). This article focuses in on one of PageStream's finest qualities—its four color process capabilities.

PageStream is the first package to bring full color desktop publishing to the Atari ST. And, it does so with a flexibility and ease of use that outshines most other desktop publishing (DTP) packages on *any* computer.

Color Definition

The PageStream manual gives a pretty good overview of color and the various color definition systems the program uses. You use these systems to define your own colors and add them to PageStream's list. PageStream can recognize over *282 trillion* colors.

Although you can define more colors than you'd ever possibly need, PageStream can only display four colors in medium resolution. Of course, on a monochrome monitor, you only get black or white. This is due to the ST's own limitations. Because of this, PageStream allows you to tag a screen color to the actual color you've defined.

For example, the predefined color Dark SL Blue appears black on a monochrome monitor. That's because Dark SL Blue is tagged as black, so all objects in this color are displayed in black.

Using a color monitor, you can tag Dark SL Blue with, for instance, blue. This doesn't give you exact color representation, but it does allow you to get an idea of the *balance* of color on the page.

Because Soft-Logik thoughtfully predefined several colors, you may never need to add your own at all.

Adding Color to Your Document

The actual process of adding color to your PageStream document is quite easy. First, PageStream will maintain the color palette of any artwork you import, such as DEGAS or Amiga IFF pictures. The picture appears on your screen as only black and white, even on a color monitor. Don't worry, though. The colors are still there.

Adding color text is nearly as simple. Once you've entered your text, select it by dragging the mouse over the text while holding down the left button. This highlighting allows you to perform most of PageStream's attribute setting options on the text. This includes setting text color. From the Object menu, choose Color. If you're into using keyboard equivalents, use the Alt-K sequence instead.

Once at the Color menu, click on the color you want from the presented list. Use the scroll bar/arrows to move up or down the list as needed. Clicking OK sets the highlighted text to the selected color.

Don't worry if text no longer appears on your screen. Remember the above discussion of tagging actual colors to screen colors? Well, some actual colors are tagged with a screen color of white. If your text was originally on a white background, it will look as if it disappeared. In fact, it's just displayed in white on a white background.

As with text, you can add color to columns, lines and graphic objects like circles, arcs and boxes.

Color Printing

Once you've created your color document, it's time to get it printed. If you're using a color printer, printing is very simple...in fact, it's the same as printing to

Color Name: Dark SL Blue

any other printer. You just load in the proper printer driver and print.

Some print and copy centers have a color printer and they charge a per page fee. If you plan to use one of these, you can print your file to disk, using the proper printer driver. Then, you can take in the disk or possibly even upload the file to the copy center.

If you're planning on having your work printed on an offset press, there's a little more to printing your master pages. First, you need to determine if you're doing spot color or if a four color separation is necessary.

If you have no full color pictures on your pages and you're only using one or two colors for text, spot-color separations are probably all you'll need. They're also usually more cost effective than full color separations for one or two colors.

In PageStream, you can print spot-color separations by selecting "Mechanical" on the Print Document dialog box. This will print a separate page for each color used in your document.

Four Color Separation

When using full color pictures or color backgrounds beneath color text, four color separation is the only way to go, both from a cost and quality of print standpoint.

In a four color separation, each page is split into four pages—one each for cyan, magenta, yellow and black. Printers call this *process color separation* and often abbreviate the process as CMYK. When printing a four color separation, PageStream prints the cyan page first, followed by magenta, yellow and black. The black page gives contrast to the full-color page when printed on an offset press.

When doing full color work, you should realize that 300 DPI just isn't good enough for your master pages. The dots on the page are too large to blend adequately on the final printed page. That means you'll need to output to a Linotron or other high-end pagesetter. These are Postscript devices that can output from 1,270 to 3,000 DPI or even higher. You should load the Lino printer driver supplied with PageStream to take full advantage of these devices.

Angles and Frequencies

When doing full color separations to Linotrons, you should also use PageStream's ability to set screen angles and screen frequencies. Screen angles help to smooth out the color blending to avoid moire patterns. Screen frequencies determine the number of lines per inch (LPI) output.

You can, and should, set screen angles and frequencies for your document. Although the PageStream manual mentions *how* to set screen angles and frequencies, it doesn't tell you *what* to set them to and why.

The traditional angle settings, along with the newer settings recommended by Adobe, are presented in the following table:

	Cyan	Magenta	Yellow	Black
Traditional	15	75	0	45
New	105	75	90	45

You can use either set of angles. Both are fairly effective, with the newer angles possibly gaining a slight edge on 1,270 DPI output.

As for screen frequencies, quality improves as the number of lines per inch increases. Newspapers tend to use 85 LPI for their color work. Magazines, which require higher quality, use 133 LPI or higher.

If you plan to output at 1,270 DPI, you should be aware that you will not get true 133 LPI output. You'll get 127 LPI, which is generally acceptable.

If you're a purist, though, you'll need to output at a higher DPI.

You set the screen frequency and angles in PageStream via the Printer Configuration dialog. Just below the area for setting page dimensions, there's an unobtrusive thin line. Clicking above this line will give you a text cursor.

You enter the screen commands here in the following format, assuming you wanted a full color separation at 133 LPI:

```
f[133,133,133,133], a[105,75,90,45]
```

The PageStream manual states that you can enter these commands in any order. Some pagesetting hardware, however, seems to work only if you enter the frequency command first, as shown above.

Service Bureaus

Now you're ready to print your master pages! Chances are you don't happen to have a $40,000 Linotron in your basement. That's where a service bureau comes in. And, choosing one may be the most important decision you make in the whole printing process.

Most problems you're going to meet in this whole color printing process are now about to begin! First, printing Postscript color separations to disk can easily eat up 500-900K of disk space. That means they won't fit on a floppy disk. Since most service bureaus use Macintosh computers, the only compression they allow is Stuffit. There is no compatible compression utility on the ST. Unless you own a Mac emulator like Spectre, you could be in serious trouble.

Most service bureaus have bulletin boards to receive files via modem. Unfortunately, most of these systems have only one upload protocol—straight Xmodem Checksum. A lot of errors creep into uploads to service bureaus. Having to reupload your large file two, or even three, times is not unlikely.

Luckily, there's a way for PageStream users to avoid this headache. There is at least one service bureau that accepts PageStream files...and they speak Atari! Sonata Typographers of Fairfield, Connecticut is a truly great service bureau. With a toll-free BBS, very reasonable rates and excellent technical help, Sonata lives up to the name *service* bureau. [Ed.: Sonata Typographers, 2490 Black Rock Turnpike, Fairfield, CT 06430, Voice: (203) 368-4559, BBS: (800) 365-5745, FAX: (203) 374-2917]

NOTE: You cannot use PageStream's Registration Marks feature without turning on the Tiling feature. You should *not* use the Registration Marks feature of PageStream unless you're aware of what Tiling will do to your document. After countless tries, and many calls to Soft-Logik's Customer Service, I gave up and created my own process.

Commercial Printing

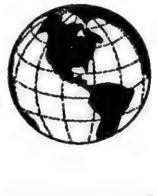
There are many printers who can do full color work, some at very reasonable prices. You should decide which printer you're going to deal with *before* printing your master pages. Your printer will have specific recommendations and requirements for what you submit. For example, some printers prefer "positive" pages, while others charge less if you supply the negatives. (Linotrons can output to photographic film or paper.) Also, your printer may require "right read, emulsion side down" or "emulsion side up" if using negatives. You'll need to give this information to your service bureau so they print your master pages correctly. Always remember to have your printer explain any terminology they use you don't understand.

Conquering the world of color desktop publishing is well worth the effort and pitfalls. Like an artist moving from charcoal sketches to oil painting, a desktop publisher opens a whole new world of possibilities by adding color to the DTP palette.

EPS Clipables

Computer Safari offers some very excellent collections of EPS clip art for PageStream users, or anyone using UltraScript.

EPS stands for Encapsulated Postscript. These are just about the highest quality graphics available. Since they are Postscript graphics, they can only be printed on a Postscript printer.



WORLD.EPS

The samples shown here are from Computer Safari's EPS Clipables Disk #1—Professional Logo Serics. These can be used as the basis for more complicated company or product logos. If you design business cards, this is one handy collection! The Professional Logo disk contains over 30 EPS graphics. The disk contains everything from artist tools to religious and education logos to graphics for a wide variety of business uses,

COMPASS

Suggested retail for EPS Clipables is only $29.95 per disk. Computer Safari, 606 W. Cross St., Woodland, CA 95695, (916) 666-1813.

Q: What's the Most Versatile Way to Print Your Documents and Text Files?

New! Version 1.1 for Command Lines!

A: **Use the Presswork's Assistant Version 1.1!**

Stop wasting time loading a wordprocessor or desktop publishing program just to print your files. The Presswork's Assistant loads quickly to give you access to the printing features you need. The intuitive **GEM** interface allows for easy control of margins, headers, page numbers, and other features--all with simple mouse-clicks. You'll never have to touch the keyboard again! Ideal for "*.DOC", "*.TXT", and "README" files, or most any quick printing job. Online **HELP** is always just a mouse-click away (GEM mode only). And now there's even a command line version for shell users--perfect for programmers and MicroEMACS users. The Presswork's Assistant version 1.1 is available now for just $10.00 (US).

The Presswork's Assistant
Available only from:

NEW
LOW PRICE
$399*

At last, a scanner with an artist's touch.

*Suggested retail price.

Here's the hardware-software graphics team you've been waiting for: the Migraph Hand Scanner and Touch-Up® for the Atari ST®.

Our scanner has everything that you expect in a good black-and-white scanner. But it comes with software you've only dreamed about. Until now.

With Migraph's powerful design team, you can produce high-resolution, monochrome scanned graphics — from start to professional finish.

Quality hardware for a strong start.

The Migraph Hand Scanner has the powerful features desktop publishers want most: A scanning window over 4" wide. Four scanning resolutions — 100, 200, true 300, and true 400 dots per inch. Adjustable contrast. Three dither settings for scanning photographs. Plus a special setting for line art.

And that's just for starters.

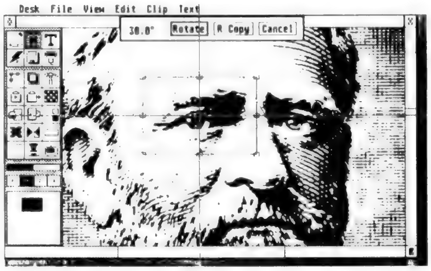
Powerful software for a dazzling finish.

Other scanners come with software that can do a few basic tasks. Our scanner comes with Migraph Touch-Up, the *complete* image editor and design tool.

Scan, edit, and enhance — even create original images. Touch-Up can do it all.

Its versatile editing functions include all the standard commands, plus powerhouse extras like rotate by degree and scan to clip area.

And Touch-Up is outfitted with a complete paint program, a full set of editing tools, and an array of special effects. It even offers scalable outline fonts in popular typefaces.



Editing features like rotate by degree give images that professional touch.

Software that just won't quit.

Size is no object for Touch-Up. It can handle images of almost any size and resolution (based on available hard-drive storage space, of course). And its editing tools — which work at all four zoom levels — extend beyond the size of the screen.

Compatibility is Touch-Up's specialty. It imports *and* exports files in IMG, Degas, PCX, and others. So Touch-Up is compatible with programs like Calamus and PageStream. And you can export images for use on the PC, Mac, and Amiga, too.

The Migraph Hand Scanner and Touch-Up: Powerful tools for professional publishing.

Our scanner is the equal of any in its class. Teamed with Touch-Up, it's in a class all its own.

See your dealer today for a great deal.

MIGRAPH™ INC

Ask about our IBM version.

For Atari 1040 ST, Mega 2, and Mega 4 systems with monochrome or color monitors (including the Moniterm monitor). Touch-Up also runs on an Atari 520 ST with 1 MB memory and a double-sided disk drive.

Design Basics for Desktop Publishers

Creating Professional Looking Headlines

Todd A. Johnson

(c)1990 Todd A. Johnson for AIM (Permission to reprint is granted provided this copyright notice is kept intact.)

How do they make those ad headlines look so professional? You've used the same typeface, even gone to the trouble and expense of having your document output on a Linotronic Imagesetter at 1270 dots per inch resolution, but that one in the glossy magazine still looks more professional. Here are some techniques that make a world of difference.

One technique used to create a spiffy looking headline is to adjust space between adjacent characters so the words become single, easily recognizable entities. The act of adjusting space between character pairs is called kerning. The amount of space between lines of text is leading (pronounced ledding.)

Kerning with Calamus

Calamus lets you kern very easily. Simply adjust the screen view so you have a good view of the headline you'd like to adjust. Plant the text cursor inbetween the two characters you are adjusting, and use the <shift> *left arrow* key to bring the right-hand character toward the left-hand one.

The space between the characters has now been reduced. You have kerned! Likewise, you can use the <shift> *right arrow* key to spread the characters apart if you feel they are too close. If you need to move in larger steps, use the <control> *arrow* keys instead of the <shift> *arrow* keys.

Closer Inspection

Let's have a look at what you are trying to achieve. As I mentioned earlier, it's important that words are easily recognized.

When words are printed out very large, the space between the letters grows by the same proportion as the letters themselves. The words can start to look more like a bunch of individual letters than a single word.

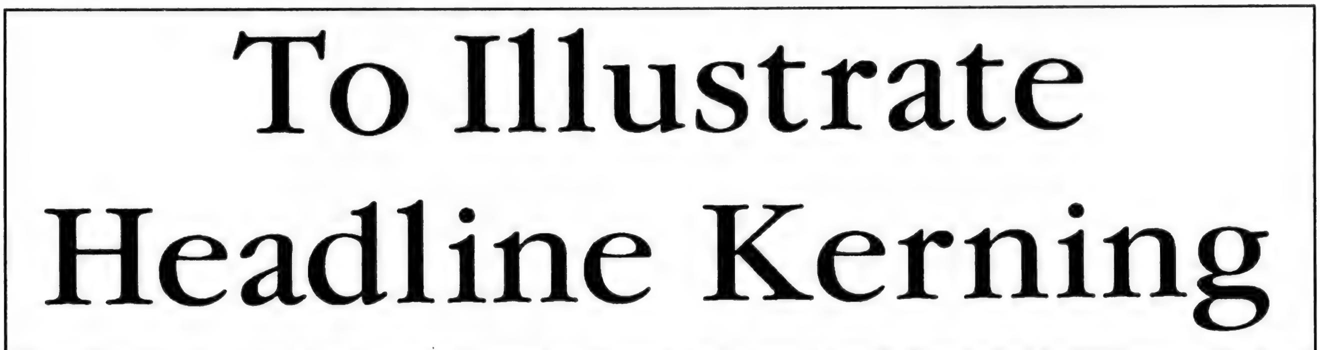
It's hard to say exactly how close the characters should be, but one simple rule is that the larger the letters, the closer they can (and should) be to each other. The ultimate goal would be to have an [optically] equal amount of white space between all character pairs within a single word.

Different character pairs need a different approach to spacing. Two lowercase "o"s, when touching, have a considerable amount of white space left above and below where they meet. Conversely, two lowercase "l"s, would have little or no white space between them if they were to touch. They would obviously require a greater distance between them to achieve our goal.

The spacing between a curved character and an adjacent straight character must again be treated differently. Splitting the difference with both of the earlier examples is usually an effective treatment.

Leading

Tight vertical spacing between the rows of text is also crucial to a professional looking headline. Too much white space will erode the unity that is necessary if the individual lines are to be considered one full sentence. Again, there is no set rule to be followed. Head-



To Illustrate
Headline Kerning

Figure One—An untreated headline set at sixty points. There is the Calamus default of two points leading between the rows of text. The character pairs are spaced as they should be for text sizes near twelve point. There is too much separation between all elements of this headline.

To Illustrate
Headline Kerning

Figure Two—The same sixty point headline, professionally kerned by Baird Advertising's Executive Art Director, Gregg Rodgers. The spacing between character pairs and adjacent words has been vastly reduced and the leading is now set to minus 10 points. The desired unity has been achieved.

lines should be set with much less leading than the smaller body text.

White Space

Choosing the appropriate type size for your headline is another item that deserves attention. The headline has to breathe. Cramming it into a confined space makes it look as though it's been crammed into a confined space.

Surround it with ample white space. The contrast brought about by doing this will more than make up for the smaller type size you may have to use to accomplish it. If you need more impact, try a bolder weight of type. Be careful when using boxes around headlines. They are rarely useful and usually infringe on the relationship between the type and the surrounding white space.

Headlines in the Real World

Take a moment and scan through some glossy magazines. Look at the full page, full color ads. You can bet these were handled by professional art directors at advertizing agencies.

These people are extremely meticulous about the spacing within their headlines. The first thing you'll discover is that often characters will not only touch, but be overlapped! This is something that should be done very cautiously. Have a reason for it (such as the lack of room.)

While you're still looking through that magazine, have a look at the article headlines. These are generally not spaced quite as tight as ad headlines. The reason is simply that ad headlines are designed to attract attention plus convey the charisma associated with the product they are selling. Article headlines are usually designed to be inviting to read but at the same time have a newsy, less flambouyant look.

Putting It All Together

There are hundreds, even thousands of kerning and leading situations that will arise. Every character pair requires a different approach and every headline will have its own challenges—both technical and artistic. Your awareness of 'white space' is the biggest step you can make towards achieving a professional looking headline. Keep your eyes peeled and apply what you learn. Before long, your headlines will take on a noticeably professional look.

[About the Author: Todd Johnson is a professional recording engineer, an avid writer, designer, desktop publisher and the proprietor of Cherry Fonts (for Calamus).]

OUTLINE® ART

Outline Art is a vector- oriented, graphic generation tool. Multiply your creativity through the many functions which you will find in this program.

Outline Art supplements the Calamus desktop publishing system with a great number of new functions and effects. An extract from the extensive list of functions include:

- A user interface, quite similar to that of CALAMUS.
- Complete Vector Graphics Editor for lines, Bezier curves, control paths etc..
- Capabilities to generate freely-definable raster areas.
- Creation of rayed objects, ie; from a font to a central point.
- Nearly unlimited possibilities for the manipulation of text, characters and text attributes such as:
    - rastered, transparent, outlined, rotated, stretched, compressed and cursive styles...
    - circular text and text along a freely-defined vector path...
    - projection of raster areas and text on vector outlines...
    - conversion of text into vector objects...
    - kerning functions...
    - Functions can be freely combined and applied to all Calamus fonts.
- Integrated, fully programable calculator with a pre-defined and extendible library of transformations such as:
    - shift, rotate, mirror, enlarge/ shrink, project onto a sphere (globe, cylinder, cone), etc..
    - An intelligent clipboard and copy functions, allowing the automatic generation of transformation sequences.
    - loading and saving in .CVG format (Calamus Vector Graphic), making possible the integration into and optimal printing through Calamus on all supported output devices in all resolutions.

Convert 2X, our new program to convert CVG (Calamus Vector Graphic) to EPS (Encapsulated PostScript®) or PS (PostScript®) file format is included with Outline Art.

Note : **DynaCADD**, our complete 2D and true 3D Computer Aided Design and Drafting Package, allows the importation of Calamus Vector Graphic format, (CVG), which can then be output through all devices supported by DynaCADD, ie: CAMM-1, Plotters etc,... An excellent solution for the Sign Making Industry.

Ask a new Calamus user to sum up the program in one word and you'd hear many of them say "complicated" or "intimidating." Ask someone who has been using the program for six months or more and you're likely to hear "powerful," "slick" and "super."

The Power of Calamus

Those comments do a good job of describing Calamus. The program has one of the toughest learning curves I've ever encountered. Once you're over that initial process, Calamus proves to be a very powerful desktop publishing package.

Picture yourself as a first-time driver. The instructor hands you a "driver's manual," leads you to a Ferarri Testarosa and tells you to hop in and take it for a spin on the Autobahn. That should give a good idea of how a new Calamus user feels.

Now, imagine what it would be like behind the wheel of that Testarosa once you're a proficient driver. That gives you a good idea how an experienced Calamus user feels.

When I first started using Calamus, I was struggling. The user interface, with its multi-layered icon approach, seemed cumbersome and unintuitive. With the help of the supplied 36-page tutorial, I picked up the bare essentials necessary for using the package.

But, that was about as far as I could get. I found the manual a bit hard to follow at times, as well. The lack of an index didn't help. (The manual's index was printed in the separate tutorial booklet.)

To the Rescue

Then, ISD came out with *The Guide to Calamus Desktop Publishing*. This book, available only to registered Calamus owners, was a godsend!

Well written, informative and organized quite differently from the manual, this book was a big help. The book has sections dealing with Calamus, the Calamus Font Editor and Calamus Outline Art. There's even a chapter for users totally unfamiliar with GEM. And, yes, there's an index!

After nearly eight months of using Calamus and putting it through its paces, I've become very comfortable with the whole package—user interface, manual and all.

I'm still not what I'd call an "expert" Calamus user. I'm much more at home in PageStream, but there are times when I'll turn to Calamus instead. When Calamus is upgraded to Calamus SL and can do full-color work, I may switch to preferring Calamus.

Calamus Output

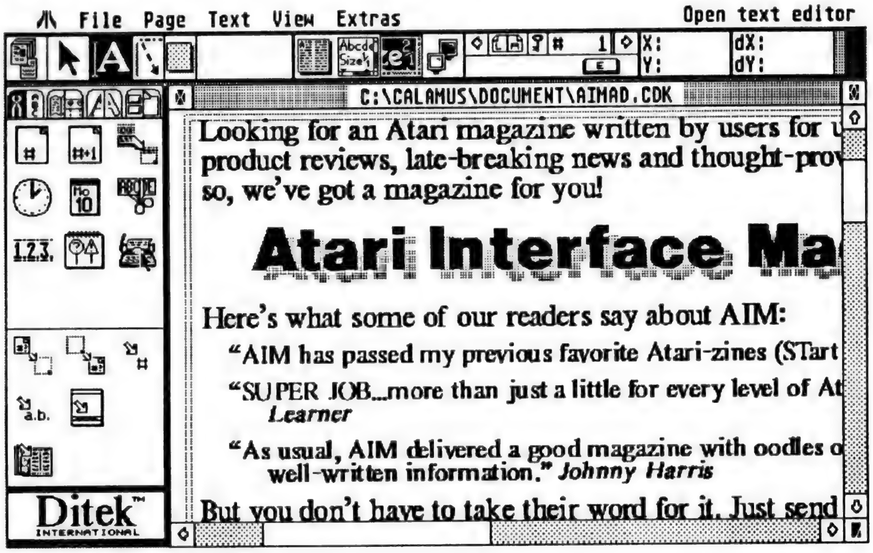
With all that said, let's get on to the program itself!

Calamus is, without question, the most advanced desktop publishing package available on the Atari ST. Anyone in the market for a complete page design system should seriously look at this software.

This power, however, does have a price. Besides the patience to get over the tough learning curve, you'll need at least two megs of memory.

If you're using an Atari SLM-804 laser, a four meg machine is practically a necessity. (Anyone publishing anything larger than one-page flyers should have at least two megs of memory, no matter what software is used!)

If you've heard about Calamus but never used it, you've probably heard it has an outstanding screen



Looking for an Atari magazine written by users for u
product reviews, late-breaking news and thought-prov
so, we've got a magazine for you!

Atari Interface Ma

Here's what some of our readers say about AIM:

"AIM has passed my previous favorite Atari-zines (STart

"SUPER JOB...more than just a little for every level of At
Learner

"As usual, AIM delivered a good magazine with oodles o
well-written information." *Johnny Harris*

But you don't have to take their word for it. Just send display. Calamus vector fonts give about the truest "what you see is what you get" display possible. One of the viewing modes gives you exact 1:1 screen to printer display ratio.

Calamus beats the competition hands down here, with smoother screen display and redraw.

Speaking of fonts, ISD markets a complete line of Compugraphic fonts for Calamus. These fonts are just about the highest quality you can get anywhere.

When I worked for a book publisher, we used Compugraphic fonts on our publishing mainframe—at $400 a disk! These fonts cost around $79 to $99 from ISD; quite a bargain if you need the extra professional touch these fonts can give.

There are also some very good third-party fonts available from M-S Designs and Cherry Fonts. Calamus ships with only variations of Times and Swiss (Helvetica).

The output from Calamus on a standard HP Laserjet II is the best I've seen from any desktop publishing package, rivaling Postscript output. Calamus supports most 9-pin and 24-pin printers, as well as the HP Laserjet and Deskjet series and Atari's laser. Calamus falls short when it comes to supporting Postscript. You cannot print directly from Calamus to a Postscript printer such as a QMS laser. There are, however, a few service bureaus that accept Calamus files directly and print them on high-end typesetters. ISD itself offers to "lino" your files for a reasonable fee.

There's a Word Processor in Here!

One of the nicest features of Calamus is its Text Editor mode. With most DTP packages, users go to great lengths to avoid typing text directly into a frame. That's because most packages respond sluggishly to typed in text and are *painfully* slow at screen redraws.

Calamus solves this problem by incorporating a full-speed-ahead text editor that works like a mini-word processor. You can actually enter your text, along with DTP formatting codes, from within Calamus without wincing.

The text editor allows you to copy text from a frame into the editor and flow text from the editor to a frame, so editing those pesky missed typos is a breeze. From the editor, you can access the Edit Style dialog, where you can set font, point size, attributes and text color (black or white only until Calamus SL).

You can define blocks of text and manipulate them while in the editor as well. In all, the text editor is quite useful. I wish the other DTP packages I use—PageStream and Ventura—had this feature!

Text Features

Along with the standard ability to set text bold, italic, underlined, shadowed, and various other attributes, Calamus gives you a few other options. Since most other DTP programs also support these options, I'll only mention a couple that most others do not. At least, not quite the same way.

Cherry Fonts for Calamus

Professional-looking fonts can make a world of difference in your documents. Whether you're printing your pages on a 9-pin dot matrix printer or a phototypesetter, Cherry Fonts will "add some of that designer touch to your Calamus documents."

Here are a few samples of the excellent fonts available from Cherry Fonts:

Port Coquitlam, BC, Canada V3C 2Z1
(604) 944-2923

You can rotate text in Calamus. But, first you have to place the text in a "Rotated Text" frame. Calamus is very picky about this kind of thing, and there's a different type of frame for everything in this program...a vector graphics frame, a raster graphics frame, a normal text frame, a rotated text frame, a footnote text frame, etc. When first starting out, that's one of the frustrations of the package for anyone who has had DTP experience with some other program.

The DMC programmers didn't just create all these different frame requirements simply to frustrate Calamus users. There are some very nice benefits to this approach. With rotated text, the benefit is this: Whenever you are in "text mode," the rotated text "unrotates." This allows you to easily read and edit the text. As soon as you leave text mode, the frame automatically re-rotates. Pretty nice!

As a shortcut, you can simply select the rotated (or any text) frame and hit Alt-E. This puts you into the text editor, allowing you to make changes without unrotating the frame.

Another nice touch is the way Calamus allows you to not only change the fill patterns and gray-scaling on text, but also on the text's shadow. In fact, Calamus gives you about as much control over how and where a shadow falls as it does over the text itself! The shadow features aren't limited to text only, either. You can do the same thing with lines and geometric objects. This may seem like a pretty small detail to you, and it is. The fact that Calamus gives you this kind of minute control here is indicative of how much power is available to you throughout.

Rulers

To set left and right margins, paragraph indents, tabs, line spacing, justification and spacing between paragraphs, Calamus uses what is called a "ruler line." By selecting appropriate icons and clicking on a ruler line, you set the desired option. You can also select a block of text and define a ruler line setting to affect only that block. Calamus inserts a ruler at the start of the text using your special settings and places a ruler with the previous settings after the text block.

At first, the use of rulers was a bit confusing to me. But, I quickly caught on with a little trial and error. If you really mess up, the "Delete Ruler Line" icon makes cleaning it up easy.

There's even a special clipboard for ruler lines! You can store a frequently used ruler line in the clipboard and later insert it into your text.

Hyphenation

The way Calamus handles hyphenation is quite nice. A Hyphenation Exception Dictionary stores, as you might guess, hyphenation exceptions. You can save multiple dictionaries, allowing you to create specialized technical dictionaries. You can search for a specific word in the dictionary and add or delete words.

Fonts from M-S Designs

If you need a Calamus font that's a little out of the ordinary, eyecatching or just plain fun, M-S has just what you need.

With eight different Font Groups from which to choose, you're sure to find a font that's just right for your special needs. And at $39.95 per Group, they won't break your bank account. You can even buy all eight groups for only $150!

M-S Designs can be contacted via mail at 611 W. Illinois, Urbana, IL 61801 or by voice at (217) 384-8469.

Take a look at what M-S Designs has to offer:

Calamus differentiates between normal hyphens and hyphens between parts of a compound word. It's preferable to hyphenate compound words between the individual parts, and Calamus is smart enough to know the difference!

In the same icon submenu as the dictionary items, you can set auto-hyphenation during import of text. This will hyphenate incoming text automatically.

Graphics

Like any good desktop publishing software, Calamus allows for importation of graphic objects. Unlike most others, the program differentiates between vector and raster graphics.

Vector graphics refers to GEM graphics, which are built up from many tiny objects that retain their individual properties. Programs like Migraph's Easy Draw can create such graphics, and Migraph sells a very nice set of these in their DrawArt package. ISD also offers GEM clip art disks for only $49.95 each. The three disks currently available total over 1,000 graphics!

The special Vector Graphic Frames have an "Ideal Size" feature. Using this feature automatically sets the graphic to the best vertical to horizontal ratio within the frame.

Raster graphics are more what we think of when discussing clip art. These are scanned or bitmapped images, such as IMG files produced by Migraph's Touch-Up or WizWork's MultiViewer Graphica. This group also includes DEGAS pictures.

Raster Graphic Frames also have a few special features. You can have Calamus "optimize" the graphic's size for the printer you're using or for the screen. Selecting "Optimize to Integral Enlargement" will do for raster graphics what the "Ideal Size" option does for vector graphics.

Head to head on a standard HP Laserjet II, output of graphics from Calamus seems to have the same edge over the competitors as in text output.

Clip, Clip

Calamus has five text and five frame clipboards! Basically, these function in the same way. For example, you can copy text to one text clipboard. Then, you can copy more text to another clipboard without affecting what's in the first one. You can move or copy to a clipboard and copy or delete from a clipboard.

These clipboards can be very handy for moving text or graphics from one document to another, or somewhere else in the current document.

Physical vs. Virtual

When copying frames, you can make a physical or virtual copy. Making a physical copy is the way most software works. The new copy is an exact duplicate of the original, but it is totally independent from its "parent."

A virtual copy is something quite different. It looks the same as a physical copy. However, if you later make a change to the parent, all virtual copies automatically change to match. Not only can this save you a lot of time, it saves memory as well!

Macros

One of the most important features found in Calamus, in my opinion, is its ability to define macros. Macros are nothing new to DTP packages, but they are often overlooked or ignored by users. In Calamus, these macros make it easy to bypass many complex procedures. You can use macros to set text styles, define special characters or combine multiple commands into one keystroke.

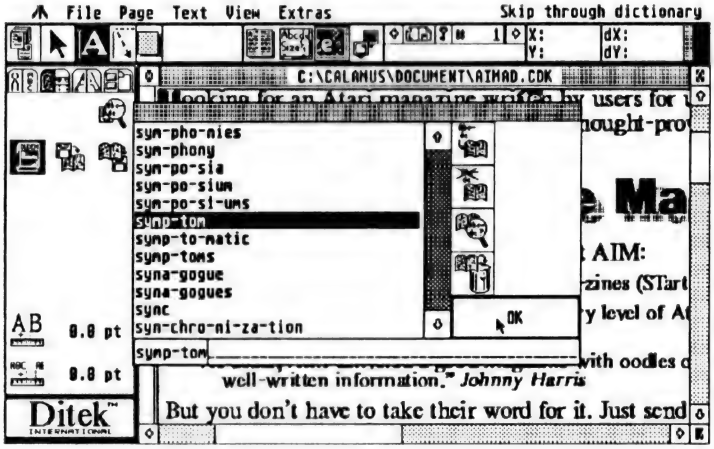
You can define 22 macros per "macro list," and you can save/load macros at any time. This allows you to set up custom macros for individual jobs, or to define more than the 22 limit. With most other DTP packages, this isn't possible.

Calamus also comes with a multitude of predefined keyboard equivalents. You can redefine these "hotkeys" to suit your own taste.

I highly recommend that anyone learning to use or struggling with Calamus take the time to get familiar with Calamus macros.

Miscellaneous Neat-o Features

There's lots more to Calamus I haven't mentioned, like Index and Footnote frames. These can really help



```
sym-pho-nies

sym-po-sia
sym-po-sium
sym-po-si-ums
symp-tom
symp-to-matic
symp-toms
syna-gogue
syna-gogues
sync
syn-chro-ni-za-tion
```

symp-tom

in technical book and manuscript publishing. Although I've only played with these features, it's nice to know they're there if I ever need them. With Calamus, adding footnotes or an index to a document isn't a major hassle.

If you ever need to refer your reader to something on a preceding or following page, Calamus has a handy "page reference" feature that's just for you.

Finally, there are what I call "cursor sensitive help messages" that appear in the top right corner of the Calamus screen. These short messages give information concerning the icons and other Calamus features. You can edit them to suit your own needs if you wish.

Having only scratched the surface of what Calamus can do, I think you can see just how powerful this package is. It is definitely a strong contender for best overall package in the desktop publishing market. When combined with Calamus Outline Art, you have one killer DTP setup!

The upcoming Calamus SL adds even more features. Most importantly, it can do full-color DTP! SL's "modular approach allows later addition of enhancements. Other features include paragraph tagging, horizontal and vertical text balancing and the ability to have up to seven windows open at once!

ISD's support, both voice and online on GEnie and CompuServe, is second to none. Demo versions of Calamus and Outline Art are also available online or directly from ISD if you want to take these babies for a test drive.

** ** **Introducing the GOOD Backup Utility** ** **

GOOD
Backup
Utility

Specially designed for keeping complete backups of your hard disk partitions.
Backup disks are TOS compatible.
Intelligent Updates!
Update your backup every day! Only new & modified files are copied, and the old files are deleted to make room. As good as an image - but done in less time.
Great for use with Cartridge Disk Drives

All this for only:
$29.95
Suggested Retail Price,
(in massachusetts add sales tax)

Tid bit
Tidbit Software Engineering Company
25 Wood Lane, Maynard MA 01754
Telephone (508) 897-7429

Features of the GOOD Backup Utility:

- Copies data from a selected active disk partition to a pile of ordinary TOS readable backup disks.
- A backup can be interrupted before it is done, to be completed later.
- You can keep your backup saveset on floppy disks, removable cartridge drives, or keep a shadow partition on another hard disk unit.
- No folder limit on backup or restore.
- Any file that cannot be fit on a single saveset disk will be split up across as many as needed.
- Updates to the backup will only copy the files that have actually changed. If you update your backup frequently, the update goes very quickly.
- The GOOD Backup Utility can format floppy disks for you as additional disks are needed.
- Lost or damaged disks in the backup saveset can be replaced without replacing the entire backup saveset.
- Checksums are used to verify that the files on the active disk drive and on the backup disks are all intact.
- Write back disk cache technology is used to make all the copying go fast.
- Backup can be by partition, or select specific files by including or excluding a set of wildcard file specifications.
- Files can be restored as an entire partition, or by wildcard selection. When restoring an entire partition, only files that are actually missing need to be restored.
- A reference list can be produced for locating individual files within the backup saveset.

Pressing the HELP key will provide additional information at every step.

If your dealer doesn't have the GOOD Backup Utility, you can order it from the Computer Bug, 113 Russel St., Hadley, MA, 01035 (413) 584-7722

REV UP YOUR ST

Discover maximum driving pleasure with Alpha Systems products. Software and hardware known for high marks in gutsy technology, understandable documentation and, yes, super, low prices.

NEW!

BACK TRAK UNLEASHES DOUBLE-SIDED DISK DRIVES

New *Back Trak* software gives ST users more — for less.

Double-sided drives are now standard equipment on all ST computers, but software companies continue to churn out programs on single-sided disks. For those of you with double-sided disk drives, it means wasting 50% of your disk's capacity! With blank disks costing up to $5 each, you waste dollars every time you buy a program or make a back-up!

Back Trak allows access to backside of single-sided disks, **doubling your storage capacity.** Use new found space for files, saved games, even boot (self-loading) programs. *Back Trak* lets you boot off front or backside of disk. And, allows booting from drive A or B. (Booting from drive B proves invaluable if your internal drive ever breaks down.)

Fully compatible with copy protection programs like *ST Copy, Copy II ST* and *ProCopy, Back Trak* even lets you put protected programs on the backside of your disk. For example, save games on backside of *Dungeon Master* — then switch back and forth instantly without swapping disks. Or, save a two-disk set on a single disk.

Every time you use *Back Trak*, you save time and money. And, you'll see less wear and tear on drive heads as you utilize your double-sided drive's full potential.

With this pure software program, there are no special connectors to fool with. No cables to cut.

Only $29.95

COLOR COMPUTEREYES™

Capture your picture, or your favorite star's, with the first and only full-color video digitizer for the ST!

Color ComputerEyes uses any standard video input — video camera, VCR or video disk. Works in all ST resolutions. Low resolution provides 16-shade black & white or full-color pictures. Features automatic calibration of contrast, brightness and white balance.

Pictures can be used with *PowerPrint II, Degas, Neochrome* and others. Plugs into cartridge port for easy setup.

Only $199.95

POWERPRINT II

NEW FEATURES:

- NOW SUPPORTS SPECTRUM PICTURES
- THREE POWERFUL WAYS TO PRINT ".IMG" FILES

Power Print

Create picture-perfect banners, posters, wall-size business graphs and more! *PowerPrint II* makes it easy, with unequaled clarity and resolution.

Zoom option lets you blow up small portion of image. Mirroring is great for T-shirt iron-ons. You can also reverse shades in printed image so blacks become whites and vice-versa — just like a photo negative. Image can be rotated 90° to print up and down or across the page.

Print 16 shades for incredible detail. Selective shading allows you to print multi-color pictures by printing one color at a time with color ribbons.

PowerPrint II lets you capture and print almost any ST screen. Works with *Star, NEC, Citoh, Gemini, EPSON, XM8048* and compatible printers.

Only $39.95

DIGISPEC

Get a feeling of creative power with the ultimate in computer video digitizing. Simply capture an image with your *Color ComputerEyes* and color video camera (or VCR, video disk, etc.). Then run *Digispec*. Watch your picture develop into a spectacular image of up to **512 different colors!**

Low resolution brings out detail in backgrounds and faces for highest quality image possible. Clarity is unsurpassed. Shading feature uses technique called dithering to create and display images in up to **24,389 simulated colors!**

Only $39.95

PROFESSIONAL VIDEO SYSTEM

Everything you need to capture full-color video images and print them with professional quality on your ST. Comes complete with *Color ComputerEyes, PowerPrint II* and *Digispec*.

Only $249.95

ST PROTECTION TECHNIQUES (Book/Disk Set)

Only $39.95

Everything you always wanted to know about protection schemes and state-of-the-art in copy protection.

Includes software disk with *Automatic Program Protector*. Lets you create custom disk formats and check them automatically. Learn how to specify password requirements, disk checks, and set limits on number of program runs.

Also contains reviews of popular ST back-up programs and detailed explanation of ST disks and drives.

Glendale Show Report

Gary Klugman (SVACE)

The four-engine English commuter jet that I was flying in started its descent toward Burbank airport.

Normally, I wouldn't have looked up from my isle seat. This time I did, only to see us descending into the brown smog haze held in by the mountains surrounding the San Fernando Valley.

Knowing the quality control common to English manufacturers, I wondered if the jet could really fly into this muck. I took comfort in the fact that the small jet had four engines. That's probably the English way of making sure the plane will make it from one place to another without crashing. With four engines, you have at least a couple to spare.

I also took comfort in knowing that if we landed safely, I would be in Atari-land, the Glendale Show.

Actually the Glendale show is more formally called the Southern California Atari Faire, version 4.0b. It was cancelled last year due to a conflict in show scheduling. If it hadn't been cancelled last year this would have been the fifth consecutive show.

This show was sponsored by the HACKS Atari Computer Club with John King Tarpinian chairing the show. John is an amiable, enthusiastic, capable and camera shy Atari user.

All show attendees passed under the black Jolly Roger. This one had the skull and crossbones with the universal 'No' symbol over it. The message was clear to everyone, even an English jet mechanic. Software pirates were not welcome at this show.

The Glendale auditorium worked out fine for the show. It was obviously built to have stage shows on the main floor. The floor that would ordinarily seat the audience held the exhibitors. Above the floor was the stage. It held Atari Corporation's exhibits.

Jimmy Hotz

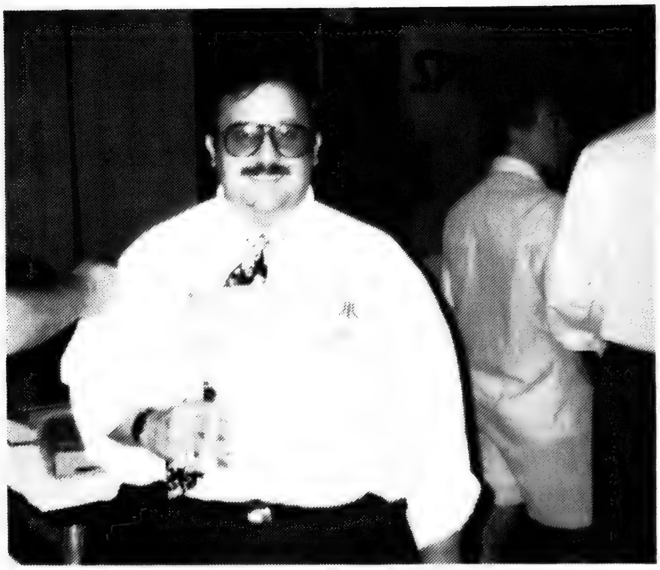
The basement was apparently a disco arrangement with step-down dance floor surrounded by a rail. The seminars were held there, with the audience seated on the dance floor and the speakers at a podium above the dance floor.

At the Atari display, Jimmy Hotz demonstrated the Hotz box. Jimmy is as comfortable with music as he is with English. He found it difficult to describe the Hotz Box without using it.

Since my experience in music rests with turning on a radio, I found it difficult to understand Jimmy. After watching him and reviewing my taped interview, I can tell you the Hotz Box is an extremely touch sensitive, membrane board that does not create its own sound.

Rather, it uses different sound sources to create new sounds that might not be otherwise possible. There are two models now available—one that retails for $5,500 and another for $3,300. There will also be software available for it for around $200.

The pricing makes it geared to the professional musician, but



John Tarpinian

Jimmy would like to see models available for the mass market. It was amazing to hear the sounds Jimmy could create with a membrane keyboard. We've come a long ways from the Atari 400 keyboard.

Dave Small gave one of his usual fine seminars. If you haven't heard one, don't miss the opportunity. I walked in late to a full audience. I could hear Dave's voice but couldn't see him. I knew this couldn't be a taped talk. I looked around the lectern and the front tables. No Dave Small standing, sitting or otherwise visible.

OK, well everyone else is seated there, so I'll come in and sit down too. There's Dave! He is sitting on the stairs going up to the lectern. He is sitting below his audience. He is talking about his can of diet soda again—same subject as the Anaheim World of Atari. And the audience is spellbound.

Abu Zubair with Z-scan

He also spoke about the Spectre GCR's increased compatibility with Macintosh hardware/software, the 68030 turbo board and computer programmer's pallor. His bent techie humor captured the audience as he gave out real information.

Zubair Interfaces was showing their Z-Scan, which is a Logitech scanner. They will sell the software with or without the scanner. The software is a German import called ReproStudio. ReproStudio will handle up to 32 grey scales. It has many image manipulation features, as well as different save formats.

It was not available at the show. When the package is ready to ship, it is expected to retail for under $400 with the Logitech scanner and under $200 without. Abu Zubair expects to start selling it at the October WAACE show. They also have a German IBM 286 board they expect to ship in October. It has a Norton factor of 6.7. It will do CGA and Hercules Graphics and runs all the popular 286 software. It is a compact internal board about 3" by 2". It is expected to have a suggested retail of $355.

John Townsend (back) and Ken Badertsher (far left) at the Beckemeyer Booth

Talon Technologies was showing their new software enhancement for the SuperCharger external IBM emulator. They can now run SuperCharger as a desk accessory from the GEM desktop.

This allows true multitasking because the SuperCharger has its own microprocessor and RAM. I watched as the SuperCharger was run as an accessory, and a GW-Basic counting program was run. We returned to ST mode, moved some files around and then went back to the DOS accessory. The counting program was still running and obviously had been running while we were in GEM.

ICD was showing their AdSpeed accelerator. It is a 16 MHz board that switches between 16 and 8 MHz on the fly. You need to have a socket installed for the 68000 CPU to put in the accelerator. After that, there are no wires to attach. ICD says AdSpeed does not have mouse, I/O or blitter conflicts. It has its own on-board high speed cache memory.

Software Development Systems was showing DATADESK. At the time of the show, owner Scott Sanders thought it would be two weeks from shipping. It is a complete home entertainment management system.

It catalogs CDs, DATs, albums, singles, VCR tapes, cassettes 8-tracks and sheet music. It does this by creating its own desktop with icon images for each subject. The user is able to add a module editor, recipe filer, comic book cataloger and stamp collector. Software Development Systems will, or has by the time you read this, come out with Deskjet Utilities, a telecommunication program and a bulletin board system.

In addition to their other fine software, CodeHead Software introduced CodeKeys, an easy-to-use and flexible macro utility. The user can record key presses and mouse movements, even the time between key presses. It can be used inside of GEM or TOS programs.

This program is especially useful for redundant keyboard sequences that we all do. An additional interesting option is that it will record a macro from within a macro. It holds sets of 32 macros, and allows the user to use any key or combination of keys to call up a macro. You can even have it run periodically, so you can do things like save your work.

Other Goodies

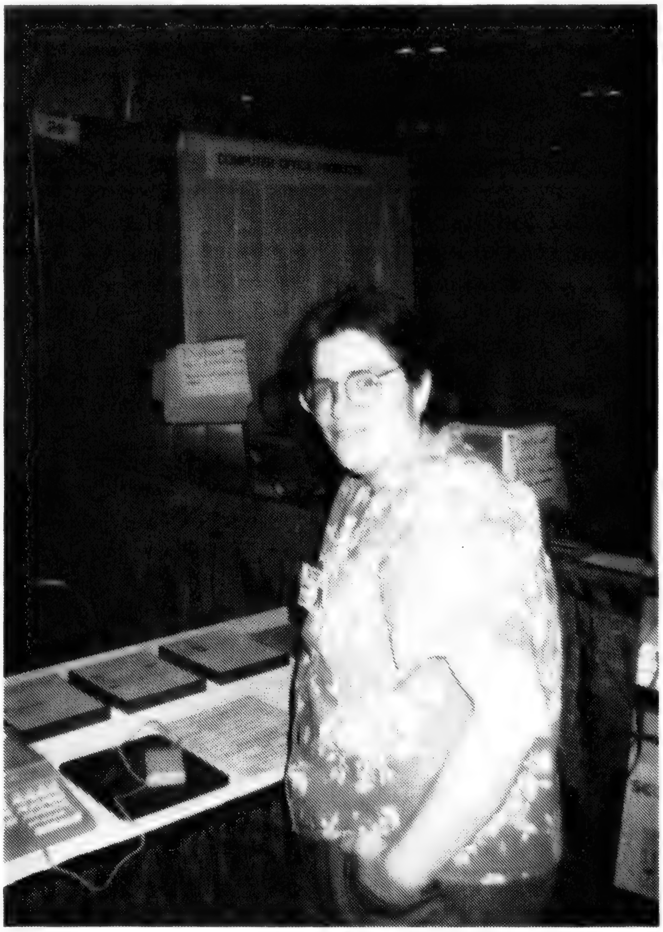
Michtron had their 286-based MS-DOS emulator board for the ST. They also had Fast FAX, an ST add-on that can send and receive FAXes. Goldleaf updated Wordflair—it is now smaller, faster and has improved display and WYSIWYG printing. It also has keyboard shortcuts and can import more graphic formats. Branch Always had an updated Quick ST II and Double Click updated their DC Desktop.

SliccTop by Sliccware, a very different (and multitasking) approach to the desktop, was on display. Xoterix had a 20 meg hard drive for the Portfolio. Sprockets showed their hardware to allow 520/1040 users to attach a Mega keyboard. They also have nice cases for the Lynx, Portfolio and Stacy.

Leonard Tramiel spent Saturday at the show. He spoke at a couple of the conferences. I found his approach somewhat smug and sarcastic. This was a definite improvement over his demeanor at the San Jose WOA. At any rate, his appearance was appreciated.

Ken Badertscher, John Townsend and Bob Brodie

Lynx Display at the Show



KidPrgs Author Dorothy Brumleve

also spoke. Most of the questions were about the TT. I don't have any revelations about it, other than a 32 MHz TT that is highly ST compatible will be introduced at COMDEX.

Atari has signed up a new distributer of computers called the ASKEY Group. The 400 retail outlets are not called ASKEY. The dealer might be called Joe's Computers, but it is affiliated with the ASKEY Group.

Atari's Elie Kenan held meetings with developers all day Saturday. He had a private room and developers were ushered in and out. My impression was that the developers were impressed by him. They also felt it was refreshing to have a high official at Atari genuinely interested in them.

What better place to meet a large number of developers than at one of these shows?

We didn't get the Saturday morning crush of people that is usual for these events. Usually, you can't get close to a booth without waiting in line until Saturday afternoon. At this show, you could get to a booth with only a short wait, if at all. The crowd was steady all day Saturday and steady, but lighter, on Sunday.

Attendance probably reflected the actual number of people actively using the Atari computer in the area. Vendors seemed happy with the show. They were also generally unhappy with the sales of Atari peripherals and software over the past year.

Overall, I learned a lot, thoroughly enjoyed myself, spent too much money and will make a special effort to go again next year.

An 8-Bitter's Look at the Glendale Show

Lonnie Allen (LACE)

I've had my 8-bit Atari for two years, and my only complaint is...no support. (Okay, when I bought it, I knew that would be the case.)

When I got to the show, I found it to be smaller than I had imagined it would be. I started to look around to see if there were any 8-bit booths, and I found a computer club's table. All it had was a public domain copying service. That's cool...I looked it over, but as you know, PD is just PD—no thrills.

So on I went from booth to booth looking for 8-bit support, and all the major software companies had no 8-bit things to offer. Then I saw it. The Best Electronics booth—8-bit game cartridges, books, joysticks, trackballs and a lot of other parts for 8-bits and STs. That booth was packed with good stuff and people were all over it. My hat is off to Best Electronics for their great support, especially to the man who cares to please his customers. Their satisfaction is his best asset.

That's how I saw the 8-bit side—very slim. It made me take a step back and look real hard at my XE. Is it worth it? For now, yes. But the ST is a fine-looking piece of equipment.

The Hotz Box

The main thing that caught my eye was the Hotz MIDI Translator!!! This display was on a stage surrounded by the Stacy 4, Portfolio and the new STE—all fine looking machines, but you've probably heard a lot on all of those.

The Hotz was demoed by its inventor, Jimmy Hotz. I stood in amazement at the fantastic sound quality coming out of an Atari computer with the translator. It was great! It made me wish I had an ST and the money to buy a Hotz Translator.

This machine can be used as a learning tool. Its most amazing aspect is that it doesn't allow the player to play a wrong note (out of key, scale or chord). Special modes can be customized for writing songs, performing, sound effects, teaching and recording.

The translator can be as simple or as complex as the user desires. About thirty screens are involved. Together, they create a very flexible, powerful and truly intelligent controller. The only limit is the quality of the sound modules used.

Imagine what this means to musicians as well as non-musicians. Non-musicians can sound great the first time they play with the magic box. Music can now be more fun for the young and old, as well as the handicapped.

Well, that's an 8-bitter's look at the Glendale Show. After this long, hard look at the 8-bit support, I purchased a 520 ST within two weeks after returning from the show.

The Hotz Box

NeoDesk™ 3 is a complete replacement of the boring, built-in desktop that comes with the Atari ST. Its advanced, yet intuitive, graphical interface will make your computer both easier to use and much more powerful.

It is the easiest and most affordable way to realize your Atari's true potential. Many have called it "the ultimate upgrade for the Atari ST".

NeoDesk introduced the idea of placing your commonly used programs directly on the desktop while pioneering the concept of assigning different custom icons for individual files and folders.

Now NeoDesk 3 takes you a step further, introducing several new and original concepts which will make you want to scream "I want my NeoDesk 3!".

In addition to keeping commonly used files and programs on the desktop, you can now also keep folders on the desktop. And not to limit your creativity, with NeoDesk 3 you can even write *Desktop Notes*™ right on the desktop itself.

Only NeoDesk 3 allows you to look at two different parts of the same window, thanks to its amazing *Split Window* feature. Of course, each window can be set to display text or icons, independently of any other window. Each window can even have its own sorting and text options.

NeoDesk is also smart, using all of its available memory for file copying so that as many files and folders that will fit into memory are read in at once. No more useless disk swaps, even hard drives benefit from its speed and efficiency.

Add some of the other NeoDesk 3 features, such as a brand new Icon Editor, keyboard equivalents, desktop picture, file templates, *Active Icons*, and *Hot Keys* (execute your favorite program with a single key), then you have more than enough reasons to buy NeoDesk. But for those of you who need a little more, read on.

NeoDesk 3 now offers a unique *File Clipboard*™ which lets you temporarily hold files and folders in memory while you are busy doing other things. In a way, you can think of it as an automatically expanding and shrinking ramdisk.

You now also have the power of *Macros*, with which you can automate any series of desktop operations like opening windows, copying files, running programs, etc. These can also have *Hot Keys* assigned to them.

NeoDesk 3 even has special support for 5 1/4″ floppy drives and formats all disks with the correct information so they work on most MS-DOS computers.

From low resolution to ultra high resolution, NeoDesk 3 supports up to 10 different resolutions in each system.

Of course, these features would not be useful unless they were easy to use. Rest assured, NeoDesk 3 has been designed to be "upwardly compatible". Use NeoDesk just like you used the original desktop, no need to forget all that you have learned.

It doesn't stop there. The included *Recoverable Trashcan* lets you recover files deleted with it at any time in the future. It was created using the *NeoDesk Developer's Kit*, which opens a whole new world of possibilities. There's also the *NeoDesk CLI* (both available separately), a complete window based command line interpreter which allows you to create pop-up menus, automate file operations, and much more.

No matter who you are, NeoDesk 3 has something for you. From helpful search capabilities to a powerful file reorder function. Thanks to its ability to remove itself from memory, it only needs about 35K of memory. Of course, there's lots more, which you can discover by ordering today!

NeoDesk 3 and the NeoDesk CLI are available from your local dealer, or order toll free by calling (800) 284-GRIB and get FREE 2nd Day Air (US only). Call or write for upgrade and other information.

WAACE DC AtariFest

Joe Mirando (CCCC)

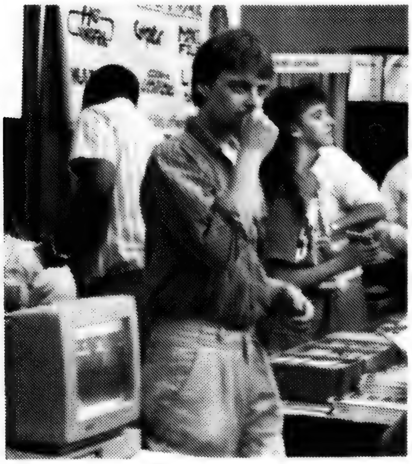
I have often heard people say "Everyone who is anyone was there," and wondered if it was just a figure of speech or a way of making one's self seem important to whoever was listening. After the WAACE DC AtariFest, I can honestly say I'll never think about that phrase the same way.

While it may not be true that *everyone* was there, most of the major names in software and hardware were well represented.

Because of the sheer magnitude of this show, as well as a schedule limited by Amtrack's arrival and departure times, I'm afraid I missed not only most of the seminars given on popular aspects of ST computing, but also some of the vendors and developers. The following is a short overview of what I was able to see.

Gribnif Software

Dan Wilga, Rick Flashman and Tricia Metcalf were busily showing off the latest version of Neodesk (3.01). If you haven't seen this program, you are doing yourself and your ST a gross disservice.



Dan Wilga

It replaces the built-in desktop with a multitude of functions that can be called by using either the mouse or convenient key combinations. It also adds functions not available in the original desktop such as a printer queue, recoverable trashcan, custom icons, custom fonts, graphics and text windows on the same screen, multiple templates as well as many other features.

Double Click Software

Double Click also acquired a crowd by showing off their entry in the desktop category, DC Desktop. DC Desktop does not replace, but augments, the existing ST desktop with many new features.

One of the nicest features of DC Desktop is the ability to not load portions you have no need for. This saves memory and also affords a measure of expandability (just add new modules as you want or need them). It also insures that you don't have to buy a whole new version of the program just to get a few new features.

These are just a few of DC Desktop's features: Custom icons for programs and drives, the ability to view picture files just by clicking (double clicking, that is) on the file, a show option for text files that allows scrolling and paging up and down through text, an arc utility that allows you to view or extract from an arc, cabinets that allow you to group programs together for easy access no matter what drive or folder they are actually in, and you can also boot-up with the desktop picture of your choosing.

Mike Vederman

As much as by the abilities of this program, I was impressed by the enthusiasm of Double Click's Mike Vederman.

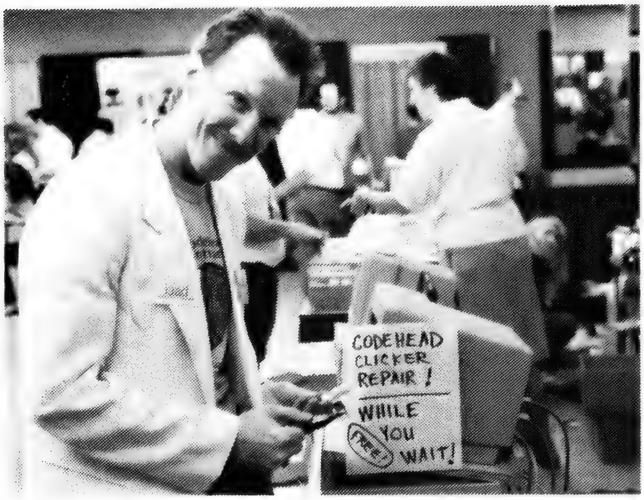
As he was showing me the multitude of features packed into this package, I could tell he was proud and excited about it. Every time I thought the demo was over and started to say "thanks," he would smile and say "But wait, that's not all! Watch this." He would then proceed to show me yet another feature.

Keep up the good work and the good attitudes, guys.

CodeHead Software

The inimitable CodeHeads arrived bearing their offerings: CodeKeys, G+Plus, HotWire, MultiDesk, MaxiFile, MIDIMAX, Look-It, PopIt and CodeHead Utilities. Because the CodeHeads are well known for their utilities, I'll only cover some of their programs here.

MultiDesk lets you load more desk accessories than the GEM



John Eidsvoog

limit. MultiDesk is itself a desk accessory. Its function is to load other desk accessories into itself. By loading MultiDesk into itself, and then loading other accessories into these sub-MultiDesks, you can load as many accessories as memory allows.

HotWire allows you to assign keyboard combinations to call up programs. This means you don't have to go hunting through drives and folders to find and run a program. All you have to do with HotWire is use the key combinations that you yourself have decided on for each program.

LookIt offers the ability to view ASCII files using the mouse or keyboard with fast, flexible search features along with the ability to edit binary files in Hex or ASCII. PopIt, essentially, allows you to "HotWire" your desk accessories.

Aside from being ingenious, the CodeHeads, C.F. Johnson and John Eidsvoog are fun-loving, personable folk. After seeing several children walk past with the 'clicker' favors given out by Double Click Software, Mr. Eidsvoog put a sign on the side of their computer monitor that read: *"Codehead Clicker Repair! Free While You Wait!"* To Charles and John, I can only say "Keep it coming!"

Branch Always Software

Branch Always Software had a new version (2.2) of their software accelerator, Quick ST. This version offers an even greater speed increase than earlier versions. Among the files included in the package is an accessory to change the default options of the accelerator itself and a utility to test the performance of your machine as compared to a "stock" ST.

Darek Mihocka of Branch Always Software said although he had plans for a version of Quick ST optimized for the new Atari TT, they do not yet have a TT to begin working with. If their past performance is any indication, we can expect great things in the future from Branch Always.

D.A. Brumleve

D.A. Brumleve's kidprgs showed that you're never too young to use a computer. The three programs demoed—Kidpainter, Super Kidgrid and Kidpublisher Professional—showed intelligence, forethought and an uncommon understanding of what kids (ages 3 to 11) need in order to grow into computer-literate young adults.

KidPainter is an art program with easy-to-use options allowing you or your child to create anything from paper dolls to coloring books.

Super Kidgrid allows your child to build creative thinking skills through the creation or modification of designs that can be turned into color-by-number pictures in fourteen colors.

Kidpublisher Professional is just what it sounds like—a publishing program for kids. It can be used to make posters, storybooks or anything else your child can dream up. Although the options in Kidpublisher are simplified for children, they are designed to get kids ready for grown-up word processors and publishing programs.

Watching several kids play with these programs, I noticed it was an adventure for them. To parents and teachers: This is education. But don't tell your kids; they think it's just fun. If you have an ST and you have kids, take a look at Dorothy's kidprgs.

Hardware

Hardware companies were also well represented at the show by such notables as Fast Tech, Gadgets by Small, Talon Technology, ICD and Zubair Interfaces.

Fast Tech's Jim Allen, accelerator guru of the Atari World, was there to display Turbo16 and Turbo16e.

Turbo16 is a 16 MHz accelerator for 1040, 520 and Mega STs. Turbo16e does the same thing for Atari's STe computers. Although Fast Tech had the Turbo16e board on display, he did not have an accelerated STe because, according to Jim Allen, "I received my STe, literally, an hour before I left home [in Massachusetts] to come here. There was no time to install the unit and run the necessary tests and benchmarks."

Although Gadgets by Small was well represented by Doug Wheeler and Dave and Sandy Small, I regret to say I did not have time to stop and see a full demo of the latest version of Spectre GCR, *the* Macintosh emulator for the ST line of computers.

Displayed in the Gadgets by Small booth was a Tee-shirt with a picture of a Stacy portable ST with Spectre Cartridge and bold letters above it that said *"I Want My Mac ST."* Also displayed was Dave Small's latest 'toy', a Telsa Coil. Although it was prominently displayed, I have no idea what Dave had done with it, or had planned to do with it. Perhaps Gadgets had it there as a salute to Telsa himself who, in Dave's words, "Was the greatest hacker of them all." Quite an endorsement from the likes of one of the ST world's greatest hackers.

Talon Technology had, among other things, Omniswitch and their entry into the MS-DOS emulator market, SuperCharger.

SuperCharger is a small, external box that connects to the DMA port of your ST. From the moment you activate the program provided, you are in the world of MS-DOS. You can switch at will between ST and IBM modes without having to re-boot your computer. Another nice feature of SuperCharger is that, since it provides its own memory, you can use the SuperCharger memory as a RAM disk in ST mode. Multi-tasking can be done between the two modes and, best of all, you do not need a dealer to install it for you as with pcdittoII or PCSpeed. You just plug it in and go!

ICD was there showing off their new, STe-compatible hard drive host adaptors as well all the other goodies—like the FaST tape backup drive—we've come to expect from these folks.

Zubair Interfaces had plenty of Z-Ram 3-D boards, the unique "double decker" memory upgrade that fits inside the video shifter box in any ST or Mega computer and provides up to four megabytes of memory. Because of the unique design, you can be sure it will fit into your machine.

Dealers

Dealers did a brisk business on both days with almost every item imaginable for your ST on sale. Best Electronics offered everything from MegaClick keyboard springs to magazines to replacement mice. Best boasts one of the largest selections of Atari-related items around. Toad Computers had Portfolios, STe systems, Rainbow TOS, removable hard drives and many other items ready for sale.

Michtron was well stocked with their new offering: ATSpeed, the follow-up to their very popular PCSpeed IBM emulator, as well as all the other programs that have made Michtron famous in the ST world. ATSpeed boasts the same compatibility as PCSpeed, but runs faster than other popular emulators.

GEnie's New Aladdin

GEnie was well represented by Darlah Pine, ST Roundtable sysop. For those of you who are wondering, yes, Darlah is as nice in person as she is online. She was more than willing to take the time to talk with any and all.

GEnie's big news should be warmly received by ST users. In the near future Aladdin, GEnie's online navigation system, will be available to ST users. According to Darlah, all a user will have to do will be to download the appropriate file. Aladdin users have told me the online navigation commands it provides will save users time and money. Look for information about Aladdin on GEnie soon (By the time you read this, Aladdin should be available and in extensive use...watch for it).

Atari's Booth

On the other side of the partition from GEnie was Atari's booth. The most impressive aspect of Atari's presence was not the machines they brought to the show, but the people that manned the booth.

Among the list were Bob Brodie and John Townsend, both well known for their presence on GEnie. Also attending were so many knowledgable people I don't think that I could list them all. Although I didn't see him myself, I was told Elie Kenan, Manager of Atari North America, was at the show for a short time.

Although Atari had no TTs on display, they did have Portfolios and two STe systems. Demos designed to show off the STe computer's graphics and sound capabilities were running. The sound was surprisingly good and the graphics were excellent.

Perhaps the thing that surprised me most about the show was that everyone was so friendly. I had expected the dealers and developers to be personable—that's a part of their job—but I was not prepared for what I found in every nook and cranny: There was an atmosphere of camaraderie that comes from owning a machine you know is truly great, but never seems to get the recognition it deserves.

Only time will tell if Atari will finally market computers in the U.S. in the way we all know they deserve to be marketed.

Hard Driven Bargains!

TOAD Drives

TOAD 20 MB 40ms	$479
TOAD 30 MB 40ms	$499
TOAD 50 MB 40ms	$575
TOAD 60 MB 24ms	$659
TOAD 85 MB 24ms	$699
TOAD 85 MB 28ms	$669
TOAD 100 MB 25ms	$889

For a 28ms version of a 40ms drive, please add $20. For a 5.25" 360K PC compatible floppy, or a second ST compatible 720K floppy add $99. Please specify shoebox or under-the-monitor style case - the price is identical.

ICD FA•ST!

FAST 85 MB 24ms	$709
FAST 85 MB 28ms	$659
FAST 50 MB 40ms	$559
FAST 30 MB 40ms	$539
FAST 20 MB 40ms	$519
FAST 100 MB 25ms	$909
FAST 200 MB 25ms	$1649
FAST TAPE BACKUP	$769

*For a 28ms version of a 40ms drive, please add $20. These drives use the same mechanisms as our **TOAD** drives, but come in a slightly smaller case.*

Toadfile 44!

Toadfile 44	$799
Toadfile 44 Magnum (3 Carts Total)	$969
Toadfile 88X (Double)	$1429
Toadfile 94 (44+50)	$1169
Toadfile 74 (44+30)	$1099
Toadfile 129X (44+85)	$1249
Toadfile 129Z (44+80)	$1299
Extra Cartridges	**$89**

"I 'LOVE' the drive! All Spectre development is now being done on my Toadfile 44!" - David Small

Our Toadfile 44 removable cartridge hard drive has a 25ms access time, and uses 44MB hard disk cartridges. It's great for Mac & IBM emulation, or for a family, or just for unlimited storage!

Complete Two Year Warranty!

Tadpole Internals

Tadpole 21 MB 25ms	$389
Tadpole 42 MB 25ms	$449
Tadpole 100 MB 25ms	$699

These drives fit inside the Mega ST series computers and provide a low cost convenient hard disk alternative. They use little power so they're easy on your Mega's power supply.

SUPERCHARGER V1.4

BREAKS THROUGH THE BARRIER

Full MS-DOS Compatability With Real Time Multi-Tasking Plus **EXPANDABILITY**

We will buy your
PC-DITTO II™
OR
PC SPEED™
FOR
$75.00
When you purchase your SuperCharger directly from RIO Computers
Offer good thru Dec. 24, 1990

NO INTERNAL MODIFICATIONS REQUIRED

PLUGS DIRECTLY INTO THE DMA PORT OF YOUR COMPUTER

MS-DOS INCLUDED

- RUNS CGA AND HERCULES
- EQUIPPED WITH 1 MEG RAM
- USES EXISTING MOUSE AS DOS MOUSE
- SUPPORTS 5.25" OR 3.5" AS SECOND DRIVE
- PRINTS TO THE ATARI LASER FROM DOS
- SUPPORTS ALL HARD DISKS WITH AHDI DRIVER
- SUPPORTS ALL PARALLEL PRINTERS
- USES ST SERIAL PORT UP TO 9600 BAUD
- ATARI 3.5" DISK READS/WRITES AS 720K DOS
- SOCKET FOR 8087-2 CO-PROCESSOR
- USES SUPERCHARGER'S RAM AS 1 MEG RAM DISK
- USES ST'S RAM AS RAM DISK IN DOS
- RUNS 286 AND 3.0 WINDOWS
- BUILT IN BUS FOR FUTURE EXPANSION
- SEPERATE 5V DC SUPPLY
- INSTALLATION MANUAL
- 12 MONTH WARRANTY
- SHIELDED ABS CASE (FCC CLASS A CERT.)
- ONLY 6.25 X 7.25 X 2.25 IN.

SUPERCHARGER OPTIONS SOON TO BE RELEASED

SCplus/NET - Full networking board
- Connect DOS and TOS programs or files under Novell™ etc.
- Transfer rates of 2.5 Mbits/sec.
- Plugs into existing expansion connector with no soldering required.

SCplus/286 - Turns SuperCharger into a full 286 co-computer
- Runs at 12 MHz on a pure AT chip set
- Comes with 1 Meg of RAM expandable to 4 Meg - full EMS support
- Contains true AT expasnsion slots - accepts ANY expansion card
- Provision for an 80286 co-processor
- Plugs into existing V30 socket with no soldering required.

SCplus/386 - Turns SuperCharger into a full 386 co-computer
- Runs at 16 MHz on a pure 386 chip set
- Comes with 1 Meg of RAM expandable to 4 Meg - full EMS support
- Contains true expasnsion slots - accepts ANY expansion card
- Provision for an 80386 co-processor
- Plugs into existing V30 socket with no soldering required.

TRUE MULTI -TASKING

Connect several superchargers together to run different programs concurrently

HOT KEY

Allows TOS/DOS switching without rebooting.

TOOLBOX

Programming interface to allow programmers to develop their own background tasks.

LAUNCHER

Execute DOS programs directly from your TOS window.

SuperCharger - Only

$450

V1.4 Upgrade Kit - $19.95

A-T-A-R-I
Answers, Tips And Relevant Information

Paul Alhart (AFED)

Some time ago a friend was having trouble when using AtariWriter+ with SmartDOS.

We found that her P.R. Connection printer interface was booting the RS-232 "R:" handler over parts of DOS. This caused lots of strange things to happen. It also would reboot the R: handler whenever returning to AtariWriter+ from the Proofreader, compounding the problem.

Since she never used the RS-232 capabilities of her interface, the fix was simple. A jumper was placed across the two pins labeled "R Off" on the P.R Connection circuit board. This disabled the R: handler.

Recently, another friend who was having the same problem called. He however, was using an Atari 850 interface.

Sure, he could turn off the interface until AtariWriter+ had loaded. But if he forgot, the system would lock up and he would have to reboot from scratch.

He also had to remember to turn off the 850 when returning from Proofreader or risk a program crash. An inconvenience to say the least. There is no jumper in the 850 to disable the R: handler so I decided that it was time to modify AtariWriter+ again.

I located the code that tells the R: handler to boot and disabled it by making its first instruction an RTS (Return from subroutine).

Now, the R: handler is not loaded by AtariWriter+ and the problem is gone. If required, the R: handler can still be loaded by using the RS232.ARX program provided with SmartDOS.

This will eliminate memory conflicts with this DOS. (Most DOSes have their own RS-232 handler loader program for this reason.) This modification will work with the P.R. Connection and for other DOSes as well.

Making the Fix Yourself

To make the change yourself, use a sector editor and find the byte string [A9 50 8D 00 03]. It is located in the 21st sector of AP.OBJ (48K version) starting at byte $61. It can be found in the next to last sector of AP.OBJ (130XE version) starting at byte $68. Change the first byte [A9] to [60].

If you don't have a sector editor or the idea of modifying a program with one scares you, don't fret. Next month I will present you with a short "Type-In" BASIC program that will allow you to painlessly enable/disable AtariWriter+'s RS-232 handler loader routine as well as change the default screen colors of AtariWriter+.

RANA Drives

With a little help from my friends at Best Electronics, I found a direct replacement head stepper band for the RANA Systems 1000 disk drive.

The Atari 810 with MPI drive mechanism used the same band. Atari part # FA10034. Also, the head stepper motor (CB101145) and drive motors (FC100520) are the same as those used in the Atari 1050s with the Tandon drive mechanism.

Best Electronics (an AIM advertiser) is one source for these parts. Give Best a call and be sure and ask for a copy of their latest catalog.

PS: I am still looking for a source for Drive Belts for the Rana. If you know of one let me know and I will pass the information along to my readers.

Putting in a Write Light

While I'm on the subject of RANAs. Would you like yours to have a "Write Light?" Trak drives have a LED that lights whenever data is being written to the disk and your RANA can too.

You might be surprised how little time the drive is actually writing data. Connect an LED in series with a 330 ohm resistor between +5 volts and the junction of U7-8 and U10-13.

NOTE: The cathode of the LED should be toward U7-8. The LED can be mounted wherever you choose. I converted the semi-useless "Power" indicator on my RANAs to be a Write Light.

To do this J8 has to be unsoldered and removed from the board. With the connector removed, cut both ground traces that connect to J8 pin 11. Replace J8 and run a wire from J8-11 to U7-8. You might also want to replace R1 (330 ohm) on the front panel display board with a 160 ohm resistor to make the LED a little brighter and easier to see.

You can find more RANA tips as well as schematics, alignment instructions and waveforms, and repair hints in my book—The Rana Repair Guide.

To order your copy, send $18 (check or M/O) to:

Lompoc, Ca. 93436

AtariWriter+ The Final Chapter

For Those Who Don't Want to Read the Book

Jimmy Boyce (CACE)

As you may have guessed this is it. The lazy one is going into retirement for the rest of the fall as a writer. Perhaps if our worthy leader is nice to me this winter I will review indepth something else.

So here we are at <pg68> Building A Subset. Now there is an interesting word—SUBSET. For our use, it is a file within a file. Let's say that as writers we are very prolific and we write science fiction (SF) about computers, about rockets, about little green people and large green people. We write about four different types of SF.

For the sake of illustration, there are several different publishers for each of these four types of sci-fi. From our file of sci-fi publishers we will attempt to set up four subsets.

To keep this simple, I am going to use the default format as an example. In attempting to use this subset system for purposes of writing this article, it left a lot to be desired. The book is very ambiguous with its directions.

The one thing I could not figure out was how to save the subset once you created it. Next, you would have to have some sort of code on each of the various publishers in order to get to the four various types. If you have created a format (remember <pg66>?), that format will appear on the screen because the way you start this whole process is to load a file.

So let's start—first load your file with coded publishers that has your own format. After the file is loaded and the menu reappears on the screen, you raise your finger in high expectation and aim at the [B] key and zero in on it with the precision of a mosquito. OK, Bunky I know, I know—On with punching the letter [B] to build a subset.

There on the screen resides your format but in a slightly different form. The left-hand column is labeled FIELD NAME, and to the left of the field name is a number (more about that in a minute). In the center column is a column of dashes (as you set them up) labeled LOW VALUE. On the right is a duplicate column of dashes labeled HIGH VALUE.

Let's say you have gone back and very tediously coded each of the four types of publisher names with a number (remember UPDATING A FILE <pg65>?). Either you incorporated it into an existing field or you created a new field.

For the sake of ease, let's say we created a new field and it is number nine (9) in the left-hand column. The cursor is on the first dash of the first field. Hit [RETURN] until you are at the first dash of field number nine.

At this point, you type in [1] for the code of the first type of publisher and right arrow [SHIFT][*] over to the first dash under HIGH VALUE. Here type in a [1] and hit return.

Since number nine was your last field and since the cursor now sets on the first dash of a line labeled SEQUENCE BY FIELD NUMBER _ _ , do not type in a nine. That will result in a terse little message that refers to the low I.Q. of the typist. Over the first dash type a zero. Over the second dash type the all important nine.

To see your subset in all its glory, smash the [ESC] key with delirious fervor. Before your eyes there is a list of names I have no vague notion how to get off the screen and onto a piece of paper via your printer.

Now there is one of those little bits of information that is labeled *important*, only the second sentence makes any sense to me.

So for the first, last and only time and without the author's permission, I am going to quote verbatim what is printed in this wonderful little tome of information:

"Important: If you build a subset, only those records that fall into the subset will be available when updating records. To erase the subset, enter [0] [0] for the SEQUENCE BY FIELD _ _."

With that, we shall forever close the book on subsets unless someone wants to tell me how to do the things that I cannot do, that render this whole mess useless as far as I am concerned.

Data Base Merge Character

Now here is a nifty and useful part of this program that if I had read it a long time ago, and especially before writing this, I would not have said a subset was useless. I guess I should go back and rewrite the whole article but I did not get the nickname "the lazy one" by rewriting whole articles.

With this agreeable little utility, you can take that subset and put the publisher's name and address in the proper place in your form letter that you are sending to all of those editors that are going to read your latest SF manuscipt.

This DATA BASE MERGE CHARACTER has the appearance of a little heart. You know, Bunky, the one that appears on your screen when you hold down the [CONTROL] key and the [,] key. Well, you get one every time you hold down the [OPTION] key and the [M] key.

Remember those little numbers on the left side of the subset format menu? After you get the little heart on the screen, type in the first number that would be the name and hit [RETURN]. The next line would be the street address, so type [OPTION][M] and the next number, then [RETURN]. To get the lines to appear as an address should look just hit [RETURN] after each [OPTION][M] and field number. Failure to do so will result in that field not being printed!!!

Remember that if you want ten addresses printed, you will need to type in a ten (10) when prompted as to the number of copies of your letter you want printed. This will not type your entire file, only a subset, but it is easy enough to turn your entire file into a subset if you want to address Christmas envelopes.

Well, folks, this epic has been a year and a half in the making and is now finished. It has been fun and I hope not too confusing and hopefully has been of help. Bunky and I must move on to other topics of importance. Bye!

$19.95

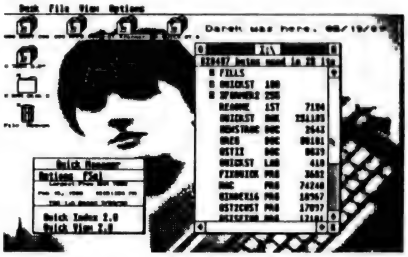
FEEL THE SPEED!!

Quick ST II

- speeds up screen graphics faster than hardware accelerators
- speeds up all fonts, including GDOS fonts
- requires less than 25K of memory and runs on any ST or STE
- supports all screen resolutions, including Moniterm
- supports custom desktop backgrounds and fonts

The screen shot on the right shows a typical ST desktop with Quick ST's desktop background feature installed. Supports .PI2 and .PI3 DEGAS pictures.

Also shown is the Quick Manager tool manager, free with Quick Tools.



$29.95

10 UTILITIES + QUICK MANAGER

Quick Tools

- includes 10 useful Tools, including a command line interpreter, fast file viewer, speed benchmarker, label maker, file finder, environment editor, and more. Each Tool can run as .PRG or .ACC.
- includes Quick Manager, which supports 10 desk accessories, displays the time and date, free RAM, and TOS version.
- requires less than 70K of memory and runs on any ST or STE

The ATARI XL/XE Commercial Software Drought is OVER !!!

SOFTWARE INFINITY proudly presents its Brand NEW *KE-SOFT Series* -- the First Major ATARI XL/XE Commercial GAME Releases to be produced for the North American market since 1987 !! Eleven spellbinding super-sophisticated 1991 GAMES on 9 economically-priced premium quality Disks ! Already Bestsellers in Europe -- newly enhanced to revitalize your XL/XE !

Every GAME in *SI*'s *KE-SOFT* line boasts ultra-realistic & colorful state of the art high-resolution animated graphics, outstanding music, and lots of clever surprises. Many also feature digitized speech & sound effects, high-score saves, a password system to skip levels, and a capable Editor to near-effortlessly create your own new screens. Handsome and comprehensively detailed printed Instruction Manuals are written in clear, easily understandable English. All 11 superior 64K *KE-SOFT* titles are endlessly entertaining to novice and experienced ATARI GAMErs alike.

$10.50 GAMES
2 or more for $9.50 each !

ZADOR

Turn over all 144 Chinese-symbol tiles on the game board by matching singles to make pairs that are solely connectible by an invisible line (which can't cross any active tiles or be bent more than twice)! A high-powered Mah-Jong variant with 20 levels and useful "prompt next pair" option.

DRAG

Guide intrepid Drag the Frog past deadly mines, exploding bombs, & falling rocks in a treacherous underground lair, to collect diamonds before his air runs out! 50 screens of Boulderdash-type arcade action.

SOGON

Navigate your sturdy forklift around the 50 barrier-filled floors of a skyscraper to relocate large boxes one at a time to waiting storage bays. Once you've moved a box to any perimeter-wall or partition, you can't pull it back! Devious chess-like strategy; vital backup-one-move function.

ZEBU-LAND

Help Zebu engineer the escape of his 3 brothers from a 50-level labyrinthine world of revolving doors and blocked passageways (move wall-segments aside to reveal exits)!

DREDIS

At last -- the unparalleled mind-boggling Commercial ATARI XL/XE version of the arcade champ Tetris! Ultra-challenging puzzle, multiple levels of difficulty, one- and 2 - player modes.

Order 3 or more *KE-SOFT* GAME titles Mixed ($14.50 & $10.50 items together) -- subtract $1.50 from the price of each !

BACKUP COPY of any GAME Disk is $2.00 if purchased at same time as Original; $ 4.00 if ordered later.
Great *KE-SOFT* GAMES *DEMO DISK* with playable sample screens -- FREE with any 2 GAME Disks, or $4.00 separately.

SHIPPING And HANDLING is always just $3.00, regardless of quantity of *KE-SOFT* products ordered.
NO State Sales Tax is due on any SI Disk.

$14.50 GAMES
2 or more for $12.50 each !

TECHNO NINJA

Voyage to a hostile alien world to reclaim your home planet's ultimate source of power! Encounter 10 perilous landscapes (cities, bodies of water, spaceships, etc.) on 100 screens. Gain energy, earn up to 8 extra weapons, battle over 50 varieties of monsters. Enhanced density disk.

CULTIVATION / CHROMATICS

Two brain-busting puzzlers on one disk!
CULTIVATION: Put away your Farmer's Almanac -- this game's about the strategic "cultivation" of matching symbol-blocks; push together like singles in the proper order to make pairs and clear your choice of100 screens on 10 levels.
CHROMATICS: This mesmerizing 3-level Tetris-style contest utilizes 3 - 5 different colors instead of shapes; rotate the hues of blocks falling into a well to place 3 or more same-colored blocks together at the bottom.

OBLITROID

As the last Star Warrior of Xyros, you must track the evil Tindalos to his underground dungeon and engage in mortal combat! Find special weaponry to survive never-before-seen dangers on 4 Worlds comprising 140 screens; invaluable stop/continue mode. Extensive Manual is packed full of maps & tips. Enhanced density disk.

TOBOT / BROS

Two invigorating arcade adventures for the price of one!
TOBOT: Using his versatile laser gun, our robot superhero must escape a spooky 50-room castle filled with angry spiders!
BROS (Super Mario Brothers - inspired): Traverse 8 Worlds with 4 Underworlds each to rescue your brother from a hidden castle -- collect mushrooms to get power or shots, gather coins to earn additional lives, and vanquish legions of monsters!

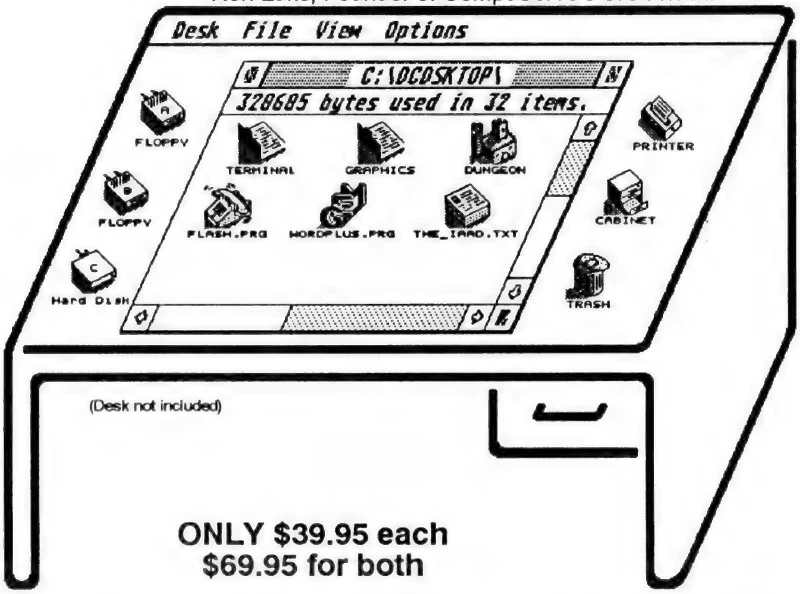
DC DESKTOP

New Programs and Features
ONE LOW PRICE!

"The GEM Desktop just got better"

"DC Desktop is a permanent part of my system."
–Ron Luks, Founder of CompuServe's SIG ATARI



(Desk not included)

ONLY $39.95 each
$69.95 for both

Enhance, don't replace!

- Place programs & **folders** right on the desktop
- Display unique file, folder and drive icons
- Color icons
- Store frequently used files and programs in our exclusive CABINET virtual disk drive
- Display NEOchrome, Degas, TINY, Spectrum, ART director and Mac pictures from SHOW
- View files at the desktop with an enhanced SHOW routine (with mouse control!)
- Replace the desktop with a pattern or picture
- Recover files from the trash
- Spool/queue printing from desktop or program
- Works in all resolutions, STE and TT too!
- Drop down menu commands via keystrokes
- Load different desktops with a keystroke
- Comes with a command line interface, bootup selector, terminal, icon editor, more
- Special hooks let RAM resident programs be called with one key from DC Desktop
- Completely modular and memory resident – only use what you want!

Their Finest Hour

Rich Scheidel (CCCC)

It all started eight months ago when my boss asked me if I had ever heard of a game called "The Battle of Britain." Huh? He was looking in one of those IBM or Commodore game magazines that proliferate at the stands.

"I doubt it'll ever be ported over," I said. I looked at the magazine and ruefully shook my head. "Look at this," I said. "Holy cow! This looks fantastic." I looked further and read and reread...and wished.

When Wishes Come True

I just went to Derric's in Hamden, CT and...behold! There on the cover of an English magazine was a WW-II flight program that looked a lot like "Battle of Britain."

I ripped it off the rack, skimmed the table of contents and there it was..."Their Finest Hour." Lucasfilm Games' new name for Europe's "Battle of Britain." Wow!! They did it!

"Is it in stock?" I asked? "No, but check back during the week."

Seems I wasn't the only one to ask. A fitful week went by, but come Saturday, it was on the car seat next to me heading up the Wilber Cross Parkway at an unreasonable speed.

For the next three hours, I ignored wife, telephone, dog and the world, and read into "Their Finest Hour." Ohhh...this is great! This is gonna be the source of many a late night.

For starters, Lucasfilm has no copy protection on "Their Finest Hour" (to be referred to as "TFH" herein). They use a Radio Frequency wheel with many codes built in as their protection.

You also need the manual for small tips, which, if you don't read, the game will go on but as "Crippleware." Neat! So that's great news for hard drive owners, as the screen updates will be fast.

I did something different. I don't have a hard drive. I loaded the entire game into a RAMdisk! You want to talk about fast screen updates?? Ha!

Getting Started

When you boot TFH, you have the option of being either an Allied or Axis pilot, with more options on the Axis side.

Your choices as an Allied pilot are two models of Supermarine Spitfire or two models of Hawker Hurricane aircraft. The Hurricane has an excellent ability to sustain incredible damage and has moderate performance. The Spitfire has fantastic performance, but you gotta watch your damage level.

As an Axis pilot, the choices are immense. Fighters, fighter-bombers and bombers! The Messerschmidt Bf109 E is heavily armed, heavily armored and fast as hell.

They also have the Messerschmidt Bf110 C-4, a fighter-bomber, two dive bombers, the JU-87 Stuka and the Junkers JU-88. Also included are the two most widely used bombers by the Germans in World War II, the Dornier Do 17 and the Heinkel He 111-H.

The fighters perform as expected...fast. The bombers let you switch from pilot to gunners at the mash of a key! Trying to keep the bomber on target while under attack is tricky, but then...you mash yet another key and turn the aircraft over to the bombardier!

He (you) will guide the aircraft on final approach, but you can still jump to a side or nose gun and wail away at the British fighters that continue to try to blow you outta the air. Incredible!

Graphics are awesome (especially pouring out of a RAMdisk!) Tracers fill the air, chunks and pieces of aircraft fall off as you stitch up the enemy with machine guns or switch to cannons! Smoke trails and flames belch out of doomed aircraft.

Even Make Movies of Your Fight

Record the action for later viewing with onboard cameras!

It's a replay camera that will record the entire sequence from an outside point of view, use it just like a VCR! Rewind, play, stop, forward, zoom in, rotate from a different angle, whatever you like. Somebody did their homework on this one!

This is very different from Falcon, in which you could lock a missile on the enemy and fire without ever seeing the guy! Everything is close up.

In fact, it has to be. You might be shooting at a friendly if you act too quickly—which brings up the problem of identification.

Both sides use camouflage paint schemes and it's up to you to properly identify that oncoming plane. I've got to get further into the game to get better at that. I'd swear I've shot at friendlies, but nothing has happened because of it...so far.

Like I said earlier, the game is not copy-protected. If you are going to play using floppies, make backups the normal way...put your originals away.

If you only have single-sided drives, you can get the game on single-sided disks from Lucasfilms. You can control the game by keyboard, joystick or mouse, with mouse providing superior control in my humble (HA!) opinion. Make up another disk to use as a mission save/pilot data disk.

To wind this up, I'd just like to say I'm real happy to see Lucasfilm port this over. I didn't think they would do it, especially with the experience they had with their 8-bit offerings.

This is a "most excellent" game that had me hooked from the moment I saw it...eight months ago.

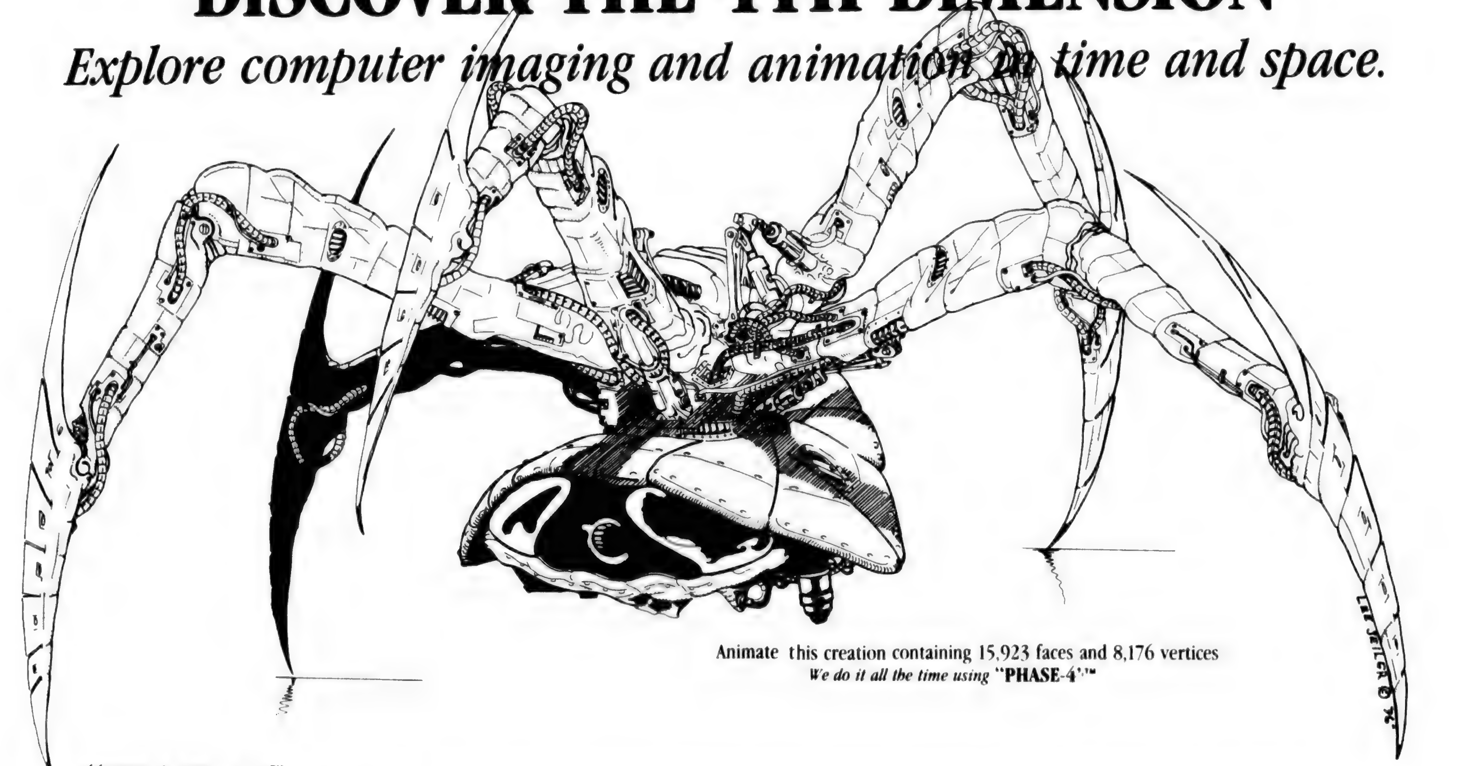
DISCOVER THE 4TH DIMENSION

Explore computer imaging and animation in time and space.



Animate this creation containing 15,923 faces and 8,176 vertices
We do it all the time using **"PHASE-4"™**

"PHASE-1"™
ROSETTA-3D

Just as the original ROSETTA STONE allowed scholars to decipher the secrets of Egyptian hieroglyphics and translate them into other languages, ROSETTA-3D allows you to translate a wide variety of the most popular CAD, animation, and rendering formats. Files created by ROSETTA-3D can be transported to many different computer systems and modeling programs or may be sent to remote rendering services capable of creating photo realistic quality images for commercial use. You are no longer confined to the limits of one machine or your current animation software. ROSETTA-3D Object Viewer is much more than just a file translator, it is also a draft animation package. It allows you to quickly create and preview an object file you wish to animate in "PHASE-4's" CHRONOS Keyframe Animation Studio, from any format that you select using the fastest wire frame and solid-polygon render available for the Atari ST™. ROSETTA-3D's simple point and click animation system features a unique three dimensional "object-marker" which enables you to design animation story boards for waiting clients in a matter of seconds. *Price $59.95*

ROSETTA-3D FEATURES:

File Translation:

Direct translation from one format to another format. Translate objects which are too large to animate on your system. File size not limited by system memory size.

Import and/or Exports: Eight Three-Dimensional Modeling Formats Supported.

- AutoCAD Release 10 ASCII (DXF), Binary (DXB) for the IBM and Macintosh.
- CAD-3D Version 1.0 (3D) and Version 2.0 (3D2).
- PHASE-4 Animation Libraries (LIB).
- Sculpt-3D for the Macintosh and Amiga.
- Swivel-3D for the Macintosh.
  ... and output of P.I.X.A.R.'s Renderman RIB files!

Animation Capabilities:

- Fast Depth-Cue "Point Cloud" mode, for real-time playback of extremely large objects.
- High speed wire frame and depth-cue wire frame modes.
- Several solid-polygon modes.

Object limitations:

- Any combination of 65,000 vertices and faces per object.
- Total number and size of objects limited by memory size only.
- Animate objects with over 15,000 vertices and 30,000 faces on 1Meg systems.
- ROSETTA-3D expands ANTIC™'s original 3D universe in all directions to more than 400 times its original size.
- Full 24 bit color - w/16 million colors
- ATARI TT/68030 VERSION.

DISK, FILE, and FOLDER Management Supported.

"PHASE-4"s (ADEPT) Supported.

Object limitations:

- Any combination of 65,000 vertices and faces per object.
- Total number and size of objects limited by memory size only.
- Animate objects with over 15,000 vertices and 30,000 faces on 1Meg systems.
- ROSETTA-3D expands ANTIC™'s original 3D universe in all directions to more than 400 times its original size.
- Full 24 bit color - w/16 million colors
- ATARI TT/68030 VERSION.

PRISM-PAINT

(Photo realistic Rendering Interpreter for Solid Modeling in Advanced Graphic Environments)

PRISM-PAINT 1.0 is a powerful drawing program that runs in all ATARI resolutions plus 1024X768 4096 color mode and 24 bit true color with 16 million on-screen colors and is fully TT-32 bit tested and 68030 compatible. Not only will you find many of the features expected in a drawing program (such as boxes, circles, ellipses, area fills, cut, copy and paste, (with fine pixel editing), but also explores some rather unique areas of it's own! One of the more interesting areas of **PRISM-PAINT** is that it uses **PRISM-TABLET** (Graphics Tablet Environment) which supports the new Cal-Comp graphics tablet in four resolutions. Another feature of **PRISM-PAINT** is that it uses all of the computer's memory to support multiple picture buffers. This can range from approximately eight buffers on a 520ST to over 110 buffers on the MEGA4 ST, which allows the creation of animations using the built-in slide-show features. When used in combination with other PHASE-4™ programs **PRISM-PAINT** takes full advantage of ADEPT* and the Image Systems ISAC High-Res color board. *Price $49.95.*

COMPLETE HIGH RESOLUTION ARTIST PACKAGE: This package is intended to upgrade any MEGA ST computer to full color graphics workstation status. ARTIST PACKAGE Release 1.0 features 4096 color palette support with/24 bit 16 million colors available in the professional package. When used with Syquest 44 HD system, the artist can create real time animations up to 55 minutes long in all supported color platforms/with full 64 channel midi movie sound track support.

PACKAGE HARDWARE INCLUDES: Image system 1024x768 high resolution color board, Pal-800x600 kit. Software included: **PRISM-PAINT** with new high-density, .DLT cluster technology and .FLM file formats. TT-GIF file display program. Cal-comp Tablet driver with LEXICORS ADEPT pipeline imbedded in all programs allowing full upgrade compatibility for the professional 24-bit 16 million color **PRISM** photorealistic rendering programs. Animation and GIF art disk designed to get the artist started right away. Compuserve online certificate for LEXICOR on line access to **PHASE-4** tutorials and online support.

Artist package priced @ $775.00 plus $5.25 Shipping and handling.

PRISM-TABLET is a fully functional graphics tablet environment designed to be used with all "PHASE-4"™ programs. This feature is embedded in all programs and available as a stand-alone program which can be used with most well-behaved ATARI programs. *Price $29.95 if ordered separately.*

For more information write or call Lexicor Software Corp., 58 Redwood Rd., Fairfax, CA 94930, (415) 453-0271. Dealer inquiries welcome.

Developer Beware!

Robert C. Arp, Jr.

Prefacing the documentation of some software packages you will find a disclaimer; in other packages you will see a limited warranty that includes one or more guarantee options. Perhaps you have wondered why those responsible for the design, implementation and/or distribution of software find it necessary to use these disclaimers and limited warranties as instruments to disassociate themselves from the purchase and use of that software.

After all, is it not the buyer who faces the danger of expense sans recompense? Well, I'm sure that we've all suffered the "pisses me off" syndrome connected with the purchase of software which did not meet our expectations.

And it's true that often the snit in which we are cast can be attributed to one or more of the entities involved in the exchange of payola for computer guanola. But of course, there's more to the story than guanoware; otherwise there'd be no material for discussion.

There is a Frankenstein's monster atmosphere associated with software production. Programmers can easily slip into paranoiac listlessness as they confront each possibility of user misuse and execution environment incompatibility.

One instance of inappropriate behavior by a user could sentence a programmer to months of ridicule on bulletin boards across the world.

I doubt kitchens get any hotter than those in which Atari ST software is cooked. I'm willing to bet that the software produced by ST developers is exercised and scrutinized within the most hostile and volatile of all computer execution environments.

Each program executed from the Auto folder; each resident desk accessory; each added piece of after production equipment; each of these aberrations twist the ST environment into a mutinous mutilated mutant waiting to devour even the most carefully crafted algorithms. It's a jungle in there.

ST software developers must navigate this jungle with the grace of a ballet dancer, while wearing the hide of a rhinoceros, because ST users are formidable, nitpicking ass-chewers. Like disciplined marine drill instructors shouting, "I can't hear you!" they whip and cajole production of the best software for the cheapest price.

Slackards don't last long in the ST development environment. What happens to programmers wrung and hung by the ST community? They transfer to another outfit—to work on Apples, or Amigas, or IBMs.

So, if you, as a potential ST developer, are viewing the ST community as a berry patch for easy pickings—beware; them ain't berries, they's briers.

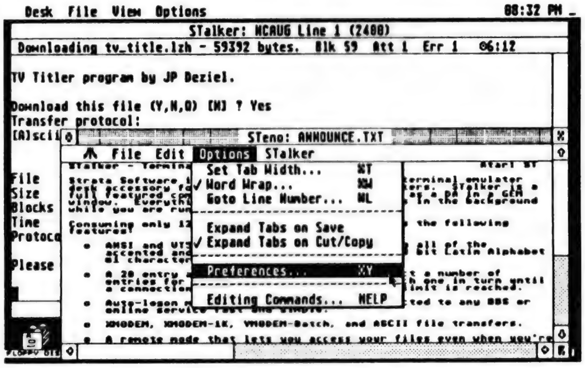
STalker and *STeno*

an unbeatable accessory combination at an unbelievable price: **$30 for both!**

STalker is a complete terminal emulator that does **everything** in the background. *STeno* is a text editor that uses as little as 90K of memory. Both programs utilize the GEM clipboard to exchange data, allowing you to cut and paste between them, and both programs are Moniterm compatible!

***STalker* features:** fast popup menu or convenient ALT-keys for command entry ♦ *background* file transfers ♦ *background* dialing of any group of numbers ♦ separate terminal / RS232 / auto-logon settings for each dialer entry ♦ scroll-back buffer of up to 2000 lines ♦ 20 programmable function keys ♦ VT100 & Atari VT52 emulation ♦ can optionally be used with Shadow™ ♦ capture directly to *STeno* ♦ **New** "Remote Access" (BBS) mode ♦ Easy to use - ideal for new users!

"A **GREAT**, Full Featured Terminal Program" - ST Report #112



Downloading tv_title.lzh - 59392 bytes. Blk 59 Att 1 Err 1 06:12

TV Titler program by JP Deziel.

Download this file (Y,N,Q) [N] ? Yes
Transfer protocol:

***STeno* features:** command entry via ALT-keys or the unique menu bar *inside the accessory window* ♦ configurable word-wrap ♦ search and replace ♦ *background* printing ♦ variable tabs ♦ choice of font sizes ♦ Mac-like cut/copy/paste and text block selection using the mouse ♦ hot-key to/from *STalker* ♦ fast paragraph reformatting ♦ can be used as a type-ahead buffer for *STalker*

STalker and *STeno* are available **now** at your local dealer, or from:
Strata Software 94 Rowe Drive, Kanata Ontario Canada, K2L 3Y9, (613) 591-1922

Fonts

We are proud to announce the introduction of a complete *high quality* yet *low cost* line of vector fonts suitable for use with Calamus, Calamus Outline and Pagestream!

These fonts are available in groups of three or more for the price of

$39.95 Each Group of 3 fonts

All Nine Font Groups: 30 fonts for only $199--Save Over $160!

See your dealer or

Mega Click™

For the Atari Mega 2 and Mega 4* Computers

BEST ELECTRONICS

New Product Announcement

Have you ever felt that something is missing from your Mega* computer? Those who have used other brand computers for work or school agree something is missing! When asked, any touch typist who owns a Mega computer will tell you right away! It's the Click in the keyboard key they miss!

Best Electronics is happy to announce their new product for the Mega 2 and Mega 4 keyboards called "Mega Click." By the name you can tell what this product does. After searching the world for half a year, we've found a replacement keyboard switch that gives the Mega owner that positive tactile "click" response like most real-world keyboards!

Our test sampling of Mega owners, who have tried our test Mega keyboards with Mega Click installed, all say the same thing, "I want the product now!"

The installation of Mega Click keyboard switches requires the ability to unsolder and solder-in components in your Mega keyboard. We strongly recommend that installation be done by an Atari computer service center!

Mega Click keyboard switches are packaged in a **30 Switch Starter Kit** and a **10 Switch Add-on Kit**. Suggested retail for the 30 Kit is **$64.95**, and for the 10 Kit is **$21.95**.

Mega Click Products became available December 26th. Place your order now!

ATARI 8-BIT

SOFTWARE - PARTS AND BOOKS FOR ATARI XL / XE & 800/400 COMPUTERS

1050 MECHANISM

Factory fresh TANDON mechs. make difficult repairs a snap. Units are complete with Head, Stepper, Spindle motor, belt etc. Just plug in, no difficult alignments or adjustments required.

$47.50

POWER PACKS

Exact replacement transformer for 800/400, 1050 810, 1200XL, 850, and XF551 units. Part #CO17945. $14.50

XL/XE SUPPLY

Power Pak for 800XL,600XL 130XE, 65XE & XE Game. $25.00

KEYBOARDS

New and complete subassembly. Easy internal replacement.

130XE/65XE	$35.00
800	$40.00
800XL	$29.50
400	$12.50

XL 40 PIN LSI CHIP SET

A Complete set of 40 Pin Large Scale Integrated Circuits for your 800XL, 600XL or 1200XL computer.

Great for quick repairs! Set contains one each of the following: CPU, GTIA, ANTIC, PIA AND POKEY. $16.95

800 4 PIECE BOARD SET

Includes Main Board, Power Supply Assembly, CPU Module and 10K Revision B Operating System Module. All boards are new, tested and complete with all components. $28.50

800/400 MODULES

NEW PARTS COMPLETE WITH IC'S

• CX853 16K RAM Module	$9.50
• 800/400 CPU with GTIA	$8.75
• 800 10K "B" OS MODULE	$8.75
• 800 POWER BOARD	$14.50
• 400 POWER BOARD	$9.50

Basically Speaking

Jeff Summers, ACORN

Sometimes, when programming in BASIC, you will need a fixed set of numbers loaded into memory.

An example of this is a reference table like the XYZ tax tables (this being just after a big tax debate, I figure this is on everyone's mind). BASIC's most convenient way for storing a related series of numbers is the array, but you have to fill the array with numbers. One way would be like this:

```
10 DIM X(10)
20 X(1)=25
30 X(2)=32
40 X(3)=45
(etc.)
```

That method is tedious. What we need is a way to fill an array with a set of known numbers. BASIC allows this by use of the READ and DATA statements.

READ is used very much like INPUT and has the same restrictions. The only difference between INPUT and READ is where they get their information. INPUT will get data from the keyboard or other device, READ gets its info from DATA statements within the program. The equivalent set of using READ and DATA would be:

```
10 DIM X(10)
20 FOR I=1 TO 10
30 READ A
40 X(I)=A
50 NEXT I
60 DATA 25, 32, 45, ...
```

A few important things to note: First, the program ends up being much shorter (or would be if I had written all ten assignment lines in the first example).

Second, all the data is in one place and therefore is easy to find if you need to make a modification. Third, like when using INPUT, you can't READ directly into a dimensioned variable. In this example, I read the data into A and then transferred it into the X array in the next line.

If you have several sets of data that you may want to read into the same array depending on conditions, READ/DATA allows for this also. The method used for this is to use the RESTORE statement to specify the line where you want READ to start getting its data. Here's an example:

```
10 DIM X(5)
20 PRINT "Which Data Set Do You Want"
30 INPUT S
40 RESTORE S*100
50 FOR I=1 TO 5
60 READ A
70 X(I)=A
80 PRINT A
90 NEXT I
95 GOTO 20
100 DATA 1, 2, 3, 4, 5
200 DATA 23, 42, 61, 17, 8
300 DATA 21, 20, 19, 18, 17
```

Now, the first thing to notice is that we have calculated depending on the user's input where we want the data to start. RESTORE sets the "data pointer" to that location. Each READ will then pull data from that line, and the subsequent statements fill the array and print the data to the screen (so you can verify that I'm not lying).

The last point I'd like to make is that, like with INPUT, you can also READ strings. This is most useful with RESTORE as, if you simply wanted to assign a set of characters to a string, it would be just as easy to declare it as READ it— remember there are no true string arrays in ATARI BASIC.

However, with RESTORE you may select which set of characters are loaded into your string. The first obvious application of this is in quiz type programs where you can read a response dependent upon user input—"Great job!" or "That's close but you forgot..." Another obvious use for this is in error handling routines. Depending on the error, you could read an appropriate message into a string and print it to the screen.

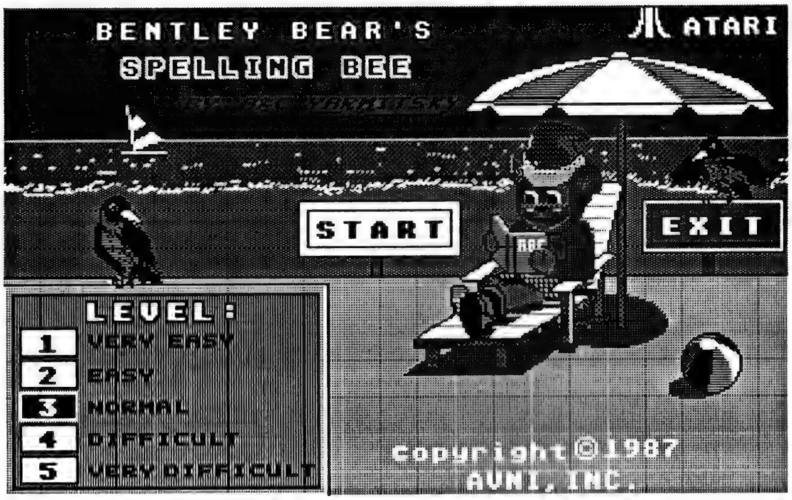
Bentley Bear's
Spelling Bee & Magical Math II

Nancy Kanski (COAC)



The Bentley Bear Spelling Bee and Magical Math II programs were designed to be used on the Atari Mega and ST computers, and I could hardly wait to show these programs to my eight-year-old daughter, Amy.

I was impressed with the colorful, hard-bound folders the disks and booklets came in. The instructions were clear and easy to follow. Amy was eager to get started, so without waiting to figure out how to use the program, she immediately turned everything on and inserted the Spelling Bee disk. Two disks were provided, one for monochrome and one for color monitors.

Amy was impressed with the seaside scene and using the mouse, she chose Level 1—Very Easy to begin with. Then clicking on Start, she was greeted with Bentley Bear standing in a pool, with a honey cooler and a seagull nearby.

To help Bentley, she had to choose a letter from the alphabet to complete the word at the top of the screen. Everytime she missed, the seagull hopped closer to the drink. When she couldn't figure out the word, the bird would drink the honey cooler. Bentley, being as smart as he is, didn't give the seagull much opportunity!

Amy did try all five levels with level three being a challenge to her and five impossible at this time (this version, grade level 3-6). We both were amused by the antics of the seagull and Bentley's expressions and enjoyed the animation and lively tune throughout the program. This makes guessing words fun, encourages your child to sound out letters in each word that appears and also increases the words in their vocabulary.

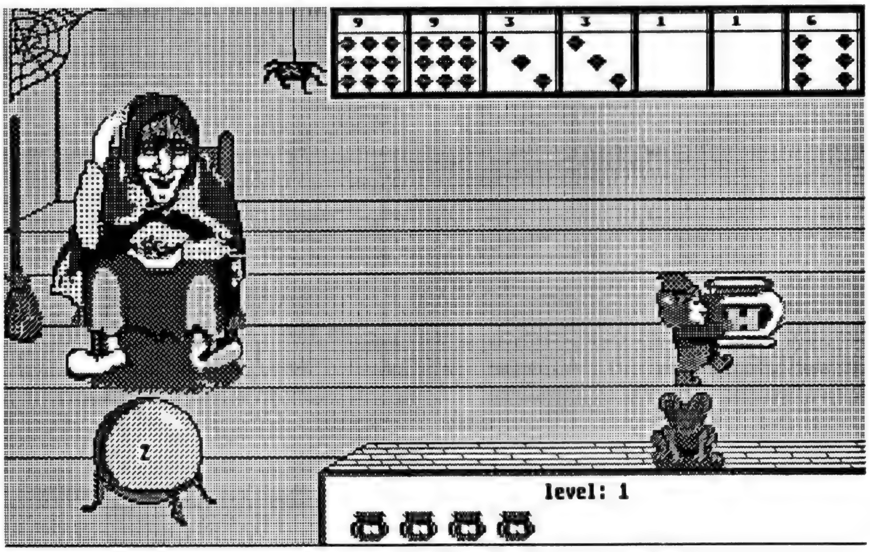
There is a separate UPDATE. PRG which can be used to add or delete words used in the program's dictionaries. Each level of difficulty has its own dictionary. It was hard to stop playing, but we had decided to investigate...

Bentley Bear'S Magical Math II! Here Bentley is dressed as Robin Hood and he has come to claim his pots of honey in the witch's cabin. In exchange, Bentley has to give her the correct number of jewels. To get the jewels, you must add the right numbers in the windows, press the mouse button to release the jewels from Bentley's bag and take them to her. If your answer is correct, Bentley walks away with the honey. You must be careful, for a Black Widow comes down to take away the honey pot if you take too long.

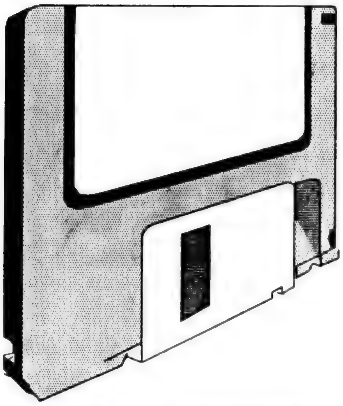
Amy and I really liked this program and found it to be a delightful challenge and comical as well. The witch's expressions, the frog that croaks (this frog is full of surprises!), and the spider tha can come down as fast or as slow as you desire all add to the program.

You can also choose one, two, or three digit numbers to add. It makes math fun!! This program was designed for Grades 2-3 and can be used on monochrome or color monitors.

Here, Bentley Bear is walking off with the honey pot after successfully picking out the correct amount of gems (2), then giving them to the witch.



Aim Disk of the Month
December, 1990



All files on this disk are self-extracting LZH archives created with Double Click's ARC program DC SEA! To use these programs, simply double click the files. Then, click on *Extract* and select the drive/folder to which you want the extracted files saved. Click on *Verbose* to get a list of the files in each archive or *Exit* to abort.

Here's a short description of the files found on the December '90 disk. For more complete documentation, see the text files contained in most of these archives.

CHAME117.APP—Chameleon is an ACC that loads any other ACC at runtime and allows for unloading of the loaded ACC at any time. PD from Germany. English docs included.

CHEETAH3.APP—Version 3.0 of the super fast file/disk copier. Shareware.

COUNT3.APP—A versatile counter for writers. Counts number of words, sentences and more. Generates a handy report. Written by Dave Stuart.

C_BURST2.APP—Color Burst is a paint program allowing use of 200 palettes per screen. Dynamic interlacing allows over 3000 colors on an ST and over 29700 colors on an STe. Source code in Laser C included. Color *only!*

DCMENU.APP—DC MENU v1.0 is the *first freeware* extension for Double Click's DC Desktop. DC MENU allows you to assign keystrokes to execute programs not placed on the desktop. Uses capabilities *already* existing in DC Desktop. Requires DC Desktop from Double Click Software.

DCPICK.APP—Another *freeware* extension for DC Desktop. DC PICK can run as a program or accessory, and allows you to pick any file for viewing with the installed SHOW modules. When run as a desk accessory, you can view text, ARCs, pictures (and more soon) while in any program. Requires DC Desktop.

DELTA_X.APP—Feature-packed disk labeler from Germany. Mono *only.* Don't worry about the bombs displayed when exiting this program...the author has a weird sense of humor! Docs in German only.

DIABLO.APP—New, fixed version of the Diablo emulator for the Atari SLM-804 laser. Copyright 1990, Atari Corp.

FS1_02.APP—This Fileselector shell offers versatile access to the file selector on your system. Features include color palette definition and ability to run programs directly from the shell. From Artisan Sofware. *Join The Revolution... Use An Atari Computer!*

FUJIDESK.APP—Places a 3-D spinning Fuji logo in the top left of your screen. Program by Chet Walters of Wiz Works.

HSPD_232.APP—Set your serial port to higher baud rates than 19,200. Especially useful if you have an HST high speed modem or do a bit of null modeming.

MAZ.APP—A one- or two-player maze game. Use joystick, mouse, keyboard or any combination thereof to guide your mice through intricate, randomly generated mazes. Choose from four different games (including a ravenous cat and the bloodthirsty PARANOIA option), four different maze types (Regular, Grid, Invisible and Hidden) and twenty-five different game speed combinations. You can even cover your tracks as you go! *Color Only!* Shareware from J. Weaver, Jr. (author of Michtron's CARDS)!

PAKICE.APP—Allows packing of programs and data files. NOTE: This program doesn't save the original file, it deletes it! Backup the original program before packing it!

QST22DMO.APP—Quick ST 2.2 Demo. Contains mono and color versions and the Desktop Customizer. Order this demo *free* from Branch Always...they'll even supply the disk! This demo is so fast, it beats earlier commercial versions. *Feel The Speed!*

RHOCON.APP—A replacement for the standard Atari Control Panel, this ACC from Germany adds several nice features such as a mouse accellerator and VT-52 terminal emulator built-in. English docs included.

SHREDR.APP—SHREDR Plus v2.0 is the ultimate file deletion utility. When your deleted files must remain private, use Shredr Plus to ensure they are truly deleted. Shareware from Do Not Stamp Software.

SUIZA.APP—Complete Swiss and Swiss Italic font for Calamus. Freeware.

sys_Info.app—Displays TOS ROM version and creation date, total amount of RAM, Free RAM, System Boot drive and more. Shareware from Catspaw Software.

TIEMPO12.APP—A full Tiempo font family for Calamus, with bold, true italic and bold italic. Complete font, shareware.

TLC_BOOK.APP—Powerful address book/date minder. Too many options to mention. *Very Fast.* Another *must have* program by Germany's Tom Hayslett.

XLATE.APP—XLATE is a powerful file conversion program. Any file can be converted to Word Writer ST, First Word or converted ASCII format! X-LATE can strip control characters and even strip out excess spaces (such as indents)!

Readers can purchase the December '90 Disk of the Month from their local AIM Participating User Group or by sending $6 ($5+$1 shipping/handling) to Unicorn Publications, 3486 Braeburn Circle, Ann Arbor, MI 48108.

Please specify the December '90 disk when ordering.

The New

Diamond Back II

Listen to what reviewers are saying:

"DIAMOND BACK is a very powerful, flexible program...excellent manual...highly recommended"

David Plotkin - STart

"The overall winner has got to be DIAMOND BACK...it creates GEM compatible disks at image backup speeds...this is the one I use and I use it a lot...It's Dependable!"

LeRoy Valley & Ron Robinson - ST Informer

"If you own a hard drive...then RUN, don't walk, to your nearest Atari dealer and ask him to order Diamond Back!"

Victor T. Albino - ST World

DIAMOND BACK II provides a TRUE file backup at image backup speeds with more power and flexibility than all the rest combined! Here are just a few of the features packed into DIAMOND BACK: Easy to use 100% GEM user interface with online help * Backup/Restore ANY number of drive partitions, directory paths, single directories, or specific files in a single pass * Flexible creation of backup sets from different paths or partitions * Wildcard masks to include or exclude files * Incremental backups by date or archive bit (TOS 1.4) * Load/Save custom backup configurations * Automatic drive switching * Full or Partial restore * Flexible disk formatting options * File compression & encryption * Disk usage estimation * Backup to floppies or hard disk partitions * Image backup option * Backup Spectre(tm) partitions * Support for high density floppy drives * and MUCH MUCH MORE!

Introducing DIAMOND CACHE! The most powerful disk cacheing program available for the Atari ST. Diamond Cache is fully user configurable and even includes a flexible print spooler.

ALSO AVAILABLE FROM DATA INNOVATIONS

FULL COUNT BASEBALL * COURT SIDE COLLEGE BASKETBALL BASKETBALL, THE PRO GAME * 3 IN 1 COLLEGE & PRO FOOTBALL

If you are a sports lover, these are the games for you! Each game is a statistically based simulation using the actual statistics produced by past and present teams on the field and on the court. Each game comes complete with teams from the most recent season, plus great teams from the past and a stats compiler to keep track of your computer league. If your looking for statistically accurate game play in a sports simulation, these are the games for you!

MYSTERY MANSION

Explore a century-old Victorian Mansion. Find hidden rooms, lost treasure, or maybe the rightful heir to the treasure. Mystery Mansion is an entry level and expert level text adventure! The lower floors allow entry level adventurers to explore, but to leave the mansion you will need luck, and the skill learned on previous levels of the Mansion.

SUGGESTED RETAIL PRICES:
DIAMOND BACK II...$44.95
DIAMOND BACK & DIAMOND CACHE...$54.95
DIAMOND CACHE...$19.95
ALL SPORTS GAMES ARE...$39.99 EACH
MYSTERY MANSION...$24.95

Alamo Area Atari User Assoc.

The Alamo Area Atari User Association (AAAUA) is an Atari 8-bit user group serving primarily the greater San Antonio area. Presently, there are about 50 Regular and subscribing members, some also own Atari STs. We hold General Membership meetings on the first Tuesday of each month at the Balcones Heights Community Center, 107 Glenarm in San Antonio, from 6:30 to 9:30 PM. General meetings feature a presentation of general interest and small group problem solving. Each third meeting we have a swap meet and computer workshop in lieu of the informal presentation.

AAAUA maintains a public domain library of about 700 disk titles as well as a sizable hard copy library of magazines and newsletters. We also hold Special Interest Group (SIG) meetings on the second Monday of each month at the same location and times, on such subjects in which interest is expressed. In addition, we conduct an "Introduction to Atari Computing" class one or two times each month at Atari-ville, our local Atari store, 1015 W. Hildebrand, (512) 736-1405.

Each month we publish (FR)ANTIC, our user group newsletter, covering happenings of local interest as well as other topics, both technical and non-technical. Members also receive a subscription to AIM as part of their member benefits. Dues for family membership are $24 per year or $15 for six months. A "Subscribing" membership is also available for $12 a year which entitles the member to a subscription to AIM and (FR)ANTIC, and access to our P.D. Library. For further information about AAAUA, write to the above address or call Al at (512) 492-6633, or Gino at (512) 826-3689.

Presidential Ponderings by Alvan Sherrill

AAAUA has just become a Participating Atari user group member with this issue of AIM. When I first saw a copy of the magazine, I was impressed. AIM certainly fills a crying need for independant, unbiased reporting on Atari news and views, as well as being a source of information on equipment and software reviews. There is also a need for tutorials and technical information on Atari computing. AIM has great potential to fill these needs that are no longer being adequately covered in other publications. But, to help AIM continue to grow in fulfilling this void, we all must contribute our expertise and know-how.

Let's face it. The Atari computer has been largely abandoned by most computer publications. If we are to continue to grow with our computers, we Atari users must stick together and share what we know and learn. Also, when a large user base becomes known to software and hardware producers, it is more likely they will be persuaded to give us the support that has been so lacking in the past. This is especially true of the CLASSIC Atari 8-bit.

So, user groups throughout the land, let's band together, for in numbers there is strength!

ST Interest Group (STIG)
1st Speaker - Ed Fason - 371-6614
Librarians - Lou Mendoza & Joe Ronda
Scribe - Chet Cox
PictureDrawer - Jeremy Fason

It was a dark and stormy night, and all of the faithful ST users had gathered to attend the monthly meeting. Alas, they lamented, "where is our 'beloved' 1st Speaker Krazy Eddy?". As if on cue, or a little later a wretched looking 1st Speaker wandered in out of the rain. Immediately crushing the aspirations of the rebel librarian Krazy Eddy whipped out his clipboard and started the meeting. Krazy held an impromtu demonstration of ST Data Manager and Publishing Partner. After this masterfully handled meeting we were sent on our way by our 'leader??' into the cold, dark night.

ABLE

The Atari Boosters League East (ABLE) meets monthly with enthusiasts and provides user support for all Atari computers except the Portfolio and PC line. The purpose of ABLE is to advance the knowledge of the membership through mutual education and the interchange of ideas.

General meetings are held in the Palm Magnolia Room at the Orlando Public Library, 101 East Central Blvd., on the last Sunday of each month from 1:30 to 4:30 P.M. ST SIG special interest meetings take place in Room 134 at the Bush Science Center on the Rollins College campus on the second Wednesday of each month from 7 to 9:30 P.M. Ad hoc meetings are scheduled as needed to present speakers, conduct special workshops, provide tutorial seminars and for parties. We assist members in service and software problems, as well as arrange group purchases and discounts.

Information is disseminated to members through our newsletter, the ABLE Atari Information Digest (ABLE AID). A package of twelve selected previous issues of ABLE AID higlighting the "super eight" computers is available for $10 ($5 for members). In 1990, ABLE began participating in the Atari Interface Magazine.

ABLE accepts written correspondence at P.O. Box 1172, Winter Park, FL 32790, while membership inquiries are handled by Hadley Nelson, President, (407) 671-0317 or Milton Eager, Treasurer, (407) 834-0581. Annual dues are $12.

A.C.C.T.

Atari Computer Club of Toledo club members receive, as part of their dues, Atari Interface Magazine and access to the 8-bit and ST public domain software libraries. Disks are $2/8-bit and $3/ST, non-members may purchase disks at a slightly higher cost.

A.C.C.T. meets on the second Monday of the month from 7-9 pm at Bassett's Health Foods, 3301 West Central Avenue (Westgate Shopping Center), Toledo, Ohio. 8-BIT SIG (yes, I said 8-bit) held monthly at the home of Jim Herzberg. Dates and times announced at meeting. ST SIG held monthly at the home of David & Brenda Micka. Dates and times announced at meeting.

From the Prez,

I'm back (again!). We're going to try this again this year. We held our elections last month (October). Many of our membership have wondered just when the h--- this club is going to get off the proverbial ground. Well, I really thought that last year was going to be it, but I was *wrong*. I unfortunately have a job that requires some long periods away from home (I'm writing this from my hotel room in North Carolina), which dumps a lot of things into my VP's lap and then if he's tied up with college stuff then things really go haywire. Sooooo, this year I am going to make a super effort to get the board of directors together soon (November's meeting or thereabouts) to plan (what a concept!) our program for 1991. October was also the month for the ComputerFest sponsored by our friends in the Commadore computer club. A word of thanks to them for the invitation again this year.

We have invited the members of the other Atari club in town to form a joint club that could benefit all, I hope it happen because they have some top notch folks there.

The topic for the November meeting will be computer storage devices, from tape drives to hard drives and how they work for you. November's meeting will still be on the second Monday (the 13th) since there was some confusion as to which Wednsday we wanted to change to (was to have been voted on last meeting) so come one come all and help me get the ball rolling. Until next month.

ACORN

Atari Computer Owners of Rochester New York

The Atari Computer Owners of Rochester, NY (ACORN) meets on the 2nd Wednesday of each month. For the months of August and September, the group will meet at Sunset Recreation, 1317 Chili Avenue, in the town of Chili. (For all you out-of-towners reading this, that is pronounced Chi-lie). A vote is being held to determine a permanent meeting place.

At the August 8th and September 12th meetings, we will have our normally scheduled STarter class for the ST which meets at 6:45 pm, and a Basically Speaking class for the 8-bit which starts at 7pm.

ACORN operates a BBS at (716)436-3078 with 40 megs of public domain downloads for the 8-bit and ST systems. Our mailing address is POB 23676, Rochester, NY 14692.

Dues are $18 per year which includes access to the club's PD libraries, enhanced access to our BBS, and subscriptions to our newsletter. the ACORN Kernel and to Atari Interface Magazine.

Atari Computer Owner's Resource Network

ACORN, the Fort Wayne area Atari users group, meets at the Georgetown branch of the Allen County Public Library on the first Saturday of each month beginning at 10 AM. Annual membership dues are $18 which includes access to our library of 8-bit and ST software, magazines, books, and hardware; member's privileges on the BBS; the monthly newsletter; and a membership card good for discounts at some of the local stores.

Eric Converse	President
Scott D. Schaffer	8-Bit Vice President
Scott Sorg	16-Bit Vice President
Kim Stahn	Treasurer
Karl Fadus	Librarian
Ken Helms	Secretary/Newsletter Editor
Our BBS	(219) 744-1396

CALENDAR: The November meeting has been cancelled. The next regular meeting will be December 1st. The first meeting in 1991 will be January 5th.

Minutes of the Last Meeting: With the ICE conference the last Saturday in October and Pentacon on our regular meeting day in November, it was voted to skip the regular meeting in November. It was also voted to restructure the meeting agenda to combine 8-and 16-Bit demos, keep them short, and leave more of the meeting time "unstructured." Bob Kelley demonstrated WordUp 3.0.

Plans for Upcoming Meetings: The focus of the December meeting demos will be graphics. The January meeting will be our usual after Christmas Gamefest. Come and join the fun.

B.R.A.C.E.

Bluegrass Region Atari Computer Enthusiasts

B.R.A.C.E. (Bluegrass Region Atari Computer Enthusiasts) meets the third Sunday of each month from 1 - 4 PM. Current membership dues are $15 per year for an individual membership, $20 per year for a family membership and $10 per year for an associate membership. (An associate membership includes receiving the monthly newsletter, but excludes the use of the library.) Members of have extra privileges on The Abyss BBS (606) 223-2782.

President	Hal Nason	(606) 269-8989

ATARI FEDERATION

Regular meetings are held at the VAFB Federal Credit Union, Vandenberg Village, Califorina on the first Monday of every month at 7:00 P.M. Dues are $10 for individual or $15 for family membership. The Atari Federation maintains a PD software library for both 8-bit and ST computers.

President	Phil Rominger
Vice President	Bob Ribortone
Secretary	Matt Matias
Treasurer	Herb Kanner
Newsletter Editor	Jerry Sullivan

Happy Halloween Trick or Treat wipe your feet

No one is home right now so leave your name, opps wrong place. Anyway we had a good meeting on the 8th, people showed up and everything. Phil started off with all of his news from the Atari world some good some some not. Next we took a break and everyone milled arround for a while. Then we were called back to order(?) so the demos could start, Paul Alhart avid 8-bit fan shoued us one of his favorite utilities, the name of which I can't rember right now, but it was real neat (Paul said so) and we have a copy in the library. This program will fix missing/messed-up data tables. For the ST folks a head to head comparision was made between Quick ST2 and Turbo ST, we found Turbo ST faster (with Mike running the stop-watch) but Quick ST2 came with some utilities that Turbo ST didn't, so it all depends on what you are looking for, to quote one club member " 6 of 1 1/2 dozen of another". It was not too long after this that the meeting ended with more milling and mingleing outside after the bank closed.

Please remember NOVEMBER 5th is ELECTION day come to the meeting and VOTE.

Birmingham Atari Computer Enthusiasts

The Birmingham Atari Computer Enthusiasts of Birmingham, Alabama meets at the Vestavia Hills Library downstairs at 7:00 p.m. the second Monday of each month. Membership dues are $20 for a regular membership,and $35 for a professional level membership.

Mark Bodenhausen	President
James Gilreath	Vice President
Brenda Bodenhausen	Secretary
Steve Yates	Treasurer

For membership information, contact Steve Yates, 1005 Candy Mountain Road, Birmingham, Alabama 35216.

Our BBS is at (205) 833-5012. This is both a voice and data line. To access the BBS, press 1 after the first ring. For voice, press 2. After 6 rings, 2 is automatically selected.

BRAG ST

Buffalo Region Atari Group for ST's

BRAG ST was founded in 1987 to serve Atari ST owners in the Western New York area. General Membership Meetings are held on the third Thursday of the month at Erie Community College North Campus, Room S-105 in the Student Center. Setup begins at 7:00 PM; Meeting starts 7:30 PM. The Board of Directors meet on the the first Tuesday of the month at the Your Host Restaurant, Harlem at Sheridan at 7:30 PM. All are welcome to attend. Piracy will not be tolerated at any BRAG ST function.

BRAG ST, PO Box 1035, Buffalo, New York, 14225

Chairman	Mark Pierro	(716) 691-7844

CACE

Cascades Atari Computer Enthusiasts

Cascades Atari Computer Enthusiasts is the Atari Club in and around Jackson, MI. The CACE BBS is run by the club and open to everyone. The number to call is (517) 764-4047. Current membership dues are $14.80. Any written communication with CACE should be sent to PO Box 6161, Jackson, MI 49204. Our meetings are held on the second Saturday of the month fro 1p.m. to approx. 4p.m. at the Boos Recreational Center. For more information, contact Brent Fisher at (517) 764-4599.

Central Connecticut Computer Club

Well hi! Still here as you can see. Sepember meeting came off good. Joe Mirando brought the 1040STe and his own machine with P.C.Ditto II installed and working. Joe ran us through a quick guided tour of the (shudder) IBM system as we all watched.

I ripped off some parts of my wife's stereo system for the next demo. Yup...hooked up the 1040STe to a 120 watt Kenwood system that just happened to be sitting in my garage. Sounded great, the game Joe demoed on the STe was Dragons Lair done by Don Bluth whose last acheivement was Space Ace.

Meeting progressed to discussion of WAACE show and who was going. Gary (Too Tall) Jones was going to try to go with video camera and maybe Joe Mirando. Also, If anyone knows the phone number to the 8-bit club in Hartford, drop me a line....I have letters from prospective members for them.

OK...that about duz it. Next month...The Battle of Britain, and hopefully a showing of a " production" NeoDesk 3.

Yankee "no longer on GEnie" Rich, Prez!

CDACE

Capital District ATARI Computer Enthusiasts

Who We Are: Capital District Atari Computer Enthusiasts (CDACE) is located in Albany, NY and serves the tri-city capital region. Meetings are currently held on the third Tuesday for the XE group and the last Tuesday for the ST group at the Computer Cellar, Westgate Plaza, Albany, NY. Meetings begin at 7 PM with the libraries available starting at 6:30 PM. Dues are currently $20 per year for each family. This includes a subscription to AIM, our monthly newsletter and our BBS. Membership is not required to visit a meeting.

CUSTUG

Champaign-Urbana ST Users Group

The Champaign-Urbana ST Users Group (CUSTUG) meets at 7pm on the second Wednesday of each month in the Auditorium of the Urbana Free Library at the corner of Elm and Race in Urbana, IL. Membership dues include a subscription to AIM and GLITCH and use of the commercial lending library. New members are welcome. The group supports a local BBS, Blackhawk's Keep, operating 24 hours a day at 3/12/2400 baud (1/8/N): 217-892-5512.

Henry Murphy	President
Jimmie Myers	Vice President
Jim Linder	Secretary/Treasurer
Tim Brumleve	Librarian

C.O.A.C.

Central Oregon Atari Club

Dedicated to Central Oregon Atari Users and Enthusiasts Since 1986

President	Norman Moore	(503) 447-3598
ST-VP	Bob Kanski	(503) 548-8201
8-Bit VP	Marc Hitson	(503) 648-0513
Treasurer/Editor	Glenn Dulin	(503) 382-3956
Secretary	Nancy Kanski	(503) 548-8201

Address: Central Oregon Atari Club, PO Box 6824, Bend, OR 97708

Membership dues are $1/month and $1/year for each additional family member. We meet every second Saturday of the month at 5:00 PM at the Ann Rita Conference Center, which lies just in front of the St. Charles Hospital on Neff Road in Bend.

If you look at the calendar perhaps you will notice that December is fast approaching, and that means it's... ELECTION TIME. Oh Boy! I know everyone is excited about that. We need everyone's help and input during elections so that we can choose just the right persons to fill our high offices. People who embody the high standards and helpful traditions of our club. (It's get'n deep here) People who can give us forthright leadership. People who care beyond the call of duty. People..... who. Well, maybe we're asking too much! Come to the meeting anyhow, we do give away things and we have a good time.

Thank you Nancy for bringing the goodies to eat. Your fruit cakes were delicious.

We did give away some things. Bob Kanski won a T-shirt. He had to give it to Nancy though, it wasn't quite big enough. Marc Hitson won a game for his 8-bit. Yea! Marc. It seems the odds are pretty good for the 8-bitters, there were only two there. 50/50 ain't bad. We decided to go ahead with the purchase of the Migraph Hand Scanner. Some members are pitching in $25 each and the club will pick up the rest. The unit will then be rented out to members. No rental rate has been set yet, but it will have to reflect the cost of the unit and return a profit to the club.The total cost is $250, something no single member has enough need to invest in.

We had a good turnout for the October meeting, good seeing you all. We may not be a big group, but we are a pretty happy group. December marks the beginning of our 5th year. Happy birthday COAC! And thank you members.

See ya latter dudes...glenn

FACCS

First Atari Computer Club of Spokane

We currently own and maintain a 24-hour Bulletin Board System (BBS), open to everyone with a 300, 1200, or 2400 baud modem, called the Atari Zone. To enter the Atari Zone call 509-326-5741.

Since we currently have renewal dates scattered throughout the year, please check your card for your current expiration date. Remember, once your membership expires we are no longer able to send you your AIM Newsletter or allow you to remain at the F.A.C.C.S. level on the Atari Zone. To prevent any interruption in your F.A.C.C.S. services please renew by the expiration date on your card.

BBS Number		(409)722-6526

Congratulations to all the officers and thanks to last years group. May we all have a fine year in the GTAUG! The GTAUG has been 'around' since 1981 and supports both the 8-bit and 16-bit communities. Meetings are held the first Tuesday of each month at a location announced in the previous meeting.

At present our dues are $24 per year (Our year begins in September.) and is pro-rated at $2 per month for new members the first year. Since our nearest dealer is 90+ miles away, it is imperative that we support each other. It is for this very reason our group is a fairly close and diverse. We support all facets of Atari computing from 8-bit to Spectre/Mac to IBM and MIDI.

HACE

The Houston Atari Computer Enthusiasts meet on the fourth Wednesday of the month, 6:45pm at the Health Economics Corporation, 2400 West Loop South, in Houston, Texas. The club supports all Atari computers from the 400 to the Mega4.

Membership is $22 per year, and gives full access to our BBS (713) 458-9923, access to our disk, magazine and newsletter libraries, a subscription to AIM, and our local news journal UPDATE ATARI. There are also other benefits, such as store discounts, door prizes, workshops, telephone help when you have problems, and much more! For more information, please contact one of our officers or drop us a line!

HACE, P.O.Box 460212, Houston, TX 77056

President:	Bill Kithas	713-855-0815
Vice President:	John Hauser	713-458-0595
Secretary:	Bob Leeper	713-665-3229
Treasurer:	Jim Salmon	713-879-8119
Newsletter Editor:	Tracy Webber	713-981-5343

JACS

Jersey Atari Computer Society, P.O. Box 710, Clementon, New Jersey 08021. JACS BBS: (609) 346-1224

The Jersey Atari Computer Society (JACS) provides a forum through which members may further their understanding and enjoyment of all Atari computers, through the exchange of ideas and information with other users.

JACS holds two meetings per month at the Camden County Library, across from the Echelon Mall in Voorhees, New Jersey. The executive meeting, where all the planning for the club takes place, is held in the 2nd floor meeting room from 7-9 PM (meeting dates vary from month to month). The regular JACS meeting is usually held on the third Tuesday of each month, in the 3rd floor meeting room from 7-9 PM.

President	Mike Hopkins	227-9058
ST Vice President	Maureen Kelly	428-9381
Treasurer	Forrest Blood	877-3579
Recording Sec'y	Gary Mickus	767-1933

Layton ACE of Utah

The Layton Atari Computer Enthusiasts (L.A.C.E.) membership cost $20 per year. Privileges include the AIM Monthly Magazine, access to the 8-Bit and ST club libraries, monthly meetings, help and friendship. If you are presently not a LACE Club member and wish to join contact the one of following persons or write to LACE, c/o Irwin Brooks, 3897 So. 2275 W., Roy, UT 84067-3515.

Irwin Brooks,	President/ST Librarian	(801)731-1516
Richard Clark,	Vice President	(801)825-5823
Ken Karchner,	Secretary/Treasurer	(801)776-8015
Lonnie Allen,	8-Bit Librarian	(801)392-4450
Kelly Knecht	ST Librarian	(801)773-5652

The L.A.C.E. Club Meets in the basement of the Clearfield Library every second Wednesday of the month at 7:00 p.m.

Mark your calendars for the next meeting: December 12, 1990.

LBACE

The Long Beach Atari Computer Enthusiasts meet on the second Sunday of the month at 6:00 pm. Meetings are held at Mercury Savings and Loan on the corner of Long Beach Blvd. and Carson in Long Beach. Address is PO Box 92812, Long Beach, CA 90809.

President	Richard Hull	(213) 422-1055
Vice-president	John Saunders	863-2582
Treasurer	Pat Connelly	
LBACE BBS		498-8824

Club dues are $20 annually. The club supports both the 8bit and ST. Members have access to the club's PD library and BBS and receive a year's subscription to Atari Interface Magazine.

M.A.C.E.

The Michigan Atari Computer Enthusiasts

Members of MACE receive, as part of their dues, Atari Interface Magazine. Members are also entitled to purchase disks from the 8-Bit and ST public domain software libraries. 8-Bit disks are $3 each, and ST disks are $4 each. As an added bonus, if you purchase three (3) disks from either library you will receive a fourth disk of your choice at absolutely no cost. Non-Members may purchase disks at a slightly higher rate. Mail order is also available.

For a catalog of current disks in our libraries, send $2 to:
MACE, P.O. Box 2785, Southfield, MI 48037

MACE meetings are held on the Third Tuesday of each month at the Southfield Civic Center at 7:30pm. The Southfield Civic Center is located at 10 1/2 Mile and Evergreen Rd, one half mile south of the Evergreen exit on the new I-696. Meetings are in the small pavilion, room 115. Parking is available in the parking garage below the pavilion or in one of the many parking lots on the Civic Center grounds.

If you have any problems with getting to the MACE meetings, please feel free to call on a MACE Officer to relieve you of your confusion. We are always glad to extend a helping hand!

Please come and join us! We are awaiting your visit!

M.A.C.E. MEETING MINUTES -- SEPTEMBER 1990

President Ed Hanson called the September meeting of MACE to order at 7:55pm. Bob Retelle got things rolling with the latest word from Atari, and continued by showing off the AIM disk of the month, as well as a disk of Tiny format cartoon pictures donated by Bill Boles and a disk of games donated by another member. After this, our regular Q&A session was held.

Next up was the main topic for the evening.... ELECTIONS!!. After much begging and pleading, the following chumps (Er... persons) came forward to take command:

President—Ed Hanson; Vice-President—Ted Newkumet; Meeting Coordinator—Jon Bailey; Recording Secretary—Mark Tappen; Membership Officer—Bill Boles; Treasurer—Jim Nichols; Coresponding Secretary—Mark Tappen; ST Disk Librarian—Bob Retelle; 8-Bit Disk Librarian—Ray Simmonds; Newsletter Editor—Jon Bailey. A well deserved thank you to all of our new officers. After elections, the members took a 10 minute break. Finally, to close the meeting, Jon Bailey gave a demo of the Instant Graphics program. The meeting was called to a close at 9:30pm.

MID-OHIO ATARI USER GROUP

Mid-Ohio Atari User Group Post Office Box 134, Ontario, OH 44862

The Mid-Ohio Atari User Group supports all models of Atari computers. We meet at A&B Computers, located in the West Park Shopping Center on Park Avenue West in Mansfield. Meetings are held the third Saturday of each month from 7:00pm to 9:00pm. Demonstrations are welcomed and pirating is expressly forbidden.

MAUG is a participating club in the Atari Interface Magazine. As such, members receive an issue of A.I.M. each month for no extra charge. Club dues are $7.50 per year for residents of Ohio, and $10.00 per year for others. A monthly disk subscription is an additional $3.00 per year if you pick your disk up at the meeting. Disk subscriptions which must be mailed are an additional $24.00 per year.

The club maintains a disk library for both the 8-bit and ST computers. The library disks are made available at each meeting. There is also a message base on the DataQue Support BBS members to use. Anyone wishing to become a M.A.U.G member can contact Chuck Steinman at the club address or call the DataQue Support BBS at (419) 529-5197 and leave email to the SysOp.

Middle Georgia Atari Users Group

M.G.A.U.G.

The Middle GA Atari Users Group is the sole Atari Club in the Middle Georgia area. We are composed of 60 members of which approx. half are ST users. Club president Pete Miller can be reached by phone at 912-328-8758. The MGAUG address is 115 Feagin Mill Rd., Warner Robins, GA 31088. MGAUG meets the second Sunday of each month at 1 PM at the Warner Robins Library. Annual dues are $5 with the newsletter optional. Use of the club library is free to all paid members.

October Meeting—The October meeting kicked off at the usual time. Turn out was good with three members from the Atlanta ST users group including their president showing up at the meeting. We are glad that they decided on the 100 mile trip to attend our small meeting. Bob Blackshear was nice enough to bring his computer to the meeting which was a boon in that we had some lively discussions.

Atari has a lot of things on the horizon but whether that will help Atari U.S.A. is still a toss-up. The TT is supposed to shipping at this time with the 32Mhz clock instead of the 16. It will also have an extra bonus in a new desktop that has a lot of features found in NeoDesk.

Speaking of NeoDesk, Atari Canada, is offering several bundles of software including NeoDesk. The Atari CD ROM has finally been released to the puclic for under $600. Two Atari disks have been released including a disk of Public Domain software and a disk of Clip Art. Atari is also selling a 520STe in Europe, no news if or when it will be offered in the U.S. Atari is also marketing a new monitor to take care of the STe's sound. The new color monitor will have stereo and is an entirely new monitor.

On the software front we have some new software that promises to be a boon on the Atari front. M1 Tank Platoon from MicroPose will be released soon and should be a must have for Strategy gamers. For Wargamers there are two new releases that may be of interest, Universal Military Simulator 2 and Halls of Montezuma are for hard core Wargamers only.

We had the drawing for ACCESS at the meeting and Jeff Vincent was the lucky winner. Another ACCESS program will be given away at the November meeting. You MUST be at the meeting and be a payed up member to qualify for the drawing. Jeff was also nice enough to bring his new game BATTLE OF BRITAIN from LucasFilm to the meeting. Also at the meeting was LEE MAVITY with his new 85 Meg hard drive from D&P Computers. The hard drive featured an under the monitor style case and has a clock, fan and room for an additional drive. All this for a under $600 -- a great price. If you are thinking about a hard drive you may want to give D&P a call.

The next meeting will be on December 9th at the library at 1 PM. I hope to see you there and Why don't you bring a friend.

N.A.U.G.

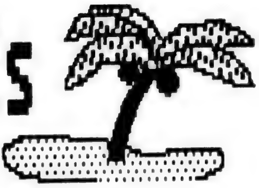
Nashville Atari User's Group

Nashville Atari Users' Group P.O. Box 121752 Nashville, TN 37212

NAUG meets on the third Thursday of each month from 7PM to 10PM at the Cumberland Museum and Science Center. Membership dues are $24 per family for the entire year. With your membership you will receive our local newsletter, Atari News, a subscription to Atari Interface Magazine, access to the club's 8-bit & ST Public Domain/Shareware libraries, any group discounts on products, and entrance to all club related functions. We have an Associate Membership for $12 per year. With this membership, you will receive Atari News, AIM and access to our 8-bit & ST PD/Shareware libraries. People joining during or after the month of July pay 1/2 the yearly rate. Visitors are welcome to all meetings.

President & Editor Walt Sullivan (615) 228-7353

O-ACEs



O-ACEs is a non-profit group interested in getting more out of Atari computers. We are NOT affiliated with Atari Corp. or any other commercial organization -- we are there for YOU! We cover BOTH 8-bit (including the 400/800, XL, XE, and XEGS series) AND 16-bit (ST series) Atari computers. We meet twice each month (except November and December) on the 2nd and LAST Wednesday each month. Doors open by 7:30 pm at La Vista Recreation Center, 8116 Parkview Blvd. (just off 84th Street, south of Food-4-Less and east of 84th at the light)

FIRST MEETING: (2nd Wednesday) Covers news, views, and decisions that ALL members might be interested in. FOCUS MEETING: (LAST Wednesday) Concentrated information on a single topic (such as word-processing, spreadsheets, music composition, desktop publishing, etc.)

Call 592-5427, for more info on O-ACEs!

PAC

Annual Dues $25.00

Newsletter ONLY (year) $10.00

The Portland Atari Club with the Original Eugene Atari Computer Enthusiasts

Portland Atari Club and the original Eugene ACE

President	Paul D. Gittins	503-667-2403
Vice-President	Ben Smith	
Sec. Treasurer	Mel Anderson	503-232-7231
Membership Sec.	Paul Karczag	503-256-4199
ST Disk Librarian	Randall Leong	503-246-6354
8-Bit Librarian	Jon Johnson	
Sargeant at Arms	Dutch Leanard	
ACE of America		503-285-4417

We of the Portland Atari Club are very excited at becoming members of AIM. PAC is one of the oldest Atari clubs and still has active sections of both 8-bit users and ST members. We currently are available through the ACE of America BBS at 503-285-4417 operating on 300/1200/2400 baud. Club meetings take place the first Monday of the month at the Northwest Service Center on NW 18th and Everett. All are welcome. Meeting time is from 7 pm till 9:30 pm.

By the time you read this we will have completed the elections for the new board and they will be anxiously looking forward to their terms of office for the new year. Many of the board positions are going to be filled by current members and perhaps we can look forward to some new blood as well. After serving as President for the last few months I can honestly say that I am looking forward to a rest. For the coming year I will be serving as Advisor, a post usually filled by the outgoing President. Let me take a moment to thank all of you for the support you have given me and for what I consider a successful term.

For the coming meeting in December we are planning a Christmas party. PAC will supply the beverages and it will be a pot luck. The only rule for the pot luck is if you plan on eating be sure you bring something to share. We will also have a raffle and give away something nice. We don't know what just yet, but I'm sure we can find something good. Let's take a few moments to invite all your Atari friends and family for a good time.

I would also like to invite all the dealers and marketing people who would care to come. In particular we would welcome the people from Supra Corp., Branch Always Software, and Migraph. I believe the people from Diamond Back also are our neighbors and they are certainly welcome. If you are near or far and would care to join us please feel welcome.

PORTS ATARI P.A.C.E. COMPUTER ENTHUSIASTS

President	Tracy Hendershot	525-1058
Vice President.	Larry Nadeau	525-7430
Sec/Treasurer	John Zupansic	394-9326
STLibrarian	Don Henricksen	729-6309
8bit Librarian	Gary Armbrust	729-6906
ST Coordinator	Geoffrey Bennett	722-3354
8bit Coordinator	Aaron Potopinski	525-1058

Membership to PACE is $30.00 per year or $9.00 per quarter. General meetings are held at 6:30pm on the third Sunday of every month. In the event of a holiday, a new date will be chosen and will be posted within the pages of this newsletter and on local Bulletin Boards. Membership includes a monthly newsletter, monthly meeting, FREE Disk-of-the-Month, access to our BBS, FREE printer ribbon re-inking, and FREE copying priveleges to our VAST collection of 8/16 bit Public Domain programs. Ports A.C.E. is an alliance of families with a mutual interest in the Atari Computer and is an independent, non-profit organization. PACE hardware assets: 130XE, 1050 Drive, MacInker and a Supra 300 baud modem. Any written correspondence should be addressed directly to Ports A.C.E., Tracy Hendershot, 4835 Crosley Avenue, Duluth, MN 55804.

From the President...Is that snow I see outside? Standard equipment to have in the house during a "white alert" is your 8bit/ST, a good word processor, spreadsheet and game! This Christmas, make an effort to support your favorite shareware author, or buy that long sought after software package, just to let the world know that Atari supporters still use their machines and purchase software. Do it!

We've received a few items of interest in the mail this month. Soft-Logik's newsletter describes its new releases for the Amiga (ha!). MiGraph sent an interesting proposal to user groups. For $250, they will send us a single MiGraph Handscanner and TouchUp software bundle for the ST. Also, they are calling on "All Atari Pirates!" For $79.95, they will send you a legitimate copy and manual of their TouchUp software, provided you mail them your pirate copy. Hmmm, I might be missing something here, but couldn't you copy TouchUp easily? The protection was that without the hardware key, the program was rendered useless. I have information on an Atari 8bit to IBM PC connector that allows your 8bit to access stored Atari programs on yes, your PC hard disk!

Our club couldn't be running smoother. Our AIM subscription has been a rousing success. New members are joining and interest is again mushrooming, finally! The meetings will be held at the Androy Hotel in Superior, WI for now. Robert Whiffen will be your host. See you November 18th!

PHAST - Phoenix Area ST

The PHAST monthly meetings are held on the second Saturday of each month at 8640 N. 19th Ave., Phoenix, Arizona from 9am to 12pm.

The Prez Sez by Rick Reaser

For some reason, the article we submitted in August for the September mailing of the October AIM didn't get printed. Hopefully, these comments which I am typing in the middle of October will be printed in the December AIM. I will repeat some of the things you might have missed in the missing October AIM article.

The new and improved LASERNET BBS (591-4620) is now up and running wit TurboBoard. It is *HOT*, so check it out. We post Club News and so forth on the board. For those of you who haven't heard, Computer Express! has folded and the 8-bit and ST public domain libraries are now at the Citadel Computer store on 1860 S. Nevada, behind El Pollo Asado. The Citadel Computers near the Citadel Mall is up and running now. They have ST hardware and software in this location now. Two British ST magazines (with disks) have been a hit there. Support your local retailer.

Our annual picnic was a moderate success. Twenty-six people attended in all. The weather was fabulous. The publicity was not. You probably received the flyer for the picnic a week after the picnic. We mailed it in a month and a half before then. In the future, we will be mailing time sensitive stuff out ourselves, direct to the membership, as well as posting it on LASERNET. Here are some things to mark you calendar with, if the December AIM gets mailed on time. First, the November ST SIG will meet on the fifth Thursday, 29 November at the normal place. The fourth Thursday is Thanksgiving. Second, the December 8-bit and ST SIGs are combined for our annual election meeting/party. Both SIGs will meet on 4 December which is the 8-bit SIG meeting day, at the normal place. We will send a direct flyer out for both of these events, in case something goes wrong with AIM.

Here's the update on SIG happenings. At the June 8-bit SIG we demoed Atari Artist with the Touch Tablet, Atari Graphics with a Light Pen, Rambrandt, Diamond Paint with an ST mouse and several public domain graphics programs which are in the Club library. The October 8-bit SIG was essentially rained out. The troops were directed to go to Dave Koster's house after assembling at the Mall. Sorry, if we missed you. We didn't want to risk carrying our computers through the rain. Since Steve Leser was sick, the July ST SIG was led by fearless Dave Koster. Most of the time was spent looking at Aquanaut and some Dr. T. demos.

The September ST SIG highlight was the demo of TOS 2.0. It was very fast, but it did require a few workarounds. Hope to see you at the next SIG meeting.

Rushmore Atari Computer Enthusiasts
(RACE)
3512 Lawrence Dr. Rapid City,
SD 57701 (605) 348-6331

The Rushmore Atari Computer Enthusiasts is a nonprofit organization of Atari computer owners not affiliated with Atari Corp. Meetings are held on the third Saturday of each month, 2pm, at the Westminster Presbyterian Church. Annual dues are $12 for basic membership and $15 for membership and newsletter. RACE offers the Black Hills Atari owner hardware and software support and the largest library of public domain Atari software in the state of South Dakota.

NO PIRACY WILL BE TOLERATED AT ANY RACE FUNCTION!

President	Rick Burton	(605)-642-5353
V. President	Gregg Anderson	(605)-348-6331

R.A.C.E.

Hey gang! I hope that you are enjoying Atari Interface magazine. It seems that most of the people in the club really enjoy receiving it every month. Switching to the magazine did cause certain problems with our club though. Because of the lead time that's involved with producing a magazine such as this, we are unable to inform you of the next club meeting in a reasonable amount of time, and we can't even tell you about the happenings of our last club meeting. If you want to know when the next club meeting is, simply call 851-5134 (Eric) and a message will be posted telling you about the next meeting. The officers of the club will also call all of the members about 1 week before the meeting to remind you when the meeting is.

The Atarifest was a great success this year. R.A.C.E. took 21 people while A.C.U.S.O.F.t. from Fayetteville took 4 members. Combined, the clubs easily spent over $4,000! There was so much to see, so much to buy, and so many people to meet. Many club members got to meet Bob Brodie, John Townsend, and Ken Bradenshire from Atari Corporation. Elie Kenan was present as well. There were numerous vendors and 2 of the vendors had the TT on display!

I could go on for many pages about the happenings at Atarifest but I just don't have the time to do it. I'm in the process of planning for our October meeting which will feature Mac emulation via Spectre GCR and the 1040STe. This meeting will be designed to impress the public since the public has been openly invited. A public announcement spot is being aired for us by WRDU 106.1 FM, an advertisement in the News & Observer has been placed, an editorial in the North Carolina State University newspaper is being run, flyers are being posted, and even the Mac users groups in town are being invited. Hopefully, we'll have a decent turn out.

I hope to see you all at the next club meeting. Give me a call to find out when it will be held!

ROCKFORD ATARI COMPUTER CLUB

WE'RE NOT JUST PLAYING GAMES ANYMORE!

Rockford Atari Computer Club is comprised of avid, dedicated users of all Atari computers. We support and promote the use of 8-BIT, and ST/MEGA machines with extensive PD libraries, monthly meetings, and semi-regular SIGS.

We have had a change of meeting place this year, as our previous site is being used for adult education on Saturdays. We may be able to secure a regular space there, if we can agree to meet at some other time/day (possibly evenings?). Any suggestions, or other alternatives should be mentioned at the meeting. Our regular business meeting is held from 9am-12:00 noon, the third Saturday of the month.

We have accepted the gracious hospitality, of the Springbrook Congregational Churches as an alternative meeting place. It is located, off Alpine, just as you make the turn onto Springbrook road, from Spring Creek road. Our mailing address is 3902 15th Avenue 1 - Rockford, IL 61108. Our phone number is [815] 397-5316.

South East Valley Atari Connection meets the third Saturday of each month at 10 AM at 3234 S. Fair Ln. (Eaton Business Park, just off of 48th Street and Southern), Tempe, Arizona. Yearly membership is $12.00. Membership includes reduced prices on PD ST and 8-bit libraries and monthly newsletter. Club officers are:

President	Tim Barr	(602)821-1200
Vice President	Marc Dyer	(602)897-0314
Treasurer	Lee Whiteside	(602)962-9415
Secretary	Blaine Nelson	(602)964-1949

San Diego Atari Computer Enthusiasts

General Meetings are the 3rd Monday of each month at North Park Recreation Center Social Room, 4044 Idaho Street at 7pm. ST/8-bit workshop meetings are held on the 1st Thursday of each month at North Park Adult center, 219 Howard Ave at 7pm. All meetings are open to the public. Annual membership dues are $18 which includes increased BBS access time, AIM subscription and reduced rates on the Disk of the Month. SDACE's address is PO Box 900076, San Diego, Ca 92190.

President	Richard Betson	(619)630-5869
Vice President	Mike Bergman	(619)558-7866
Treasurer	Nancy Rivers	
Disk Librarian	Marc Lawson	
Chief Wizop	Michael P. Odegard	
Editor/Co-Sysop	Steven Kiepe	(619)549-3207
BBS - 24hrs, 300-2400 baud,68MB		(619)689-8157

During our September general meeting, 6 lucky members were able pick up their TOS 1.4 chips, courtesy of ATARI's user group coordinator, Bob Brodie. Bob visited SDACE back in June and offered to donate the chips as door prizes. Richard Betson picked up the chips from Bob at the HACKS ATARI computer show in Glendale during September. Congratulations to all winners.

The October general meeting announced upcoming elections for SDACE officers, to be conducted in November. By the time you read this, the SDACE reins may have been turned over to some new volunteers. Although the club size has stabilized around 100 members, over 3 times that many attend meetings or use the BBS. Hopefully we can get some of these "unencumbered" individuals to join in the support and direction of the group. To this end, SDACE will be kicking off a major membership recruiting drive over the winter months.

In December, SDACE will hold it's annual Christmas party vice the regular general meeting. There will be food and drink for all, and drawings for software/hardware prizes. We cordially invite all SDACE members to join us for this event.

The date for the SDACE ATARI swapmeet is still being considered. Due to the anticipated large number of items to be made available for swap/purchase, we are looking for another location to hold it in vice the North Park recreation center. The location and date will be passed to members as soon as possible.

In November, SDACE will participate in the San Diego Computer Fair. As a participating user group of the San Diego Computer Society, this is our opportunity to demonstrate to the IBM and Macintosh owners the exceptional power and ease of use of ATARI machines at DTP, word processing, games, CAD, MIDI, and multitasking in IBM and ST modes or MAC emulation. We usually draw a lot of looks of disbelief as the unfamiliar visualize the capability of our "game" machines.

Support your local user group and dealerships!

STANCE

President	Claudette Tishcler	226-5644
Vice-Pres	Gary	521-2855
Treasurer	Kathi Koenig	892-0881
Newsletter Ed	Joseph Adato	449-6881
Disk Librarian	Barbara Carlstrom	371-2732

The ST Atari North Coast Enthusiasts (STANCE) is an independent, not for profit Atari computer user group and is not affiliated with Atari Corporation, or any of its affiliates, in any way.

$12.00 per Year with a one time sign up fee of $13.00.

STANCE club meetings are held every third Monday of each and every month at B & G Electronics, (located at 15729 Madison Ave., Lakewood, Ohio 44107) starting at 7:15PM

SAGINAW/TRI-CITY ATARI USER GROUP STAG

The Saginaw/Tri-City Atari User Group meets the last Saturday before the 18th of the month, at 9am, at the Rudy Zauel Memorial Library, on the corner of Center and Shattuck in Saginaw Township.

President	Bryant LaFrenier	(517) 835-2234
ST Librarian	LeRoy Valley	(517) 686-6796
Tres./Sec.	Marty Schmidt	(517) 792-6029
8bit Librarian	Ted Beauchamp	(517) 686-8872

Club dues are only $20, which provides support for both the 8bit and ST, and fill access to the club's Public Domain library, along with a year's subscription to Atari Interface Magazine.

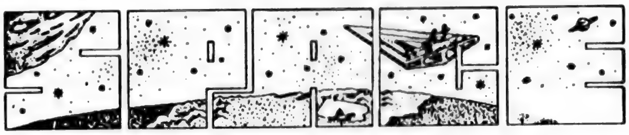
OCTOBER MEETING: We had 8 people show up for the October meeting. The 'postcard reminder' system has been getting praise from our members. I will keep sending those reminders and hopefully pick up some new members. If anyone wants a particular disk in our PD library, they should fill out a form for LeRoy at the meeting (or call before the meeting) and LeRoy will bring your requested disks to the next meeting. A hardcopy list of the catalog will also be present at all meetings. As an incentive, all new memberships and renewals will be accompanied by a free PD disk of your choice from our library.

Games was the topic of the month. Starflight was demoed by Neil Demo at the meeting. Al Jennings could not get Space Ace to run on any computer but his. Two programs, Altered Beast and Shadow of the Beast, were two fanastic high-res games for the ST. Fun was had by many especially with the surprise appearance of the STACY. NOTICE: There is a possibility that the TT might make a surprise visit to a STAG meeting in the near future.

NOVEMBER 17th MEETING: Hard drive meeting: The group will have a hard drive tutorial meeting for the ST. ICD Utilities, Cache programs, dissections of a LIVE hard drive are some of the many activities that will be directed by LeRoy Valley at the meeting.

EQUIPMENT VOLUNTEERS for November 17th are LeRoy Valley with his ST and hard drive and Bryant LaFreniere with his monitor and hard drive.

FUTURE MEETINGS:The December 15th meeting will feature our annual swap meet. Also, remember that a January appearance at the Fashion Square Mall in Saginaw by the STAG group is a possibility so I will be looking for volunteers to be at the booth during that special weekend.



All meetings will be held at the Camp Hill Shopping Mall Community Room until further notice. Currently all dates are set for the 3rd Monday of the month.

ST☆R
ST ATLANTA ROUNDTABLE

STAR (ST Atlanta Roundtable) meets at Shoney's at 6551 Peachtree Industrial Boulevard at 7p.m on the Third Monday of each month. Membership dues are $15 per year. Each member will receive a copy of AIM and a new PD Disk is available each month. For membership info contact Ed Cadow, Claude Brewer Rd, Loganville, GA 30249 or (404) 466-0014.

ST CLUB EL PASO

The Atari ST Club of El Paso is the only official Atari ST user group in the El Paso southwest. Meetings of the ST Club are held once a month at the Richard Burges Library, 9300 Diana in the NorthPark Mall Parking lot. Each meeting is at 12:30pm on the second Saturday of each month.

Meetings feature demos of the latest ST products, as well as help for those that might have a computer problem. Voting membership in the ST Club is $20 per year, and includes a years subscription to this magazine. Newsletter only memberships are $18 per year. Members also recieve special access to the STE-EP BBS at 915-821-9220. To become a member of the ST Club of El Paso, just drop us a line to: 10953 Yogi BerraEl Paso, Texas 79934

ST Club executive committee 1990-91: Steven Bruck L.R. (Pete) Rosh Tim Holt

Prez talk... Well, if you went to the Amigo Airsho intead of the club meeting in October, here is what you missed:

We are having a drawing for a Christmas giveaway of a LYNX Handheld game system. Donations of $2 get you a ticket for the drawing. A packet of 15 tickets will only set you back $20! Support the club, and I encourage all of you to try to sell at least one packet of tickets. It is a fund raiser for the club, and you might win a nifty Christmas present. Drawing will be held at the December 8th meeting.

The December meeting will also feature our now famous club auction. If you have some excess stuff that needs to go, try to sell it at the auction. Get as much as you can, and the club gets 10% of your final price. We have had some doosies in the past with these auctions, and I know for a fact that WordPerfect will be on the block, as well as a ton of games. Get some money for the holidays, or get few good deals. It's all for a good cause: us!

October's Stealth Fighter meeting saw the best of PD databases, and we also looked at some of the new? mags from Europe that Jenkin's is now selling. Made me want to cry when I saw all the stuff they have over there that we can only dream of having...

Anyway, buy some tickets, and have a happy turkey day. I will see you at the December meeting, it promises to be a real winner!

STUN

The ST Users Network -- supporting users of the Atari ST, Mega, and newer technology computers. P.O. Box 27285 Salt Lake City, Ut. 84118. STUN operates a 24 hour BBS -- (801)272-4243. Open meetings are held on the 3rd Wednesday of each month at 7 P.M. in the Murray High School.

STUN is happy to be included in AIM for our first issue! Putting a club newsletter together can be a lot of work. It will be great to fit in with such a great publication as Atari Interface Magazine.

Our recent meeting which centered around educational software was fun. It was a special treat to see some of the programs that our own club members have developed. We needed to have some of our kids there to do the demos and show how it's really done. Thanks to all who helped.

Ralph Porter and Brad Davis have shown their STacy laptop computers at our meetings. The accessories that Brad's company has been developing will help STacy owners protect their portables and make them even more portable. STUN takes pride in their members that succeed in adding valuable 3rd party products to the ST line.

Salinas Valley Atari Computer Enthusiasts

SVACE is the only Atari user group in the Monterey Peninsula area. It supports both the 8-bit and ST computers. There is a free disk of the month for all attendants, bring your own disk. Dues are $12 per year and includes Atari Interface Magazine.Meetings are at 7:30 P.M. on the first Tuesday of the month at the Salinas Community Center. Demonstrations and raffles are a regular part of our meetings. SVACE can be contacted at 672 E. Romie Lane, Salinas, CA 93901. Anybody interested in Atari computers is welcome.

President Gary Klugman (408) 758-4894Vice-President Dale Meisenheimer (408) 449-7750Secretary/Treasurer Charles White (408) 449-8986BitStream BBS (408) 449-2150

Our last meeting was late in starting, and we didn't get reminder cards out. Although attendance wasn't great, we had a great demonstration. By combining hardware from different users, we were able to scan things and print them on a deskjet. We all learned things about desktop publishing.

The next meeting (which may have happened already) will be putting two ST's together with a null modem cable. We should be able to demo telecommunications programs and games that users can play over a modem.

Like always we are dependent on volunteers to bring things in to demonstrate and help out. All of us have expertise in different areas, and can share them with the other members.

SWAG
Southwest Washington Atari Group

The Southwest Washington Atari Group was formally created in April, 1985; prior to that, local Atari enthusiasts met on an irregular basis. The group has been holding its meetings at 6:30 p.m. on the last Sunday of the month (save July) at Clark County Fire District #5, Station 3 on 213 NE 120th, Vancouver, WA. SWAG started out with a large following of 8bit owners and as more and more members upgraded to the Atari ST, the membership has become mainly ST owners, but 8bit is still supported. Annual dues are $12 and SWAG can be contacted at PO Box 1515, Vancouver, WA 98668.

S.W.A.G. Meeting Minutes September 23, 1990

First order of business was discussion of letters mailed to vendors promoting the combined area club's November '91 Atari fair. Search for an building continues. The building must have enough space, and it must be in Oregon for tax reasons.

The A.I.M. editor explained the format and submission requirements for those wanting to write articles for the magazine. A local deadline (the 5th of each month) has been set to allow time for local editing. We then raffled the Practical Solutions Monitor Master. The monitor Master was substituted for the Cordless Mouse which had died and was being replaced. John Moore was the winner.

Steve Traxler then demonstrated his STE with a new stereo and enhanced color demo program. He also showed us some of his commercial software that doesn't work properly on the STE. He doesn't know if the problem is with the hardware, or if the software authors took shortcuts (ala the 800 to XL problems).

Mike Calvin mentioned the problems he has been having with his older 520 since he converted to 1 MEG. It seems the MMU chip is dying. Another has been ordered, and he will let us know if the problem is fixed.

TACE

Tinker ACE of Oklahoma meets the first Saturday of each month at 1 PM (12:30 set-up time) in the Moore Public Library, 225 S. Howard, just off of SW 4th and I-35 in Moore. TACE can be contacted at 104 E. Northrup, Midwest City, OK 73110 or at the TACE BBS (405) 755-9561, 24 hrs., 3/12/2400 baud, running Oasis 4.3 software with over 60megs online storage. ST & 8bit support. Dues: Full - $20, Correspondence - $15. Dues are prorated at $1.25/month for correspondence membership and $1.66/month for full membership.

President/VP	Greg Ray	(405) 964-3765
Sec/Treasurer	Stephen Moffitt	(405) 732-8449
Librarian	Chris Hamilton	
BBS Sysop	Rick Spencer

WAUG!

The Washtenaw Atari Users Group meetings are held every second Tuesday of the month at 7:30 pm in the Michigan Union building on the campus of the University of Michigan on State St. at the corner of S. University in Ann Arbor.

Club dues are $15 per year and provide access to the PD library and subscription to AIM. Meetings feature demos of both 8bit and ST software and hardware. Nonmembers and questions are welcome. Officers can be contacted by calling Craig Harvey at (313) 994-5619 or by BBS at Molin's Den at (313) 451-0524.

The October meeting of WAUG was held on Tuesday, 10/9. Craig called the meeting to order at 7:40pm announcing the feature topic would be a demonstration of the SuperCharger IBM emulator from Talon, courtesy of Bill and Pattie Rayl. Craig gave an update of progress in planning for the Atarifest, noting that we still needed a volunteer to run the club booth during the two day show (as most of the officers already have other duties to perform...)

While waiting for the computer to be set up to start the demonstration, Craig also listed upcoming meeting topics:

Nov - Tim Purves of Michtron will speak. Dec - Christmas Party/Games Jan - MiGraph hand scanner Feb - Printers (we'll attempt to show printouts of .IMG pics created with the scanner...)

Craig presented an idea to change election night from June to another month, suggesting December as having the largest member turnout. April was also considered, but due to lack of interest/concern on the part of the attending membership the topic was tabled for further consideration by the officers.

Bill Rayl gave a great demo of the SuperCharger, noting its compatibility with all models of STs AND the new TT. Mike Olin followed Bill's demonstration with the "Atari" IBM program that reads from/writes to 8-bit Atari diskettes in a standard IBM drive. This program is in the Public Domain and has been used by many ex 8-bit owners who have moved into the world of MS-DOS (gag me with a CLI!)

Craig announced the raffle of the last copy of PageStream, and last-minute investors were given a final chance to buy tickets. The drawing was then held, and Russ Crum was the lucky winner. Congrats Russ!

Bill gave a description of the files on the latest AIM disk, after which Craig adjourned the meeting.

UNYACE
Upper NY Atari Computer Enthusiasts

The Upstate New York Atari Computer Enthusiasts (U.N.Y.A.C.E.) meet monthly at the New York State Electric and Gas building, on Old Vestal Road in Vestal, New York. Meetings are from 7 to 9 PM in the Auditorium. The next meeting date is March 12th.

U.N.Y.A.C.E. had optional dues of $8 per year. Monthly meetings are informal and open to all who are interested in Atari microcomputers.

Contact C. Todd Krissel, President, at (607) 729-4303 or call the Cygnus BBS at (607) 729-5506 (9600 baud, 24 hrs/day) for more information.

RAM

Ventura-RAM, a charter member of ACE-NET, meets the third Wednesday of the month at the Mercury Savings Bank at 1656 Arneill Rd, Camarillo at 7:30p.m. in the Mercury Room. Membership dues are $24 for a full year, pro-rated monthly. Renewals are only $20 a year. Newsletter membership only is $15 a year, pro-rated. For more information on Ventura-RAM, contact PO Box 1513, Camarillo, CA 93011.

President/Newsletter Ed.	Tim McCoy
Secretary	Toni Peters
Treasurer	Mike Portanova

WACO
WESTMORELAND ATARI COMPUTER ORGANIZATION

Westmoreland Atari Computer Organization meets the second Tuesday of each month in the North Huntingdon Township Town House, Center Highway and Brownstown Road (just off Route 30 near the Hamilton car dealerships, Irwin, PA) at 7:30 P.M.

Founded in December, 1983, WACO boasts huge ST and 8bit PD libraries. Double-sided disks are only $3 for members, $4 for non-members. Disk catalogs on disk are only $2. The $20 annual membership ($24 for family) now includes a subscription to AIM. as well as the vocal, consumer-oriented WACO Printout newsletter which features Z*NET. Memberships by mail are welcome.

WNY AUG

WNYAUG meets at 7:30 pm on the first Thursday of each month in room 116E, Bacon Hall at the State University College of Buffalo Campus, 1300 Elmwood Ave.

Dues are $15 for new members and $12 for renewing members. Send checks and correspondance to WNYAUG, PO Box 59, Buffalo, NY 14216.

Dealer, Distributor, & User Group Inquiries Welcome!

PageStream®

WHEN YOU WANT THE VERY BEST!

PageStream is the most sophisticated and unique DTP system for the Atari ST. Its diverse menu options and capabilities allow the user, whether professional or amateur, to fully utilize the imagination when designing brochures, newsletters, advertisements, product information sheets, résumés and MUCH MORE!

☛ FONT VERSATILITY! From unique to serious, PageStream's diverse font library enables you to truly set your document apart from the ordinary. Choose from a variety of typefaces, point sizes and text attributes!

☛ SUPPORTS MOST PRINTERS! PageStream supports dot matrix, inkjet and non-PostScript lasers. But did you know that PageStream outputs to PostScript printers? With a PostScript printer or a software based interpreter such as UltraScript, PageStream can generate enhanced output with tremendous definition, page layout accuracy and gain access to high quality imagesetters utilizing this industry standard!

☛ IMPORT GRAPHICS AND TEXT FROM VIRTUALLY ANY SOURCE! Import graphics and text from other popular programs developed for the Atari ST, Commodore Amiga, Apple Macintosh and IBM PC. Incorporate previously designed clip art, logos, and illustrations to enhance your documents!

☛ FULL-COLOR CAPABILITIES! Output to numerous color printers, from dot matrix to PostScript. PageStream also supports four-color and spot-color separations. Add color to intensify your creative image!

☛ ROTATE, SLANT AND/OR TWIST OBJECTS! Maneuver objects to desired angles. Be inventive with charts and headlines. Let Your Imagination Be Your Guide!

Soft-Logik combines versatility, ease of use and customer support to bring the Atari ST user the very best in DTP software!

"PHASE-3"™

PRISM-PAINT

PRISM-PAINT 1.0 is a powerful drawing program that runs in all ATARI resolutions plus 1024X768 4096 color mode and 24 bit true color with 16 million on-screen colors and is fully TT-32 bit tested and 68030 compatible. Not only will you find many of the features expected in a drawing program (such as boxes, circles, ellipses, area fills, cut, copy and paste, (with fine pixel editing), but also explores some rather unique areas of it's own! One of the more interesting areas of **PRISM-PAINT** is that it uses **PRISM-TABLET** (Graphics Tablet Environment) which supports the new Cal-Comp graphics tablet in four resolutions. Another feature of **PRISM-PAINT** is that it uses all of the computer's memory to support multiple picture buffers. This can range from approximately eight buffers on a 520ST to over 110 buffers on the MEGA4 ST, which allows the creation of animations using the built-in slide-show features.

When used in combination with other PHASE-4™ programs **PRISM-PAINT** takes full advantage of ADEPT* and the Image Systems ISAC High-Res color board.

PRISM-TABLET

(Graphics Tablet Environment)

PRISM-TABLET is a fully functional graphics tablet environment designed to be used with all "PHASE-4"™ programs. This feature is embedded in all programs and available as a stand-alone program which can be used with most well-behaved ATARI programs.

For more information write or call Lexicor Software Corp.,
58 Redwood Rd., Fairfax, CA 94930, (415) 453-0271.
Dealer inquiries welcome.

AIM is produced on a 4 Meg Atari STe, HP Laserjet II with PacificPage Postscript cartridge, PageStream and Calamus.

From The Reader's Viewpoint

Dear Bill & Pattie—

Hi to all of you! AIM is an outstanding magazine. It's a pleasure to enjoy the products of people who do a good job. My thanks to each of you.

Enclosed is a letter to Tim Craft of CACE. Please forward it to him.

Dear Tim, Enjoyed reading your article 8bit Q&A in the October issue of AIM. I have a problem. My Atari computers are 1200XL and 130XE.

Many printed (or listed) 8bit programs have a READ statement. The ensuing DATA statements contain a series of numbers, eg 243, 22, 199, etc. What are those numbers? Where does a programmer get those numbers? How do I learn to use such numbers in my BASIC programs?

Some articles and manuals list PEEK locations followed by strange words such as VDSLST, VINTER,SIOV, etc. (See page 31, October issue of AIM.) What do those words mean?

Atari Friendly,
Joseph Hicswa (JACG)

AIM:

I don't know where else to turn. The Atari 800 still remains a breakthrough as far as I'm concerned. It is the *only* computer I know of that has *four* joystick ports useable by durable, inexpensive joysticks. This is important because I and the neighborhood gang can't get enough of four-player games.Competitive or cooperative, arcade or strategy, we love them to death! We starve for more!

Please, tell me how/where I can get more four-player games. Any multi-player games will do also. These games are tough to find. Not to mention Atari 8bit software as a whole. Please include cost and ordering info also. Thanks!

Larry Nocella
Woodbury Heights, NJ

[Eds: Can anyone who reads this help Larry out with multi-player games, either PD or commercial?]

Right On Target

David Plotkin

The first raindrops of autumn are just starting to fall on a *very* parched Northern California as I write this in mid-November, 1990.

It is certainly welcome—another dry year and we'd have had a new round of water rationing. The rain is going to make moving difficult, though. Yes, I sold my house and bought a bigger one with a mortgage to match.

The pressure from my spouse for more room finally wore me down. And though you may have heard that the real estate market in California had gone flat, such things are relative. True, real estate here is not escalating at the insane rate of past years—but this affects buyer as well as seller, and selling a house (like anything else) is just a matter of pricing it right. Mine sold to multiple offers in six days—I guess I priced it right.

Misfortunes of Moving

The job I am going to like least about moving is moving my Mega ST. The tangle of wires behind my nice, neat workdesk is beyond belief.

In fact, the new buyer, inspecting the house, questioned if I had not had to modify the house circuitry to handle such an incredible load. I had not, of course, since everything plugged into the outlet is a low power device.

With everything on at once, the lights don't even dim—which I can't say about the times my wife fires up her iron.

The wires aren't all electrical—as I have detailed before, my system is chock full of switches for external drives, printers, monitors, even RS-232 switches. I have a modem, and a Video Key, and a Mouse Master...well, you get the picture.

Untangling the Tangles

I've been scratching my head for some time over two things. The first is how to even untangle the mass of wires. They seem to have multiplied over time, like some nest of incestuous snakes, and their number seems to increase every time I look back there.

It ain't pretty, folks. The second problem will be hooking everything back up correctly. I'm not sure I can remember how everything goes together any more. I puzzle over this every time I modify my system.

The answer, it occurs to me, is to label each cable and wire with the name/description of its termination point. As I pull each wire off, I'm going to put a piece of tape on the end and use indelible ink to write where it plugs in. This ought to work, and actually presents an opportunity to neaten things up behind my desk. I'll let you know how it works out.

The tangle of wiring is an unfortunate necessity with the Atari ST. My PC, which is equipped with nearly all the same equipment as the ST, has very few wires.

The reason is that most of the equipment on a PC (drives, controllers, switches, tape backup, modem, etc.) can be mounted internally in the case and wired directly into the bus. I happen to have a big case on my PC—a full-size tower that still has empty slots and drive bays. It's really too bad the ST can't be packaged in a larger case that can carry many of the peripherals internally. I have heard rumblings of such things from Europe, but have yet to see anything appear here. So, I guess, for the meanwhile, we live with it.

AIMing High

I got my latest issue of AIM today, as well as Current Notes. Once again, I have been struck by just how fine these periodicals are.

The real thing that stands out is that they are definitely labors of love. This is not to say that they aren't professional—they are. And though both magazines are run as businesses, there is an underlying something that says "we like what we do." I find this extremely refreshing.

I read a lot of computer periodicals, from very dry publications like Computerworld and PC Magazine to some small local mags like Computer Currents and Microtimes. These last two are indigenous to Northern California, although I hear versions are springing up around the country.

Many of the periodicals are simply put out to turn a profit (unfortunately, I begin to feel STart is falling into this category). But the ones that are put out because the editors and contributors really *want* to put them out shine.

Bill and Pattie Rayl of AIM and Joe and Joyce Waters of Current Notes are not getting rich doing this—Joe/Joyce and Bill/Pattie don't even earn their "real" livings producing their respective publications. Nevertheless, the world would be poorer without them.

I look forward to receiving

these magazines every month, as they let me know what is going on in the world of Atari in a personable, yet professional, manner.

Making Mac ROMs

Have you ever wondered where all the Mac ROMs were coming from? I mean, the ones that you buy to pop into a Spectre cartridge. After all, Apple doesn't exactly produce lots of extra ROMs. And it isn't like a dealer needs to stock ROMs as spare parts—ROMs don't go bad and never have to be replaced.

In fact, the only source I know of for "spare" Mac ROMs is upgrade kits for Macs. That is, people who have older Macs that use the original 64K Mac ROMs can upgrade at an authorized service center.

Among other things, the 64K ROMs are replaced with the newer 128K ROMs. That, by the way, is why 64K ROMs have always been relatively plentiful—they are left over from Mac upgrades.

A little simple arithmetic, though, will show that something is amiss. I don't know how many Spectre and Spectre GCRs Gadgets by Small has sold, but it's a lot. I would guess the number is now nearing 10,000. Now, there aren't many un-upgraded Macs in the world any more, so Apple doesn't produce many upgrade kits. Those they *do* make, they keep pretty careful track of. So where the heck do all the Mac ROMs come from?

As it turns out, a very inventive fellow in the Midwest has been making bogus Apple ROMs. That is, he was actually burning ROMs copied from Apple, and even silkscreening the Apple logo right onto the ROM, so it looks like the real thing. These were then sold to unsuspecting dealers (at least, I assume they were unaware they were involved with fraud), who sold them to eager Atarians.

As you can probably imagine, the guy made a fortune. His cost to manufacture the ROMs was probably on the order of a few dollars, and he was getting close to $100 each for them.

When he was caught (yes, crime does not pay!) he was in possession of a half million in cash and a weapons arsenal (guess he was expecting trouble!). He is in jail now.

As Dave Small has commented many times, it doesn't pay to mess with Apple's lawyers (unless you're Microsoft or Hewlett Packard, who are successfully fending off Apple's latest legal maneuvering). But for the little guy, it's not a good idea. The question in my mind now, though, is where are we going to get Mac ROMs for future purchasers of Spectre?

See you next month!

COMDEX FALL 1990

Michael Drysdale

As an Atari dealer and reseller, I probably look at COMDEX a bit differently than the press or a user. Here, only somewhat organized, are my views of this major computer show.

Off the Bat...!

The first stop in the Atari booth was Spectre 3.0x on a TT connected to a MEGA with an 030SST (Gadgets' much talked about 68030 upgrade for the ST) via AppleTalk as demoed by Doug Wheeler of Gadgets.

Bob Brodie cruised by and I latched onto him for a tour of the exhibit. Next stop was PageStream 1.8x on a TT. Fast? Yes. But even better was the display—TT hi-res 640x480 in 16 colors.

They were sending output in Postscript format to a QMS color printer. Full color DTP to slobber over. Next to that was Migraph, showing TouchUp's new ability to load/save grey scale TIFF and PCX files and thus print true grey scale from PageStream.

On a surprise visit to the Atari booth was Beach Boys' Bruce Johnson and James Grunke, keyboardist who uses C-Lab's Notator for everything but live performances. Story was they provided passes to Atari for their Las Vegas show.

I spent lots of time with Jeff Williams, GEnie SysOp. He showed me how to use Alladin on GEnie and gave me a copy of same. Listen up people, it is time to stop using CompuServe.

Augie Ligourie stopped me and asked how I liked the Portfolio which I was using to make these notes. Well, that was his mistake!

I promptly pounced on him for a discussion of Stacy marketing and configuration. My only impression was of Teflon; he's heard all the dealer feedback before and it just doesn't stick.

Don Thomas of Atari talked about new application cards for the Portfolio. Look for Spellchecker, Thesaurus, Language Translator, City Guide Book, Expense Tracker and more.

What hardware did Atari have at their exhibit? Some products we can talk about, and some we can't.

The New Mega STe

First what we can't tell you about. The MEGAe (a Mega STe). Yes, Atari showed lots of them.

When can you *buy* one? Not any time soon (wait at least three to six months). When (*if*) it arrives, it will offer all the features of an STe plus: Math co-processor socket, VME bus (which is more standard than the MEGA bus, which it won't have) and a 16Mhz 68000.

Remember, the units at COMDEX *weren't* final products. Therefore, anything you read about them could be changed by the time they actually go on sale in mid '91.

Everywhere in the display (and on dealer price lists) was the TT. List price is $2999 for 2mb RAM and 50mb hard drive. The PTC-1426 color monitor runs $549. I'll not repeat here what you must have read months ago about it.

Not shown and not available (or in the foreseeable future) for US distribution was the CD-ROM drive. The few Stacys there appeared to be owned by developers. Atari said little about it.

Portfolio

There were lots of Portfolios. Shown was its ability to connect to Mac, ST and IBM machines. Nifty stuff was a portable 20MB hard drive and an A-D converter. This was clearly the product Atari is pushing. Watch for over $1 million of advertising for it this holiday season.

What products were on display: Pagestream, Calamus, Dynacadd, Spectre, LDW Power, WordFlair, Tracker, Hotwire, GEnie, ATspeed, and Talon Technologies' IBM emulators.

Noticeably missing were WordPerfect, games, color drawing/animation programs and anything for video production. Unlike many other booths, there were no knock-your-eyes-out sight and sound demos.

"Will there be any advertising for the TT or STe?," I asked of a very high-ranking executive. *"No,"* was the answer. He suggested it was up to dealers.

Little known fact: 30 percent of Atari's business is in educational markets. An Atari executive hinted there may be a promotion aimed in that direction.

Here are some tidbits for you hardware dwe...uh...specialists. Does the TT have a Genlock port or will the VME bus do? Do the TT and MEGAe have a clock? They act like they do, but no mention in the specs.

The MEGAe keyboard is neither an ST or MEGA keyboard; it's something else.

An offhand comment from an Atari employee (possibly a techie) revealed the TT has a 1.44MB drive but the drive controller chip only formats to 720K. However, the chip is socketed. So get out your chip pullers and....

Does the MEGAe have an internal DMA or SCSI port? Or is that TT case misleading? Why doesn't Atari sell a version of the TT without the math coprocessor and hard drive and less RAM? A lower price might encourage more people to upgrade. Of course it might take sales from the MEGAe which won't be here till...

Did you know the TT will accept 26 meg of RAM! The MEGAe will(?) have TT TOS, so why not the STe? There's no Blitter in the TT. Hopefully someone will explain why a 68030 doesn't need it. Is the MEGAe so similar to the TT that one could fit it with a 68030 or is the case again misleading?

What you may read about what Atari said at the show about various products will vary depending upon: 1) who said it, 2) who they thought knew what or 3) what they thought they were authorized to say and to who. In other words, if you get conflicting information about COMDEX, don't be surprised.

Other Sights

I could not help but notice a kiosk prominently displaying all of Atari's products in front of the main entrance to the Las Vegas Convention Center.

Video Toaster—if you have not heard about this product on the Amiga (and soon MS-DOS), listen up. Go and seek out info on it; go see it. It will change the way you think about computers and video.

The POQUET palmtop was available from distributor Ingram Micro-D. To be a dealer, you must order 25 units or $40,000 minimum order. With dealer demands like that and a $2000 price tag, Portfolio should continue to outsell it 14 to one.

Why do Intel, IBM, Apple, Compaq, HP ($3 million to be a dealer), etc. bother to exhibit? They have all the dealers they want. Must be the prestige of having more money than you can spend.

There was a long line of people waiting for an autographed copy of a net-working book. How dweeby.

I watched a Mac II play back segments of Star Wars and Roger Rabbit better than regular video.

For those of you who think a trip to a convention in Vegas is exciting, I must make reality clearer. This is a working trip. As sole proprietor of a store, being in two places at once (East Detroit and Vegas) is difficult. If I'm in Vegas, the store must close. So, to minimize this inconvenience, I travel at night.

This is my second time to Las Vegas and COMDEX. Vegas is beginning to seem much like a plain, middle-aged hooker. The makeup and sequined dress looks glamourous and promises decadence; but underneath, things are wrinkled and sagging.

A Second Look at COMDEX

Irwin Brooks (LACE)

The Atari booth was the largest or near the largest on the Sands convention center floor. It was located adjacent to the entrance doors and was highly visible to all passers by.

Atari TT

The Atari TT030/8 runs TOS (and Unix?) at 16MHz [Ed: The TT CPU runs at 32MHz, while the rest of the system clocks in at 16MHz]. As of 11/14/90, the TT was in its 3rd week of FCC testing for Class B (home use) certification.

The TT was planned to be available and shipping by COMDEX time. However, initial first design tests of the TT showed that its electronic emissions were over the allowable FCC limit. This resulted in the case being redesigned to eliminate the RF shield and use brass-coated covers instead.

Mega STe

The new Mega is much more than just a repackaged Mega in a TT case. The Mega STe is now a 16MHz, Blitter-equipped Mega with all the other advantages of the STe. The Mega STe now sports stereo sound, 4096 colors and the TT's desktop. Plus, the Mega STe can be equipped with an optional 68881/2 floating point math coprocessor for even more speed.

If that's not enough, how about Genlock for your multimedia video processing? This is quite the needed upgrade for the top-of-the-line ST computer series. Enough of an enhancement to get me thinking another ST could be put to some good uses.

Stacy

The Stacy laptop failed FCC Class B approval. So now, the word is the Stacy will no longer be offered for sale in the US. Atari is allowed to sell Stacy only to music distributors that sell to music retailers. And, who do you think would buy a music computer they can't sell to musicians, since Stacy can not be made available to any end users?

The Stacy product outlook is anybody's guess.

Portfolio

Yawn...the Portfolios at COMDEX seemed to draw some attention, but it was not a hit. Contrary to some beliefs, Atari does not have a corner on the palmtop market. In fact, there were palmtop computers at about every other booth, most with more features than the Portfolio. I wish Atari luck in this, since they could use the capital for more important things.

Software

Hot Wire—Charles Johnson and John Eidsvoog of CodeHead Software were there all three days answering questions and helping educate others on the benefits of this powerful desk utility.

NeoDesk 3—It's as good as the reviews have said, but unless you've seen it you can't imagine the difference. NeoDesk 3 is the desktop Atari should model all future revisions of TOS after!

HyperLink—The Atari Mega/ST's lookalike to Apple's HyperCard. HyperLink is a shell application standard program. It, in itself, can be developed into an indispensable desk tool but "stacks" must be written to work under HyperLink.

Graphics, database and spreadsheet data are easily handled by HyperLink. Look for this to be the shot in the arm the ST market needs to gain notoriety and respect.

WordFlair—Wordflair 2 is expected to be available at the end of November. Wordflair 2 is a new kind of software on the ST computer. It's not a word processor nor a desktop publishing program but a document processor.

A document processor was explained to me to be a word processor with selectable fonts, graphics import capabilities like a DTP but also it has a spelling checker and the speed of a word processor. *[EDs: See the Sept. 1990 issue of AIM for a review of Wordflair.]*

SoftLogik—PageStream 1.82 was on display running on an Mega STe. Softlogik has informed me the TT version is available free for TT users. (For version 1.83, registered PageStream 1.82 owner need to contact SoftLogik.) PageStream version 2 is in the process of being ported over to the Atari ST. It is already available for the Commodore Amiga. Expect PageStream 2 to be available in late first quarter of 1991.

Hardware

Gadgets by Small, Inc.—Gadgets had the GCR running on the TT. The AppleTalk networking was being demoed between the TT and a Wallaby (portable Macintosh). The speed on the TT was impressive. The TT with the GCR compares to a Mac SE!

DreamPark Development—Our local guys (from Salt Lake City, UT) were there promoting the Power Drive (1.44bM floppy modification), a LapMate 720K floppy disk drive (allows the same drive to be used on the Atari STs and a PC laptop) and a yet un-named DMA to SCSI convertor to allow Macintosh peripherals to be directly plugged into your ST.

That is about all that comes to mind from the Las Vegas COMDEX held from November 12 to 17. I hope I didn't miss anything or anybody. If I did, I apologize. This was one of the most impressive displays of Atari unity and cooperation I have ever seen. Let's hope this is a sign of renewed life for Atari.

Hard Disk Systems to
Fit Every Budget

- All systems are complete and ready to use, included at *no extra cost* are clock/calendar and cooling blower(s)
- All ABCO Hard Disk Systems Are Fully Expandable (you are *not* limited to two drives only!) All cables and connectors installed
- SCSI Embedded Controller Mechanisms!
- ICD Advantage+ Host Adapters!
- OMTI High Speed Controllers

51mb #SGN4951	519.00
65mb #SGN6177	619.00

A new level of integration…

- ☐ Fast word processing.
- ☐ Spell checker, thesaurus and hyphenation.
- ☐ Quick and easy page layout.
- ☐ Fully integrated financial calculator.
- ☐ Creates tables and graphs. Simple drawing tools.
- ☐ Imports graphics: .IMG, GEM, DEGAS, NEO, MacPaint, Spectrum, Tiny, Doodle and Art Director.
- ☐ Sophisticated mail merge. Imports comma and tab delimited ASCII data.
- ☐ $149.95 suggested retail price. Registered Wordflair users may upgrade for $25 through December 15, 1990.

The Right Brain

Living with a Multiple Personality Defect in Your Machine

Paul D. Stampfli (El Paso)

As I write this in mid-November, I see that is happening in the pages of AIM.

Billy Bob Ray stunned a few folks with his outspoken, albeit anonymous, editorial, and many of our contributors took offense. Some even took the time to think.

I am not going to comment much on this issue, except to say David Plotkin was, once again, "Right on Target," and Steven Leser made some excellent points with his comments on software pricing.

Software piracy is going to be around for a long time, and I think Billy Bob makes an excellent point with the advancement of demos of programs. I know I certainly hate to be stung by a very bad program. (Can you say Turbo Outrun boys and girls?) Shareware is the best way to go, in my opinion, and I want to throw my two cents in to remind everyone to register their shareware and support these hard-working programers.

Of course, I don't want to appear to condone piracy. I don't condone auto-theft, either.

Ok, off the soapbox. I had an interesting conversation with a lady at work just the other day. I gave her a copy of a lesson plan of a professional class I had presented a couple of months previously.

She was very impressed with it, and commented that the Macintosh sure made "things look pretty, but it just isn't compatible with the standard Zenith's that the Army uses." Of course, being who I am, I just couldn't pass up the opportunity to talk about the STIBMAC. So I casually said something to the effect of, "Yes, I printed it on the Mac laser, but I typed it up on the Zenith and got some of the graphics from the Atari bulletin boards here in town."

She was *quite* interested, and we chatted for about 15 minutes about the STIBMAC, and all its capabilities and how "intracompatible" its products can be.

She finally, of course, got around to asking what the basic platform was. When I told her it was an Atari, well, I had to go get my coat. The temperature dropped a good twenty degrees in the room. She stiffened up, and with something of a superior air, excused me from her presence saying she had "important work" to do. She did, however, keep the copy of my lesson plan to use as a reference.

NOTE: For those of you who don't know it, STIBMAC is the term used to identify the ST-IBM-Mac multiple personality computer. That is, an ST with two emulators running. This name was coined, to the best of my knowledge, by Jim Jenkins of Jenkins' Computer, and is about the best label I've heard of for this beastie.

A year ago, I would have been furious over this incident, but today I just shrugged it off and got back to business.

You see, I have found that the world is ready for a machine with multiple personalities, it's just not ready for that machine to have "Atari" on the label. Because Atari means game machine, Atari means 8-bit, 2MHz technology. And, even though you can prove otherwise, the mindset is "it's not compatible, and don't try to confuse me with facts!"

So, I just smile a lot and continue to turn out whatever is needed, in whichever operating system (or personality) is most appropriate, and I wait for the world to catch up with me.

I know there are others doing the same thing that I am, and possibly some more thinking about giving their machines multiple personalities. I say to these people, "GO FOR IT!!!"

You won't regret it for a minute. Oh yes, you'll have to put out some bucks, and some brain sweat, and maybe spend a few late nights trying to fix some things. But, in the end, it will be well worth all your effort and cash.

Suggestions

Before you start this project, get as well acquainted with your products and support as possible without parting with the green stuff. You will need a hard drive; I recommend something in the 60 megabyte range as a minimum.

If you don't have an Atari dealer in the area that you *trust* to get inside the guts of your machine, is there a hardware hacker in your club or area that is very good with a soldering iron? Will your dealer take things back that don't work? Will he stand behind his products? Is mail order better (be careful!)? What is the least expensive route for you that will meet your needs?

Hard questions, the last being the hardest because you don't really know what your needs are until you actually start using the different OS (operation system) and find out what you *can* do with it.

Upgrade your RAM. I have a

Mega 2 and it's getting too small. While DOS isn't too much of a problem, the Mac is super RAM and disk intensive. That's another good reason to go with a hard drive (faster is better, down to about 21 msec. Faster than that is pretty much wasted), as Mac mode will give you tennis elbow swapping disks.

Get a monochrome monitor if you are going to use the Spectre. Although it will work in color, it's not very good, and the graphics and screen quality are stunning in mono. I recommend a monochrome anyway, if you do anything other than play games.

IBM Emulation

I have PC Ditto II for the IBM personality. I got Ditto I early on, and ordered the upgrade *months* before it was ever up and running. PC Speed isn't as flexible, and Supercharger, as far as I know, doesn't support sound, and is much more expensive. Of course you get the extra RAM with Supercharger, and it looks nice, and you don't have to solder it to the 68000 CPU. I haven't got a handle on the 286 they are supposed to be releasing, but if you're reading this (Talon Technologies), I would be very happy to beta test or review a unit for you! *Hint Hint.*

The large board size with PC ditto II means that you will most likely have to put Ditto II outside the case. Of course, you can remount your ST in an IBM style case. This is a pain, but not as much of a technical problem as you may suspect, and gives you a great place to put your very own (personally designed) STIBMAC logo, as well as all the drives and cables you'll ever need. It also clears up your desktop, especially if you go with a tower case.

When running in IBM mode, use at least DOS 3.3, and make a backup of your system disk. Then, you can experiment all you want with autoexec.bat, config.sys and all those other fun things IBM forces on you. Then, even if you screw up in a big way, you can always start over again with your back-up.

Keep your IBM stuff in a separate partition of your hard disk and let it be. While it's much more convenient, and *usually* safe, to move IBM files with the mouse from the GEM desktop, MSDOS doesn't always like the results! The best thing is to leave that IBM partition alone except for data files you are moving to another OS. By the way, always save a backup copy of data files in the original OS, as they can easily get trashed in conversion.

Specifics

There are some things you just don't want to do, trust me! Let me warn you about the ones I know about. MSDOS is a command line nightmare, but it allows you to write, from that command line, your own batch files as well as configuring your system and telling the computer how to boot up. It even allows you

Retail store and order lines are open from 10:00am to 9:00pm EST. Please call our customer service line @ (703)949-8799 for any defective returns. We honor all manufacturer warranties. Our staff is dedicated in providing our customers with the best pricing and service possible. Write to us at : Blue Ridge Computer Systems 510-F W. Broad Street, Waynesboro, VA 22980.

to define your own prompt from the command line. MS-DOS can be very trying, but it can also give you a very deep feeling of satisfaction to master it.

Use the autoexec.bat file to tell the computer which programs to run at boot-up, and in what order. Also, specify if you do/do not want to reset you date/time on the computer.

If you'd like to see more, without an IBM emulator, you might consider .ACCess! from Rock Digital. This Command Line Interpreter works from GEM and gives access to many of the strengths of an IBM while still keeping your ST a one-personality deity.

Spectre

Which brings us to the Spectre and Dave Small. This guy is a pure, unadulterated genius and has my utmost respect. He started out with Data Pacific and the Magic Sac. Gee, what a hippie, Dave! A computer board in a brown paper bag that was stapled shut! Ah yes, the old days!

Anyway, you can choose the Spectre 128 or the Spectre GCR. I recommend the GCR because it will run Mac disks right out of the box. You will need to buy the cartridge and the Apple ROMs. These can be had for less than $400 total if you shop hard.

Don't overlook the Mac personality just because you have a mouse and a desktop. A Mac is *not* an Atari. I overlooked this OS for too long a time before I woke up and got on the ball. It's a great OS, with a lot of very fine applications written for it. And, while it's true that the Spectre emulation is a Mac Plus (a computer no longer supported by Apple), the Plus was the PC of the Apple world for a number of years, and most applications will run in the Plus environment.

Specifics

The Mac has some *super* software written for it. Support from Gadgets is the best in the business, on a par with WordPerfect. When you consider the size differential of the two companies, what higher praise is their? Most all Mac software will run on the Mac Plus emulation of Spectre. The emulator set-up software allows you to make the Mac partitions of the hard drive invisible to the other operating modes. This is a good thing, as otherwise wholesale HD destruction would occur.

Moving data files from ST to Mac is accomplished through the Transverter software provided, but you have to get your own System. System is the Mac software OS and can usually be procured cheaply, (or free) from the same place you got the ROMs for the cartridge. I strongly recommend that, if you have the space, make a small (one meg or so) Mac partition as MFS. Trust me. MFS is an "old style" Mac format, but is what is supported by Transverter, and doing this will save you a ton of time in transferring files.

What about word processing? Well, there's MS Word, Works, MacWrite, WordPerfect and on and on and on. And *all* of these allow the direct importation of graphics into the document, even in the most basic versions. And fonts, *wow*! There are more fonts than you can shake a stick at.

The only limitations are your memory and your imagination. Take it slow. I've had some *very* frustrating times in the world of emulation. Do not kill your machine, or throw it out the window. Just turn it off and come back to it later.

And something to dream on is this: When Atari delayed and delayed the TT, Small has started producing the 68030 board for the ST. While not a TT, it is reportedly very fast! When Atari says, "we'll have so and so by this and this date," and fails over and over again to deliver, Dave Small says "We can't do that, it's impossible, the stuff is all incompatible." And generally within the year, it is sitting on your desk.

I just got the Spectre newsletter, and I was heartened by reading Dave's comment in response to the question "Will we have a Mac II emulator on the TT?" Says Dave; "No. The 256K ROMs aren't available, NuBus would have to be completely changed, the monitor memory map is incompatible, and so on and so forth."

Hard Driven Bargains!

TOAD Drives

PowerDrive

Paul Gittins (PAC)

When I saw the new ad by DreamPark Development of Salt Lake City, Utah for their PowerDrive, my first thought was that what they were saying couldn't be done.

The Floppy Disk Controller (FDC) chip in the ST simply is not capable of doing formats of the density required for 1.44 megabytes of disk storage. You know how things always seem to be too good to be true.

Naturally my curiosity was peaked and so a few minutes later I was on the phone talking with Howard Abrams about their new product. He agreed with me that a normal ST FDC is not capable of high density and that is the heart of their new package.

What they have done is remove the original FDC chip and replace it with a newer style chip capable of the desired operation. I must hasten to add that you cannot simply unplug the old chip and replace it with a newer one.

First off, the FDC is soldered into place and has about forty pins to deal with. Second, there are some control lines dealing with the higher density and drive selection which need to be considered.

The PowerDrive takes care of these problems, as it comes on a small circuit board about two inches square with the new FDC chip and a couple of associated components. The board design is very neat and the quality is quite good.

To install the PowerDrive controller, the original FDC chip must be removed and a socket is provided which is installed in its place. A small socket adapter board is provided which plugs into the chip socket and provides a couple of jumper selections as well as a cable plug-in assembly. A ribbon cable is plugged onto the adapter board and run to the PowerDrive board.

Installation

The installation of the PowerDrive circuit will take a competent technician from one to two hours depending on the condition of the computer and where the board is installed.

I was quite pleased with the overall installation. On the newer 520s and the 1040s, there is a very nice spot for the circuit board between the disk drive and the power supply, almost like it was left there for this purpose.

Did I forget to mention the high density disk drive? You will also need to obtain a high density drive. This can be obtained from DreamPark or you can "roll your own."

I recommend getting the entire package from DreamPark. The HD drive can either be installed internally as drive A or externally as drive B. Using the drive internally will require some artwork (carving) on the case of your ST as the eject button will probably not match the case of your computer.

When using an external HD drive, there needs to be a way to let the computer know which type of disk is being used, normal or high density. This is done by running a control line from the disk drive to the computer.

There is a small square hole in the opposite corner from the write protect notch which is used to identify a high density type disk. The drive senses the high density disk and then provides a signal to the computer via the control line.

This line must be wired from the drive to the FDC where it is recognized by the PowerDrive circuitry. Unfortunately, this means a small hole will need to be made in the case or your computer to accommodate this wire.

Extras

The software provided with the PowerDrive is both attractive and functional. Not only does it format at 1.44 megabytes, but will actually extend the format up to 1.7 megs. It works and it works well.

The PowerDrive has the ability to switch between step rates, which means you can use also use 5-1/4" drives. Also, the data transfer rate is faster, which means programs load quicker and disk write functions are faster. The speed increase is on the order of 25 percent.

If you should decide to "roll your own," I strongly suggest using a TEAC drive. Not only is the quality very high, but this particular drive has functioned very well under all tests.

When I installed the PowerDrive, I used another type of drive and found I needed to do a little work on the drive to find the Density Select line. Had I used the TEAC, all the work would have been done for me.

The price at the time of this writing is $259.95 for the PowerDrive board and External HD Drive, $189.95 for the board and internal HD drive and $119.95 for the board only.

Support

I had occasion to talk with the people of DreamPark and I must report their philosophy of doing business is very refreshing. They are totally committed to quality and top-notch customer service. They went to a lot of trouble to write a clear and usable manual, and as a result, my installation experience was very good.

If you have the need for higher density or just the desire to reduce the size of your archives and backups, then this could be your solution. Once it is in place, it is transparent until you actually require its use, then it works. Using it is simple and trouble-free and I recommend it highly.

I must add one final caution. I have repaired a few ST computers in my time and very often I have seen hack jobs performed by incompetent would-be technicians. Do not attempt this installation unless you have anti-static soldering and desoldering equipment. You must also use good craftsmanship if you want this to work. It is not hard to do permanent damage to the ST, especially while removing chips. Many times, when STs need repair they are sent back to Atari for board exchange. If there is visual evidence of hacking, Atari may not accept the board and you are then the proud owner of an unrepairable ex-ST.

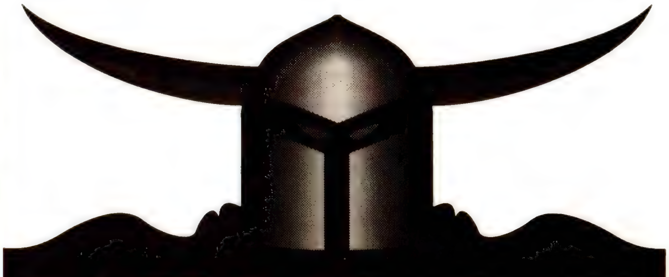
HIGH DENSITY DRIVES for the ATARI ST

POWERDRIVE™

Put 1.44 Megabyte Storage in your ST!

The PowerDrive modification board allows you to use standard high density drives that automatically down-grade to standard ST format. Comes with formatting software to format up to 1.7 megs.

Board and External HD Drive... $259.95
Board and Internal HD Drive... 189.95
Modification Board only... 119.95



CARTOGRAPHER

The Editor for Chaos Strkes Back™ and Dungeon Master™ Saved Games

With our easy to use, mouse-based program, you can display the maps contained in your saved games, and then alter them at will. Remove walls, pits and any other obstacles that you need removed. You can even remove the locks on doors. Only **$19.95**

Hewlett Packard DeskJet 500

The Inexpensive Laser Alternative

Micheal A. Calvin (SWAG)

Looking for a good quality graphics printer, we had narrowed the field to a Panasonic 1124 dot matrix or the Hewlett Packard DeskJet. We were impressed by both printer's output.

The Deskjet had only one drawback, the ink was not waterproof. Cost was another consideration, as the Deskjet was about three times the cost of the Panasonic.

On my way to work one day, I heard an ad on the radio for the "New DeskJet 500 with waterproof ink." So far, so good! Then they said the price was $509! Whoopee!.

Three days later, we went to Portland with Allan Coker to a Hewlett Packard dealer he knew of. The dealer said: "Yes, we have the new 500's, but don't have one unpacked for display." I asked if they had any literature on the 500 and was told they did. We looked over the literature and asked the price. "$485 out the door" was the answer. "Sold" said we and paid for it.

We've had the 500 for four weeks now, and are very impressed. The 500 has three resident fonts—Courier, Letter Gothic and Times Roman. It also sports a 16K internal buffer and slots for additional memory, font and emulation cartridges. It feeds sheet paper or envelopes.

The print resolution is 300x300 and compares favorably with laser output. Print speed with the resident fonts is 240 cps draft and 120 cps Letter Quality, or about three pages a minute in draft.

Most of our software supports the 500 (sometimes as a LaserJet!). We have only had three programs that don't support it, and they are all GDOS programs.

Word Perfect installed with no problems using the Deskjet *plus* drivers for each of the fonts. MVG has a Deskjet setting. Pagestream 1.8 has a Deskjet driver.

The 500 will also operate as an ASCII printer, allowing you to print *Readme* files and *Doc* files from the desktop. If one really wanted to get total compatibility, there is an optional Epson FX emulation cartridge available ($70-$80).

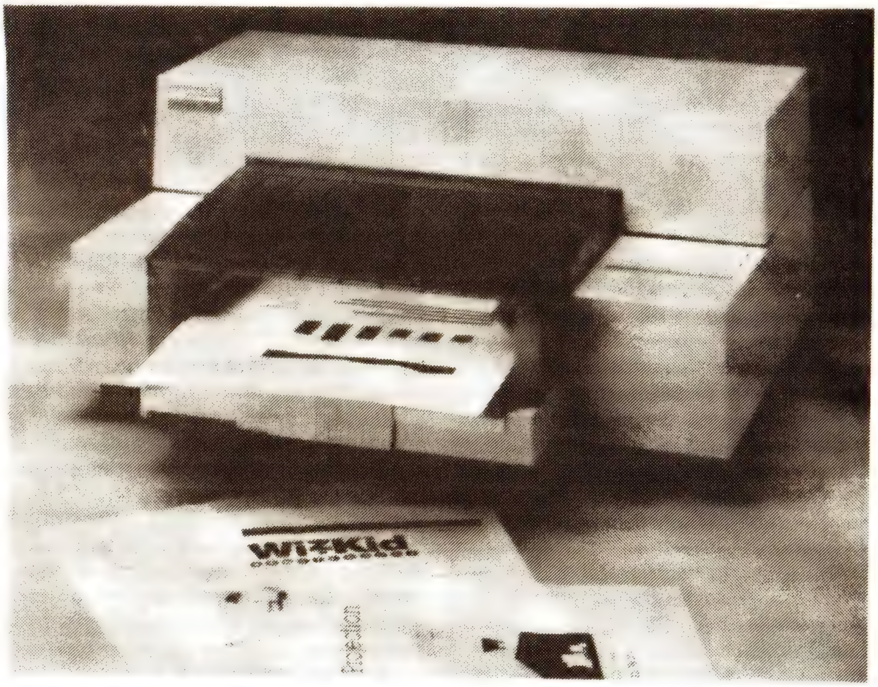
We are using the Deskjet 500 for almost all of our printing. It is faster and quieter than the Panasonic 1091. The only thing the Panasonic does now is print labels, as labels are quite speedy. The Deskjet will use all labels and paper that are made for the laser printer.

Ink cartridges will last for around 300-400 pages with mixed text and graphics. If used in draft, and printing text only, you should get about 600 pages from a single cartridge.

Replacement cartridges (and this replaces the head at the same time) have a suggested list price of $19.95, although you can find discounters and mail-order firms selling them for much less. This calculates out to about 5 cents a page for good quality graphics, and about 2 cents for text of laser quality.

Summary

For less than half the cost of a laser printer, you can get the quality of a laser. There is a sacrifice in speed, but the cost more than offsets that. The ink is really as waterproof as any ribbon ink; it will weep a little if the page is soaked.



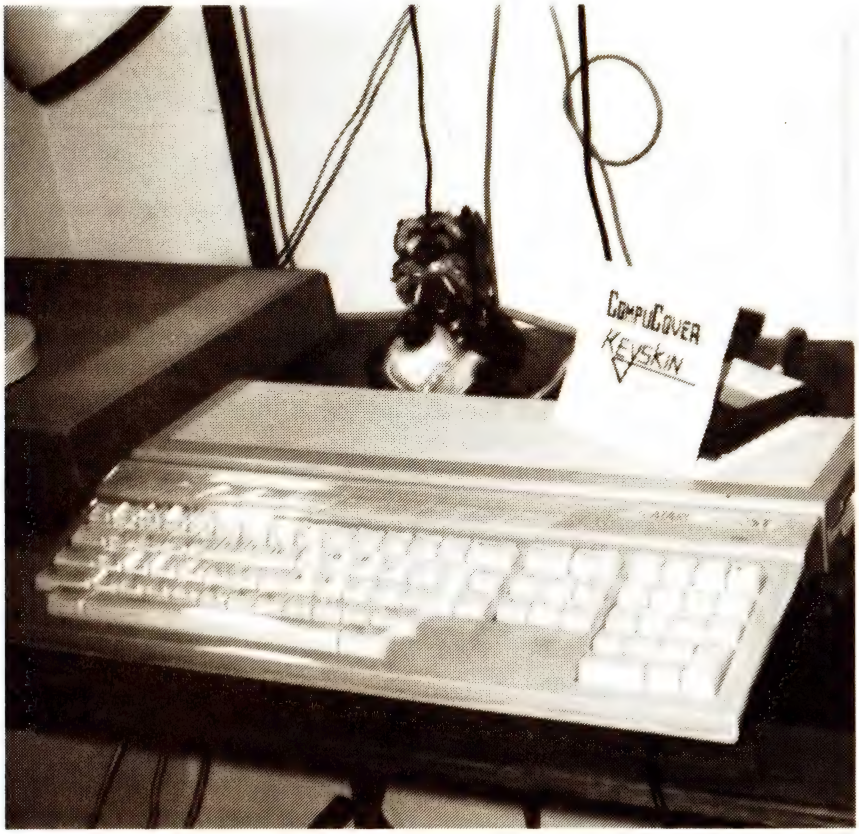
Keyskins—Protection for your ST

Patricia Snyder-Rayl

Looking for "safe typing" on your ST? Computer Supply House in Alaska has the perfect solution for you—Keyskins. These little plastic covers for the ST keyboard fit over your keyboard, including keypad and function keys.

Getting Started

Installation is a breeze, requiring only the plastic cover and your ST. The Keyskin comes with strips of clear, double-stick tape already attached to the cover at strategic points. For us, the hardest part was thoroughly cleaning our STe before putting the Keyskin on!



Slight Modifications

Since there was a bit of a gap in placement of the double-stick tape, we put some extra tape on to try to minimize any "bubble" effect.

We also put a couple extra pieces of tape on the cover at the "home row" keys, so now it's easy to find the home row when typing.

I talked to Computer Supply House about the possibility of putting some sort of bump on the F and J keys, so you would know without looking when you're on the home row keys. Richard Sitbon (owner of Computer Supply House) agreed this would be a good addition, if his manufacturer can offer it to him.

Key Responsiveness

The feel of typing on the keyboard was altered somewhat by the plastic cover, but the Keyskin is made of very flexible plastic, so I was able to get back up to speed once I adjusted to the different feel.

People have complained about the "mushiness" of the ST keyboard, and this will make it a bit "mushier" than before, but definately useable. Protecting your ST or Mega system from spills and such more than makes up for loss of crispness in the key response.

Inexpensive Insurance

At the recent November Chicago show in Gurnee, IL, the Keyskin on our STe received a lot of comments! Not the least of which was:

"My friend sure could have used that a few weeks ago. A can of pop fell off a shelf and landed upside down and emptied into his keyboard. The repairs cost him $300."

The Keyskin retails for $25, but Computer Supply House is offering it for a limited time at only $19.95. This is definately one of the best "insurance policies" you can get your computer!

Mega Click™

For the Atari Mega 2 and Mega 4* Computers

BEST ELECTRONICS

New Product Announcement

Have you ever felt that something is missing from your Mega* computer? Those who have used other brand computers for work or school agree something is missing! When asked, any touch typist who owns a Mega computer will tell you right away! It's the Click in the keyboard key they miss!

Best Electronics is happy to announce their new product for the Mega 2 and Mega 4 keyboards called "Mega Click." By the name you can tell what this product does. After searching the world for half a year, we've found a replacement keyboard switch that gives the Mega owner that positive tactile "click" response like most real-world keyboards!

Our test sampling of Mega owners, who have tried our test Mega keyboards with Mega Click installed, all say the same thing, "I want the product now!"

The installation of Mega Click keyboard switches requires the ability to unsolder and solder-in components in your Mega keyboard. We strongly recommend that installation be done by an Atari computer service center!

Mega Click keyboard switches are packaged in a **30 Switch Starter Kit** and a **10 Switch Add-on Kit**. Suggested retail for the 30 Kit is **$64.95**, and for the 10 Kit is **$21.95**.

Mega Click Products became available December 26th. Place your order now!

THE BEST TRACKBALL

Gary Klugman (SVACE)

I envision a computer interface will sometime come along that requires little, if any, physical movement—perhaps just a slight movement of the finger, or just eye movement.

Imagine a Star Trek interface like just speaking in the room and the computer answers. Better yet, how about controlling the computer with your thoughts? Some day, not that far away, I believe we will have these things.

Until then, I will just have to settle for the best hardware computer interface and the most user-friendly software.

Right now I use a mouse, GEM, various shell programs, powerful utility software and the best productivity software I can find for the ST. At least I did, until I recently started using an "upside down mouse."

Brad Koda from Best Electronics called me and asked if I would like to try a pre-production model of the Best Trackball.

A trackball is essentially an upside down mouse—instead of moving the mouse, you move the ball. The Best Trackball was to be introduced at this year's COMDEX. As of this writing, COMDEX just opened.

Brad said the model I received is exactly the same as the one that will be produced, except the cable will be a different color and the lettering will be different.

It plugs into the mouse port of your ST just like your mouse. The color is battleship gray and beige, so it matches your ST. It is 6-1/8" by 4-1/8". I found it compatible with all utility, productivity and game software I tried.

There's no reason why it would not be compatible; it is essentially just another mouse.

It is ergonomically very well designed. I liked using Atari's Mouse Accelerator 3 with it, since I prefer to move the ball as little as possible. With the mouse accelerator there was no need to spin the ball.

You can move the cursor anywhere on the screen without having to lift your thumb off the ball. A ridge on the right button separates the left and right buttons. This makes it easy to find them without looking at the trackball.

Your hand rests on the flat area of the trackball and your wrist rests on your desk. There is no need to lift your wrist unless you need your right hand for the keyboard.

There is no need to look up at the trackball to find the proper hand position. You can feel it. The buttons are easy to use, with a definite click. Double clicking is easy.

As you might imagine, I really liked the Best Trackball. Moving the cursor and clicking on icons without moving my elbow and wrist was almost like controlling the computer with my thoughts.

There might be some games where the user would prefer a mouse, but other games would feel better with the trackball.

Of course, I had to take it apart.

That was easily done by removing four Phillips screws. The trackball is built like a tank. The internal parts are easily replaced and the ball is easily cleaned. Since Best Electronics specializes in replacement parts, you can be sure replacement parts, if needed, will be readily available from them.

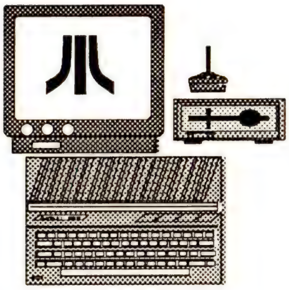
In any review, I feel obligated to say something negative. After all, how many perfect things are there? What comes to mind is the Best Mouse costs a bit of money; the suggested retail is $54.95.

If you have a lack of space, you need this trackball. If you are a gadget person, you will want it. If you are perfectly happy with your mouse, find an opportunity to try out someone's Best Trackball.

It should be available by the time you read this from your favorite dealer or Best Electronics.

SIO2PC

PUTTING THAT IBM TO WORK FOR YOUR ATARI 8-BIT



Bob Woolley (SLCC)

Regardless of any human qualities we may attribute to our machines, a computer is just a device taking data from a source, manipulating it, and sending it to a destination.

I prefer an Atari 8-bit because the real differences in computers are the sources and destinations available to the user and how easily they can be programmed. My Atari has lots and lots of nice input/output—sound, graphics, joysticks, paddles, etc. Where the Atari falls down is in its data storage hardware.

An IBM, on the other hand, is geared to large, fast data transfers. For those who have both systems, using the IBM as a disk subsystem could work wonders! Which is exactly why Nick Kennedy hacked together the SIO2PC hardware and software.

His hardware circuit connects the SIO bus from any 8-bit Atari to the RS-232 interface of any PC. His PC software then emulates an Atari disk drive or printer, allowing Atari files to be stored or printed on the IBM. In addition, Atari files can be converted to IBM format and vice versa!

The complete package of software and construction details is available as shareware ($10), in a kit ($30) or assembled and tested ($50).

Complete (and I mean complete) documentation is included with the product, as well as a willingness to assist users with any stumbling blocks they may come across. This may change in the future as his project gets wider distribution, but Nick has certainly done an outstanding job in the past. (So, let's not burn him out, OK? And, don't forget to send him something for his efforts if you roll your own.)

I got mine from him as soon as I heard about it—only called him once (twice?) during the week it took it to arrive (grin). Normally, the T1000 Toshiba I carry for work stuff pretty much keeps my spare tire company while I'm at home. Now, it has a new purpose in life!

As an indication of how well the SIO2PC is done, I opened the box, plugged it in and cranked it up immediately.

The system is menu driven and has very few functions that don't work exactly the way you would expect them to. The only awkward pieces are those dealing with the PC operations and even those are trivial. So, let's go through the SIO2PC features one at a time.

RAMdisks

The device is basically a RAMdisk that operates on the normal Atari SIO bus. What's a RAMdisk? That's memory (in the IBM) that acts like a disk drive to the Atari.

The hardware portion of SIO2PC is a cable that connects to the SIO on your Atari and the RS-232 interface on your IBM. Running the SIO2PC software on your IBM allows the IBM to "talk" on the SIO bus as if it were an Atari disk drive.

When the Atari reads a sector from an active RAMdisk, the data is really coming from the PC's memory, not a diskette. Although the data is still transferred over the SIO bus at 19,200 baud, there is no disk rotational delay or track seeking time before it can be read.

This produces a continuous stream of data rather than the beep-beep-beep of a normal drive (reading a 707 sector disk from a 1050 takes 85 seconds, from a RAMdisk it takes 55 seconds).

There are four partitions available in the PC—D1: thru D4:—that can be used as RAMdisks on the Atari. These disks can either be created as blanks and formatted from the Atari or loaded from the PC's drives.

There are four sizes available—64K, 92K, 143K and 184K, in either 128- or 256-byte sectors. Once loaded, the RAMdisk displays its size, filename and whether it has been altered since the last save (a very handy feature for those of us who can't keep anything straight).

These RAMdisks are not entirely "safe" until you store them to a PC floppy disk, so keep that in mind while using them. My portable is battery operated, which makes it almost bulletproof. Your PC may not be so lucky!

Any partition that has a "diskette" loaded will become active on the SIO bus as a RAMdrive. Consequently, any physical drives on your Atari system that share an address with an active RAMdrive must be powered off. This is not so easy on the XF551 with its power switch in the back.

One SIO2PC function swaps RAMdrives with each other, allowing you to boot from RAMdrive D1:, swap it to RAMdrive D2: then power up a real drive to use as D1:.

To get yourself going, you will create RAMdrive diskettes, format them, write your favorite DOS and copy Atari files to them. After that, everything will be stored on your IBM drives as PC files, one IBM file per Atari diskette.

My laptop does not have a hard drive, which would hold a *ton* of diskettes, but it does have 720K, 3.5" drives that can store six or seven single density Atari disks. If you're like me, you have multiple copies of some file you were creating scattered over a dozen or more diskettes. Wouldn't it be nice to have time/date stamps on them? With SIO2PC, all my Atari files are managed by the IBM, which has a time/date field on every file! Even Atari disks with no DOS on them will be logged!

I tried a number of utilities and unprotected programs on the RAMdisks and all worked as they should with a few minor exceptions. Protected commercial software will not boot from a RAMdisk, of course, but their data disks will work just fine.

MYDOS 4.5 does not seem to be able to properly calculate the number of sectors on the RAMdisk and formats everything as 1040 sectors. I was able to use VTOCFIX.COM to correct the count, but I got unpredictable results on some attempts. If you see a message about error 138 on sector 257, just try again or swap the address of the RAMdrive. It always works out eventually. Keeping a formatted, blank disk "on file" eliminates the necessity of formatting additional disks, anyway.

BobTerm, AtariWriter (in 2.0D, even!), anything I tried worked fine! The reason for this is there are no patches to any of the Atari hardware or Operating System. No memory is stolen, no drivers loaded, nada. The SIO2PC works right down to the command buffer level of SIO, no kidding.

Printing

The SIO2PC can also intercept the P: device on the SIO. Strange as it seemed, I could print to *both* my DeskJet printer and the PC at the same time (this is not a supported practice, but it doesn't hurt anything). The data sent to the PC can be output to the PC's printer, screen or an IBM-formatted file (printing to the screen does a nice job of previewing your AtariWriter files in 80 columns).

Along the way, you can convert the Atari EOL character to the ASCII CR/LF and/or strip off the high-order bit. This is one way to port an Atari text file to a PC or ST. You just specify the destination on your PC as a file and convert the EOL. Voila! I tried to send an object file this way, but the P: handler sticks a couple of extra spaces here and there which kinda wrecks the file. If a guy were to replace the P: handler with a smarter device handler, it would work great!

File Conversions

Along with printing an Atari file to a PC disk file, the SIO2PC package has an Atari utility (FILE2PC.OBJ) that converts an Atari file directly to an IBM file through the SIO2PC interface. There is a companion PC utility (MAKADISK.COM) that will create an Atari file on one of the RAMdisks from an IBM dataset on disk.

As a test, there just happened to be an Atari utility posted on CompuServe to display Degas picture files from an ST on an 8-bit. In order to use such a program, you normally need to download the ST Degas picture to your 8-bit using a modem or whatever. Since the ST and IBM are compatible disk-wise, I tried sending a picture over from the PC to the 8-bit thru SIO2PC. Worked just fine. Took 15 seconds. No special hardware, no waiting. Just for kicks, I sent it back to the IBM. The file was still intact! In fact, this article will get sent to AIM thru the SIO2PC. Where have you been all our lives, Nick?

Ramblings

Sound like a neat product? How about a remote capability so the Atari can send commands through the SIO to the PC that execute all these console commands? He did that, too! Whatta guy.

Anything not so nice? Well, a couple of little things. Like, the MAKADISK program will create an Atari filename with lowercase characters (if you aren't smart enough to type in caps). When you get it over in your Atari, you can't read it! The FILE2PC program does

The ATARI XL/XE Commercial Software Drought is OVER !!!

S I

SOFTWARE INFINITY proudly presents its Brand NEW *KE-SOFT Series* -- the First Major ATARI XL/XE Commercial GAME Releases to be produced for the North American market since 1987 !! Eleven spellbinding super-sophisticated 1991 GAMES on 9 economically-priced premium quality Disks ! Already Bestsellers in Europe -- newly enhanced to revitalize your XL/XE !

Every GAME in *SI's* *KE-SOFT* line boasts ultra-realistic & colorful state of the art high-resolution animated graphics, outstanding music, and lots of clever surprises. Many also feature digitized speech & sound effects, high-score saves, a password system to skip levels, and a capable Editor to near-effortlessly create your own new screens. Handsome and comprehensively detailed printed Instruction Manuals are written in clear, easily understandable English. All 11 superior 64K *KE-SOFT* titles are endlessly entertaining to novice and experienced ATARI GAMErs alike.

$10.50 GAMES
2 or more for $9.50 each !

ZADOR

Turn over all 144 Chinese-symbol tiles on the game board by matching singles to make pairs that are solely connectible by an invisible line (which can't cross any active tiles or be bent more than twice)! A high-powered Mah-Jong variant with 20 levels and useful "prompt next pair" option.

DRAG

Guide intrepid Drag the Frog past deadly mines, exploding bombs, & falling rocks in a treacherous underground lair, to collect diamonds before his air runs out! 50 screens of Boulderdash-type arcade action.

SOGON

Navigate your sturdy forklift around the 50 barrier-filled floors of a skyscraper to relocate large boxes one at a time to waiting storage bays. Once you've moved a box to any perimeter-wall or partition, you can't pull it back! Devious chess-like strategy; vital backup-one-move function.

ZEBU-LAND

Help Zebu engineer the escape of his 3 brothers from a 50-level labyrinthine world of revolving doors and blocked passageways (move wall-segments aside to reveal exits)!

DREDIS

At last -- the unparalleled mind-boggling Commercial ATARI XL/XE version of the arcade champ Tetris! Ultra-challenging puzzle, multiple levels of difficulty, one- and 2 - player modes.

Order 3 or more *KE-SOFT* GAME titles Mixed ($14.50 & $10.50 items together) -- subtract $1.50 from the price of each !

BACKUP COPY of any GAME Disk is $2.00 if purchased at same time as Original; $ 4.00 if ordered later.
Great *KE-SOFT* GAMES *DEMO DISK* with playable sample screens -- FREE with any 2 GAME Disks, or $4.00 separately.

SHIPPING And HANDLING is always just $3.00, regardless of quantity of *KE-SOFT* products ordered.
NO State Sales Tax is due on any SI Disk.

$14.50 GAMES
2 or more for $12.50 each !

TECHNO NINJA

Voyage to a hostile alien world to reclaim your home planet's ultimate source of power! Encounter 10 perilous landscapes (cities, bodies of water, spaceships, etc.) on 100 screens. Gain energy, earn up to 8 extra weapons, battle over 50 varieties of monsters. Enhanced density disk.

CULTIVATION / CHROMATICS

Two brain-busting puzzlers on one disk!
CULTIVATION: Put away your Farmer's Almanac -- this game's about the strategic "cultivation" of matching symbol-blocks; push together like singles in the proper order to make pairs and clear your choice of100 screens on 10 levels.
CHROMATICS: This mesmerizing 3-level Tetris-style contest utilizes 3 - 5 different colors instead of shapes; rotate the hues of blocks falling into a well to place 3 or more same-colored blocks together at the bottom.

OBLITROID

As the last Star Warrior of Xyros, you must track the evil Tindalos to his underground dungeon and engage in mortal combat! Find special weaponry to survive never-before-seen dangers on 4 Worlds comprising 140 screens; invaluable stop/continue mode. Extensive Manual is packed full of maps & tips. Enhanced density disk.

TOBOT / BROS

Two invigorating arcade adventures for the price of one!
TOBOT: Using his versatile laser gun, our robot superhero must escape a spooky 50-room castle filled with angry spiders!
BROS (Super Mario Brothers - inspired): Traverse 8 Worlds with 4 Underworlds each to rescue your brother from a hidden castle -- collect mushrooms to get power or shots, gather coins to earn additional lives, and vanquish legions of monsters!

SI's Spectacular *ATARI 800/XL/XE/GS Public Domain CATALOG* is only $2.00, or FREE on request with any 2 *KE-SOFT* GAMES. Our large New *ST P-D CATALOG* is $1.00 (stamps okay) everyday. BEST P-D in North America !

not handle a disk full error too gracefully. Nit-picking stuff. Atari should do half as good as this guy.

Who is this Nick Kennedy? He is a young Electrical Engineer from Arkansas who enjoys his Atari and wants to do good things with it. He started out two years ago by interconnecting two Ataris and worked his way up to an Atari and a PC. Much of his earlier experimentation is also included in the SIO2PC documentation if you are interested.

The Atari community is lucky to have such a generous citizen, and for what he is asking, the SIO2PC is a steal. Get that old IBM out of the closet, dust it off and send Nick a check! He can be reached at:

Nick Kennedy, 300 South Vancouver,
Russelville, AR 72801

Power T1000 on. I raise the Toshiba's screen and hit the space bar to abort the powerup memory diagnostics. No Atari disk drives come to life...just the DeskJet, monitor, 1200XL and the PC are on the power strip. The AtariWriter File disk slides into the 3.5" drive on the laptop. I type "A:" - Enter. "SIO2PC 2" - Enter.

The status line announces "Disk Emulator now running." I press "L"oad, "1," "AW2D" - Enter. 184K of data is loaded into RAMdisk 1. Over to the 1200XL, the AtariWriter cartridge goes into its slot. I power up the 1200XL. Continuous SIO data transfer until the AtariWriter menu appears. "L"oad, "AIMJAN" - RETURN. More continuous SIO data. "E"dit. The Happy 1050 is silent, empty. The XF551, XF35 and US Doubler 1050 mimic the Happy. Bending to the task, I begin to type...."<cntl>-C", "SIO2PC"...

Atari ST software for only... $1.00

Each of our SHAREWARE / PD disks are supplied on double sided disks for easy expansion and costs only one dollar each. No gimmicks, no minimum order required, no hassles. Disks added each month!

Our customer offers also include great savings on all Atari ST 3rd party products ranging from games to utilities. Each of our advertised products in our monthly mailings are guaranteed to have the lowest prices. We don't stop our support at just good prices, after being in the ST marketplace for over 3 years now we know what kind of service before and after the sale you require.
In our present mailing you can find out more about our great SHAREWARE / PD disks, the latest commercial software, our game of the month rental plan, and a few more surprises. If you have any questions about our company or would like to be placed on our mailing list please call our customer service line or write to us.

Mac/65: Enhancements and Bug

John McGowan

[Copyright November 1990. This article may be reprinted as long as it is not modified and credit is given to the author and the source.]

MAC/65 is a good assembler for the 8-bit Atari, but it does have one bug of which I am aware and a few more capabilities than are mentioned in the manual.

Bug!

Avoid forward referencing in macros if possible. As an example, try the following code in MAC/65:

```
      .ORG $6000
      .OPT OBJ
      .MACRO IN
      JMP @F
@F    NOP
      .ENDM
      .MACRO OUT
      JMP @F1
      IN
      IN
@F1   NOP
      .ENDM
      OUT
      OUT
      .END
```

Assemble the code with ASM,#- and then type DDT and go to address $6000. You will find:

```
$6000    JMP $600B (correct!)
         JMP $600A (should be
                    $6006!)
$6006    NOP
         JMP $6006 (should be
                    $600A!)
$600A    NOP
$600B    NOP
$600C    JMP $6017 (correct!)
$600F    JMP $6016 (should be
                    $6012!)
$6012    NOP
$6013    JMP $6012 (should be
                    $6016!)
$6016    NOP
$6017    NOP
```

What happened? We should have done a JMP to the next NOP address in the calls to the IN macro from within the OUT macros, and yet we didn't!

However, we did *not* jump to an address from one assembly of the OUT macro to the other but got the wrong address within the proper OUT macro!

The problem is the (incorrect) statement on page 54 of the manual, "another expansion...will reset the labels." Apparently this was true for the expansion of the OUT macros, but *not* for the expansion of the IN macros *within* the OUT macros. In fact, another expansion of an outermost level macro, *only*, will reset the labels!

To do the assembly properly if a macro call is seen, MAC/65 should do a third pass to resolve internal forward references. If another macro is seen within, it should do a fourth pass to resolve the inner macro's internal forward references...etc.

However, as the manual states on pg. 54, the assembler goes to the third pass but doesn't dig any deeper. So, with regard to resolving forward references, MAC/65 *assumes* there are no macros used within other macros!

In particular, in assembling the first OUT macro call, MAC/65 expanded it by calling IN and noting that @F took the value $6006. Then it expaned IN for the second time inside this first call to OUT and reset @F to $600A and *did not tell us* we had a redefined label!

Having gotten the label values, the assembler went back to put in the values. In the first expansion of IN, it used the current value (just derived) of $600A (wrong!). MAC/65 then went along further and noticed the redefinition of @F to $6006 (before the second JMP), reset @F to $6006 and used that value in assembling the code for the second JMP. MAC/65 then continued on and finally reset @F to $600A again, but never used it!

NOTE: MAC/65 *did not* go to the second OUT call until it was finished with the first, since they are different outermost macros!

Now, you may feel this is so strange a bug that it has never come up in your programming, but it has if you use IOMAC.LIB from the manual!

Consider, to jump over a data set, would you use form1 or form2 below?

```
form1
      JMP @F1
@F    .BYTE "My string",0
@F1

form2
      JMP *+3+9+1
@F    .BYTE "My string",0
```

In form2, the 3 is the length of the JMP absolute command, the 9 is the length of "My string" and the 1 is for the 0 byte.

No one in their right mind would assemble as in form2 (having to do hand assembly and count the number of bytes in the string) and yet...we do not have form1 in the @FL macro on page 88:

```
      JMP @F1
@F    .BYTE %$1,0
@F1
```

But the @FL macro *does* use form2:

```
       JMP *+4+%1
@F     .BYTE %$1,0
```

And we have just seen the reason! If form1 was used in the

@FL macro, every expansion uses forward referencing. And so, if form1 were used, the @FL macro could not be used twice with literal strings within one outer macro. Supposing form1 were used, then

```
   OPEN 1,4,0,"D:FRSTFILE"
   OPEN 2,8,0,"D:SCNDFILE"
```

would work (the OPEN macro on page 90 only uses the @FL once, and we have two outer macros to reset @F1). One may write a copy routine using such code and debug it.

Then take the code and insert a .MACRO COPY in front of the code and a .ENDM at the end to create a COPY macro, changing the code to OPEN 1,4,0,%1 and OPEN 2,8,0,%2 (and later I will talk about why this is *not* necessarily %$1 and %$2!).

You can debug this and note that it works! As long as at least one of the parameters in COPY is the address of a filespec. Then a year later, you use COPY "D:START","D:END" and it bombs! For now, *inside* the COPY macro we have two uses of the @F1 label, forward referenced (the label @F1 only shows up in the expansion of @FL if a literal string is used!). Now—a hypothetical year later after writing the COPY macro—try to debug it! This is why form2 is used in the @FL macro.

I had been writing a routine to do FP (floating point) addition using string versions of FP numbers. (Actually I was debugging a set of FP macros and routines downloaded from a BBS...I was working on the code and trying, somehow, to get it to work.) I had a macro to convert a string to FP and put it in FR0 which did a jump to the OS code and included:

```
     BCC @FP
     JMP FPERROR
@FP
```

This was done because the OS routines flag a bad conversion with the carry flag (like if someone tried to convert "this is not a number" into a FP number). I couldn't just use BCS FPERROR as the FPERROR code might have been far away...The macro worked fine.

The routine then moved FR0 to FR1 and loaded another number to FR0 and then did the addition. The routine worked fine.

Then, I put it in a macro called ADD...and it bombed! *Again* it was a use of the loading routine which used forward referencing twice in the ADD macro (NOTE: It is the fact that the LABEL @FP showed up twice, not that the load routine showed up twice...if you have two different macros used in one outer macro and they use the same label, and use forward referencing, you will bomb).

Another example...the BUMP macro on page 58 of the manual will conditionally assemble

```
     BNE SKIPHI
     INC %1+1
SKIPHI
```

if used with one parameter. Now, this is quite a useful macro and you can have a routine which does a BUMP REG1, then later BUMP REG2 and the routine works fine. Then you put the routine in a macro and...bombs away!

Again, a forward reference used twice...works fine in debugged code *until* that code is inserted to be used in a MACRO!

What to Do?

We can take a hint from the @FL macro in the manual. Do not use forward referencing in *any* macro that may be used twice in another macro and give unique label names to labels used by distinct macros. For instance, don't use @F as a label in a PRINT macro and a LOAD macro if 1) it uses forward referencing and 2) these two macros may sometime show up within one outer macro!

The FP load routine above can be corrected by changing the BCC @FP to BCC *+5 (the 5 coming from the two bytes used by the branch, and the three bytes used by the JMP FPERROR).

You can try the same thing in the BUMP macro, replacing the BNE SKIPHI with BNE *+5 (two bytes for the branch and three for the absolute addressed INC). But, what if the INC is *not* absolute addressed, but zero page addressed? Then it should be BNE *+4!

The trick here is to change BNE SKIPHI in the BUMP macro on pg. 58, line 37 to BNE *+4+[%1>254]! This will use absolute addressing when %1>254. That is, %1+1>255 (%1+1 is the address used in the skipped INC) or %1+1 is not a zero page address! Make this change in the BUMP macro and it will work, even if used with one parameter more than once in another macro.

What if you have code with a BCC @LABEL to a forward label and there is a lot of code between...some may be zero or absolute, some conditional assembly, etc.? Then, you cannot easily assemble by hand to find the correct offset used to correct the problem. Use forward referencing in this case, *but* put a comment in the macro code that the macro *must not* be used twice within another macro!

(A short note: AMAC, the AtariMacroAssembler has its own bugs and problems, not the least of which is that it is still in version one on a copy protected DOS2.0 disk and is incompatible with SpartaDOS). But AMAC does *not* use local labels in macros, but instead uses unique global labels. This takes up label space, but AMAC has *no problem* with forward referencing of labels used within macros used within macros).

This *is* a bug in MAC/65. And the code for the @FL macro indicates that some of the programmers at OSS were aware of it, but the BUMP macro code indicates that not all were aware of the problem. It is (as far as I am aware) undocumented until now.

And this bug can be severe, especially when debugged code works, then—when put in a macro—works sometimes and bombs sometimes (as in using a version of @FL in form1 above, where only one reference to a parameter is a string...then it works...but not if two are references to a literal string). MAC/65 will give *no* error message as to the duplicate use of the label! *Beware* of using forward referencing in macros in MAC/65!

%(LABEL)

Now that I have covered the bug, let me describe an enhancement. On page 57, the manual notes %(LABEL) is legal. This trick is used in the XIO macro on page 89:

```
@@IO  = %0
      @FL %$(@@IO)
```

We will see that %(@@IO) works as well in the next part of this article, but here is an undocumented item...%(expression) works as well. Try the following code:

```
      .OPT OBJ
      .ORG $6000
TEMP  .EQU 4
      .MACRO IN
      .BYTE %$(%0+3-4)
      .BYTE %$(1+1*1)
      .BYTE %$(TEMP-4)
      .ENDM
      IN "testone ","testtwo"
      .END
```

Assemble (ASM,#-) and go to DDT at address $6000...use the "W"indow command and note that memory contains "testone testtwotesttwo." In particular, on page 89, we can eliminate the need for the definition of @@IO by changing line 2240 of the code to @FL %$(%0) [or even %(%0) as we will see later].

Parameter Passing

Try the following code:

```
.OPT OBJ
.ORG $6000
.MACRO IN
.IF %1<256
.BYTE %$1
.ELSE
.WORD %1
.ENDM
.MACRO OUT
IN %1
IN %$1
.ENDM
OUT $1234
OUT "test"
.END
```

Now assemble and investigate address $6000 from DDT. There are two calls to IN inside the OUT macro. For the OUT $1234 call, one would expect the IN %1 to work. But, the first four bytes at $6000 are $34,$12,$34,$12...that is *both* versions of the call IN—including IN %$1—give the *same* result!

This is used in the XIO macro on page 89, which uses @FL %$(@@IO). This will work even if the last parameter in the XIO call is the address of a string!

But look at the next set of bytes. The call to IN %$1 in the second call (OUT "test") is expected to work. But, we get "testtest" (use the "W"indow command in DDT to check the ASCII values), so the IN %1 call did just as well!

Thus, we can pass a parameter using %1 or %$1 *ad libitem.* Though, when it is *used* rather than passed, it is necessary to use the correct form...in the sample above, we could not have used .BYTE %1 in IN and expect the proper result!

In particular, in the XIO macro, line 2240 could have been @FL %(@@IO) or @FL %$(%0) or even @FL %(%0).

Thus, one can simplify the OPEN macro on page 90 by replacing the entire set of lines from 2470 to 2500 with either XIO COPN,%1,$2,%3,%$4 or even XIO COPN,%1,%2,%3,%4

Endnotes

In the IOMAC.LIB code in the MAC/65 manual, the programmers did indeed correct for the bug mentioned above. But, in the description of building macros (in particular the BUMP macro on page 58 and the PRINT macro on page 61) the manual is silent on the bug. Apparently it was known and corrected for in the IOMAC.LIB, but the documentation on writing one's own macros is strangely silent on the problem.

The IOMAC.LIB does use one of the enhancements (parameter passing) in the XIO macro on page 89, but, strangely, not in the OPEN macro on the following page! The form @FL %$(@@IO) is used rather than %(@@IO), but the alternate form was known to the programmers at OSS since the equivalent macro (called SGET) on the toolkit disk uses SGET %3 rather than SGET %$3 or the useless code used in the OPEN macro as presented in the manual.

It seems the manual presents enough material to use MAC/65 (though some code may be buggy), but does not take the time to fully explain the bugs corrected in the IOMAC.LIB or the use of the @FL %$(@@IO) in the XIO macro. Nor does it explain the parameters printed in a listing (what does %1763 IN mean when assembling with a macro called IN?).

The description of the use of %$ on page 60 is incomplete [as the possibility of using %(@@IO) rather than %$(@@IO) in the XIO macro and the material on parameter passing, above, shows].

All in all, it is a manual enabling you to use MAC/65, but the deficiencies above are quite notable. I hope the material I've supplied here will enable other MAC/65 programmers to write bug-free code more easily.

Please consider this an addendum to the MAC/65 manual...material that should be known by every MAC/65 programmer.

SUPERCHARGER V1.4

BREAKS THROUGH THE BARRIER

Full MS-DOS Compatability With Real Time Multi-Tasking Plus **EXPANDABILITY**

We will buy your
PC-DITTO II™
OR
PC SPEED™
FOR
$75.00

When you purchase your SuperCharger directly from RIO Computers
Offer good thru Dec. 24, 1990

SUPERCHARGER OPTIONS SOON TO BE RELEASED

SCplus/NET - Full networking board

- Connect DOS and TOS programs or files under Novell™ etc.
- Transfer rates of 2.5 Mbits/sec.
- Plugs into existing expansion connector with no soldering required.

SCplus/286 - Turns SuperCharger into a full 286 co-computer

- Runs at 12 MHz on a pure AT chip set
- Comes with 1 Meg of RAM expandable to 4 Meg - full EMS support
- Contains true AT expasnsion slots - accepts ANY expansion card
- Provision for an 80286 co-processor
- Plugs into existing V30 socket with no soldering required.

SCplus/386 - Turns SuperCharger into a full 386 co-computer

- Runs at 16 MHz on a pure 386 chip set
- Comes with 1 Meg of RAM expandable to 4 Meg - full EMS support
- Contains true expasnsion slots - accepts ANY expansion card
- Provision for an 80386 co-processor
- Plugs into existing V30 socket with no soldering required.

NO INTERNAL
MODIFICATIONS
REQUIRED

PLUGS DIRECTLY INTO THE
DMA PORT OF YOUR
COMPUTER

MS-DOS INCLUDED

- RUNS CGA AND HERCULES
- EQUIPPED WITH 1 MEG RAM
- USES EXISTING MOUSE AS DOS MOUSE
- SUPPORTS 5.25" OR 3.5" AS SECOND DRIVE
- PRINTS TO THE ATARI LASER FROM DOS
- SUPPORTS ALL HARD DISKS WITH AHDI DRIVER
- SUPPORTS ALL PARALLEL PRINTERS
- USES ST SERIAL PORT UP TO 9600 BAUD
- ATARI 3.5" DISK READS/WRITES AS 720K DOS
- SOCKET FOR 8087-2 CO-PROCESSOR
- USES SUPERCHARGER'S RAM AS 1 MEG RAM DISK
- USES ST'S RAM AS RAM DISK IN DOS
- RUNS 286 AND 3.0 WINDOWS
- BUILT IN BUS FOR FUTURE EXPANSION
- SEPERATE 5V DC SUPPLY
- INSTALLATION MANUAL
- 12 MONTH WARRANTY
- SHIELDED ABS CASE (FCC CLASS A CERT.)
- ONLY 6.25 X 7.25 X 2.25 IN.

TRUE MULTI -TASKING

Connect several superchargers together to run different programs concurrently

HOT KEY

Allows TOS/DOS switching without rebooting.

TOOLBOX

Programming interface to allow programmers to develop their own background tasks.

LAUNCHER

Execute DOS programs directly from your TOS window.

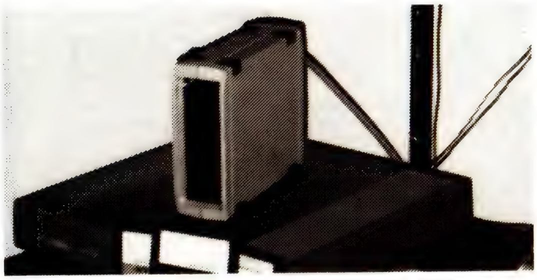
SuperCharger - Only

$450

V1.4 Upgrade Kit - $19.95

SuperCharger

IBM Emulation Made Easy



Bill Rayl

Sometimes, it's tough being an ST owner in an IBM world. IBMers have access to thousands of very specialized software the likes of which we may never see on an ST. At least, not in "native" mode. That's the reason STers have been so intrigued by IBM emulation almost since the beginning.

The first attempt at IBM emulation, MS-EM from Paradox, was just that—an attempt. MS-EM almost, but never quite, worked right. Then came Avant Guarde and pc ditto and STers had a solidly working, albeit slow, IBM emulator.

Now, the ST market is nearly flooded with hardware-oriented IBM emulators that give full-speed (or better) emulation and excellent compatibility. Nearly all of these involve some kind of modification to your machine. It might be as simple (relatively speaking) as soldering to the 68000 or as nerve-wracking as cutting up your ST case!

SuperCharger, from Talon Technology (and RIO/Datel...more on this later), is currently the only available IBM emulator that does not force you to open your ST to install it. Just plug it into the DMA port on your ST (or on your hard drive) and away you go!

What You Get

SuperCharger is like a miniature IBM in a box that plugs into your ST. Inside the SuperCharger case is a well designed board containing an NEC V30, expansion bus, one meg of memory (socketed) and a socket for an 8087 math coprocessor.

There are a couple options for powering the SuperCharger. First, the hardware originally came with a cable that plugs into the ST's joystick port and allows SuperCharger to draw power directly from the ST.

However, there was a notice in the package from Talon that they did not recommend this setup with modified STs or a one meg SuperCharger. Since all SuperChargers are now, to my knowledge, being shipped as one meg units, this power method may not be too useful. It is a nice option for Stacy owners, though!

I got SuperCharger with an external power supply. It means yet another thing to be plugged into the power strip, but it's the only practical choice with my 2.5 meg ST.

The manual that comes with the package is pretty sparse, to say the least. It tells you how to set up the system and gives a diagram of the board in the SuperCharger case. No software compatibility charts are presented and very little info on how to set up your CONFIG.SYS or AUTOEXEC.BAT files is given (the installation software on the supplied disks does this for you). The manual is almost more a set of reference notes than a user's guide.

SuperCharger comes with three disks, two of which are the System and Utilities disks containing MS-DOS 4.01. Not PC-DOS or any other substitutes, but real MS-DOS. You don't get any of the MS-DOS manuals with the package, unfortunately.

If you're unfamiliar with the MS-DOS world, don't expect the SuperCharger package to teach you anything about using DOS.

On one of these disks is a nice program called DOSSHELL. This little IBM program lets you do file manipulation and lots more using cursor keys or even the mouse. It ain't GEM, but it's pretty nice.

Of course, you can always run DRI's GEM/3 under SuperCharger...or even MicroSoft Windows 3.0! Both are commercial packages you can buy from any IBM dealer.

The third disk you get has all the ST utilities for SuperCharger. These include ABIO.TOS and ABIO.ACC, which actually initiate the IBM emulation. These are currently at version 1.4, with version 1.5 recently announced as "coming soon." You can also set a program allowing you to use the SuperCharger's memory as a RAMdisk in the ST.

One of the nice features of emulation under SuperCharger is that you can switch from ST to IBM mode (and vice versa under ABIO 1.4) without resetting either the ST or SuperCharger. Consequently, you can be running programs *concurrently* on both platforms with no problems!

Compatibility

I'm happy to say SuperCharger has run every piece of IBM software I've thrown at it. That includes packages like CrossTalk, Procomm Plus, Norton's Utilities, Ventura Publisher, Lotus 1-2-3. Word Perfect 5.1, Right Writer and numerous PD and shareware programs. Some of these I brought home from work just for testing purposes.

Although SuperCharger does

seem to run most IBM software, there are some pitfalls. For instance, when I first tried running Procomm Plus under SuperCharger, it would lock up every time.

A call to Talon revealed I needed to run Procomm's setup program and redefine COM2 to have the same HEX value as COM1. After doing this, Procomm booted up with no problems. I had, in the past, used Procomm Plus under pc ditto without needing to do this. Proof that all is not equal under IBM emulation.

There have been a number of reports from users having some problems with the desk accessory version of ABIO. The system would randomly lock up from time to time. Switching to ABIO.TOS clears up the problem. The problem has been acknowledged by Beta Systems (the programmers over in Germany) and will reportedly be fixed in version 1.5.

Speed

Speed is such a relative thing, so I'll try to approach it in relative terms. First, ads for SuperCharger claim to have a Norton SI rating of 4.4. In relative terms, a standard IBM XT has a rating of 1.0 and my IBM AT at work has a 5.9 rating. That means, according to the Norton SI rating, SuperCharger runs nearly as fast as an AT. Pretty good.

On a program-by-program basis, though, there seems to be a bit of a difference in speed. Programs like Lotus 1-2-3 and Ventura seem to run as fast as they do on my AT. Some software—mainly graphic-oriented—seems to be a bit jerky. Procomm doesn't seem quite as snappy under SuperCharger as it does even on the XTs at work.

In comparison to the software-only pc ditto, SuperCharger is blindingly fast. It's like the tortoise and the hare, only the hare doesn't waste any time in crossing the finish line! Switching back to pc ditto, as I did when testing my problems with Procomm Plus, was almost a painful experience.

Sound and Graphics

The two weakest points concerning SuperCharger's emulation are in the area of sound and graphics. As for sound, there isn't any. The IBM has never been known for high quality sound effects, but not having system beeps or any sound whatsoever is a bit disconcerting, at least to me. The Beta Systems engineers have reportedly gotten sound to work, but it slowed the emulator down. There is current discussion of making a plug-in speaker card. However it's done, adding sound is on the list for future upgrades, but it's not available now.

As for graphics, SuperCharger supports standard CGA or Hercules monochrome graphics. In CGA mode, you only get four colors instead of the 16 you'd get on a real IBM. I've never been a big fan of CGA graphics to begin with, and I have Super VGA (1024x768x256 colors) on the IBM at work. With only four colors, many IBM games are going to be disappointing on this emulator.

The Hercules monochrome is quite usable and very similar to the ST's own monochrome mode. The Hercules resolution is 720x350, while the ST's is 640x400. In order to give you "true" Hercules monochrome, SuperCharger centers the monochrome IBM output on your monitor. You can then press a key to shift from side to side to see the pixels that don't fit on the screen.

Upcoming Products?

According to announcements from Talon Technology, work is being done on a VGA card that will plug into the expansion bus inside the SuperCharger. Hey, this really is just like a miniature IBM! No definite release date or price has been announced, though the VGA card has been discussed since April 1990.

Talon has also announced that an 80286 upgrade would be available in early 1991. The upgrade would come as a daughter board that replaces the NEC V30 on the SuperCharger motherboard. The upgrade would "probably" have a socket for an 80287 math coprocessor, since the 8087 coprocessor will not work on a 286 machine.

Already available is a software package called TC!Power. This program allows users to "build Expanded Memory from Extended Memory, hard disk space or both." The program will work with any IBM emulator on the ST. Under SuperCharger, you get the added option of using the ST's internal memory as Expanded Memory on the IBM. Some programs, like Ventura Publisher, can take advantage of this extra memory.

Talon or RIO/Datel?

When SuperCharger first hit the US market, Talon Technology was the only company selling and supporting it. Since then, RIO/Datel has begun SuperCharger support as well. RIO/Datel is a branch of a German company that sells SuperCharger in Europe. A number of magazines have also been running SuperCharger ads from *both* Talon and RIO/Datel lately. This has caused some confusion in the market as to what is really going on and who to buy from.

At this time, both RIO/Datel and Talon continue to sell SuperCharger. According to RIO/Datel employees, they are currently the only US distributor of SuperCharger and everyone (including Talon) now buys the emulator from them.

Recently, Talon has obtained exclusive rights to import PC-Speed and AT-Speed to the US and Canada. These products, which compete directly with SuperCharger, were originally marketed in the US and Canada by Michtron, which has been sold. Whereever you purchase SuperCharger, the planned upgrades (being done by Beta Systems in Germany) should occur.

If you're looking for sturdy IBM emulation with an emphasis on productivity, SuperCharger is the best available. If the VGA and sound card and 286 upgrade become available, this package will be hard to beat.

ATARI 8-BIT

SOFTWARE - PARTS AND BOOKS FOR ATARI XL / XE & 800/400 COMPUTERS

1050 MECHANISM

Factory fresh TANDON mechs. make difficult repairs a snap. Units are complete with Head, Stepper, Spindle motor, belt etc. Just plug in, no difficult alignments or adjustments required.

$47.50

POWER PACKS

Exact replacement transformer for 800/400, 1050 810, 1200XL, 850, and XF551 units. Part #CO17945.

$14.50

XL/XE SUPPLY

Power Pak for 800XL,600XL 130XE, 65XE & XE Game.

$25.00

KEYBOARDS

New and complete subassembly.
Easy internal replacement.

130XE/65XE	$35.00
800	$40.00
800XL	$29.50
400	$12.50

XL 40 PIN LSI CHIP SET

A Complete set of 40 Pin Large Scale Integrated Circuits for your 800XL, 600XL or 1200XL computer.

Great for quick repairs! Set contains one each of the following: CPU, GTIA, ANTIC, PIA AND POKEY.

$16.95

800 4 PIECE BOARD SET

Includes Main Board, Power Supply Assembly, CPU Module and 10K Revision B Operating System Module. All boards are new, tested and complete with all components. $28.50

800/400 MODULES

NEW PARTS COMPLETE WITH IC'S

• CX853 16K RAM Module	$9.50
• 800/400 CPU with GTIA .	$8.75
• 800 10K "B" OS MODULE	$8.75
• 800 POWER BOARD	$14.50
• 400 POWER BOARD	$9.50

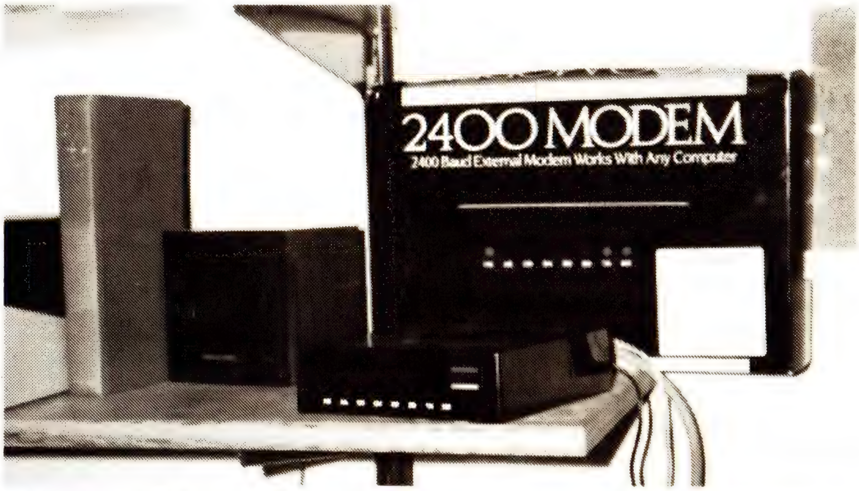
JoppaFAX
The Smart Person's FAX



Patricia Snyder-Rayl

It was a dark and stormy night. The detective moistened his nub of a pencil once again to take notes. "Just the FAX, ma'am. Just the FAX?"

"Yes, detective. This FAX is just too good to be for real."

"Well, ma'am, Joppa has served the Atari Community very well for the past four or five years. I know Mark at Joppa, and he's a very upright kinda feller. Their new FAX-modem is an excellent value, not a cheap come-on."

"But how can he do it? This is such an excellent FAX and 2400 baud modem, not to mention how good the software is too. And he's only asking $169 for it!"

Shaking his head in wonder, the detective says, "It's one of those mysteries of the modern computing world."

Not Just a FAX

The Joppa FAX is a FAX machine and modem all in one. To use it as a FAX machine, you need Joppa's software and your ST computer.

The Joppa FAX will work right out of the box as a 2400 baud modem, and their software runs it as a 4800 baud FAX, with an optional upgrade available to take it to 9600 baud. This upgrade costs extra and requires replacing chips inside the modem itself. Joppa will do the upgrade at your request.

The Joppa FAX plugs right into the ST's serial port (the same as any other modem) and works fine with your favorite terminal package. I use Flash! with it all the time. It does everything any other modem can do.

However, the Joppa FAX can't do everything any other FAX can—it cannot receive FAXes. But, it sends FAXes with ease. You can even create your FAX letters in PageStream, Calamus or just use ASCII text or even IMG or Degas pictures. This is where the Joppa FAX software really shines!

In the software for the FAX are some conversion options to convert pictures or text to "JFAX" format. This is what the software looks for when sending files through the FAX-modem. Included in the package from Joppa are two printer drivers—one for PageStream and one for Calamus. Since all documents I FAX are in PageStream format, I use that particular Joppa driver.

Installing the driver for PageStream is as simple as installing the drive and choosing the Print to Disk File option. Once the driver is installed and you're finished creating the document, just select Print Document and enter a filename. PageStream then goes on its merry way, printing your document to disk in JFAX file format.

Once this is done, just load Joppa's FAX software and you can either view this new document or send it to an awaiting FAX machine.

Once the FAX is sent, don't be alarmed by the message from the software saying it can't print out a little slip acknowledging the receipt of your FAX. Since the Joppa FAX can't receive, and the other FAX is trying to send, it's perfectly natural and doesn't affect the FAX you sent in any way.

A Few Options

Your FAX can be modified in a few ways, according to your preferences. If you'd like your document to be centered, more to the left or right, or even at the top, middle or bottom of the page, you can set that under the preferences options.

You can also set the resolution between fine and normal and whether the scaling on your graphics is normal, double or automatically adjusted. You also get to choose between sending/not sending a cover page and putting a header and/or page number and/or time stamp on each page you FAX.

The Dialing Menu is very like the menu used in Flash!, so those comfortable with that terminal program should be right at home using the Joppa FAX software. You can choose multiple numbers to FAX simultaneously (called Broadcast FAX) and you can send multiple documents as well.

You can also choose the time you wish the FAX to be sent. This comes in handy if the document doesn't have to be rushed. Using this option, you can send the FAX when phone rates are lower...and you don't even have to be around to send it! Just leave the modem on and the Joppa software booted.

For those who like to hit keys instead of mousing around the screen, Joppa has added "softkeys" to their software. This means all the major commands, such as sending a FAX or converting the pictures or text, are accessible via function keys or control-something keys.

Finally, Joppa FAX keeps a transfer log of all your transmissions for record-keeping purposes. If you're using the software and have a question about a feature, detailed on-line help is accessible by just clicking the small question mark in most menu boxes.

A Few Cautions

If you're using PageStream, like I do, you should remember to set the Density option in PageStream to 1 if you wish to send a "normal resolution" FAX. If you want to send a fine resolution FAX, the Density option in PageStream should be set to 7. You should then set the corresponding resolution in the Joppa FAX software. Problems can be caused when setting the Density high in PageStream and the resolution low (or vice versa)...your output may not be what you expect!

According to the Joppa FAX manual, choosing fine resolution produces a 200x200 DPI image (similar in quality to a Xerox), while normal resolution produces a 100x200 DPI image. Setting fine resolution increases the actual size of the file and increases the transmission time.

Summing Up

For close to what you might pay for a 2400 baud modem, you can get a Joppa FAX modem that gives you a modem and a FAX as well! If you have a need to send FAXes but don't wish to spend several hundreds of dollars for a device that will just sit around most of its life, get the Joppa FAX!

PRINT ALL THE LANGUAGES OF 1ST WORD AND 1ST WORD PLUS

Don Schmidt (SWAG)

The original HEX file that comes with 1ST Word Plus is missing many of the characters available within the program and the ST keyboard. I chose to rewrite many of the codes and to add the missing characters.

PAN1080I.HEX is the result, and now is able to provide all characters shown in the Font Tables of 1ST Word or 1ST Word Plus. This HEX file is provided on this month's AIM disk.

Many of the characters are custom designs and appear to print in letter quality (actually, they are double struck) even in draft mode. Another flaw is they can't be printed in bold, underlined, italic, light, superscript or subscript.

You need to run the install program for 1ST Word or 1ST Word Plus and use the resulting 1ST_PRNT.DOT or PAN1080I.CFG. If you decide you like and want to use PAN1080I.CFG with 1ST Word Plus, just rename the file to PRINTER.CFG. (Remember to rename or relocate the PRINTER.CFG you are presently using.)

I hope this will be of some help to those who correspond with relatives and friends in the "Old Country."

P.S. Some of you more adventurous types might try using the CFG file with other wordprocessors (it has been successfully tested with Word Writer ST) and have the ability to print out 1ST Word DOCs as well as your own DOCs.

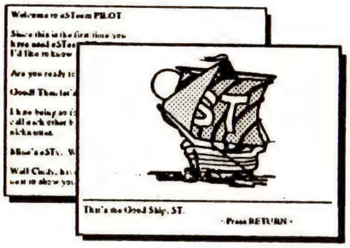
eSTeem™

PILOT

At last, the classic, educational authoring language, PILOT --richly enhanced by GEM-- is available for Atari ST computers.



Now teachers and students, trainers and developers, Atari ST owners and enthusiasts, schools and businesses have a powerful, easy to learn system for creating and using tutorials, computer-based instruction, laser videodisc training and much more on Atari ST computers.

Featuring...
- -- Friendly GEM user interface
- -- DEGAS and EasyDraw graphics
- -- Sound and graphics generation
- -- Module load-and-run and chaining
- -- Point-and-click response options
- -- User password access options
- -- Usage logging and reporting
- -- File read and write capabilities
- -- Laser videodisc and RS232 interfaces
- -- 180+page user's manual

Atari Lynx— No Pussycat!

Terry Thorn (BACE)

I assume most Atarians have, by now, at least heard of Atari's Lynx... the world's most advanced hand-held portable game machine. If you were like me, you heard of it *long* before you actually laid eyes on one. I really hadn't been too excited after what I read about it. Indeed, after reading a "review" of it in *Current Notes*, I was *much* less than enthusiastic about it.

Then I made the big mistake...I ignored the "review" and decided to look at it for myself when it became available in the area. After seeing the Lynx in action, I immediately bought one even though that was *not* my intent.

It was truly a portable color entertainment system with 16 color graphics (out of a possible 4,096 colors), four channel sound, 16 MHz CPU, high quality display and superb games cards that can hold up to, I believe, one megabyte!

The Lynx package comes with a California Games game card. I must admit California Games was quite good, contrary to the "review." What's more, California Games contains the COMLynx option which allows Lynx units to connect for *multi-player* gaming!

Being the inquisitive type, I decided to dismantle the unit. Basically, the design is quite simple. There's just one circuit board with a Citizen LCD screen on top of it. Below the circuit board is a small flourescent light for backlighting the screen. The functions are controlled by some conductive rubber buttons.

There's an joypad that's *very* responsive. Additionally, there's "A" and "B" action buttons and two option buttons whose functions are defined by the game being played. By pressing an option and pause button, the screen display will rotate 180 degrees to facilitate left-handed play!

The Lynx also has jacks for the COMLynx cables and, of course, headphones. The built-in speaker is quite adequate and can get *loud*, as my daughter frequently tests out the volume control.

As I stated earlier, the California Games card comes packed with the Lynx. It's a blend of four games commonly associated with California. There's Surfing, BMX, Half-Pipe, and Footbag.

When I bought the Lynx, I also bought Gates of Zendocon. This is a space shoot 'em up with 52 different levels that's as good as anything on the full-size game machines. Every time I play it, there seem to be aliens appearing that I've never seen before.

My latest acquisition is Blue Lightning which is an Afterburner clone which has gotten high marks in gaming magazines. The detail in Blue Lightning is quite astounding.

Other games available are Electro-Cop, Chip's Challenge, Gauntlet III and Slime World has recently begun shipping! More games titles have been announced such as...

Klax
Red Baron
Check'd Flag
Super Soccer
720 Degrees
A.P.B.
Stealin' Home
Rampage
Vindicators
3-D Barrage
Cyberball
PaperBoy
Rygar
Football
Grid Runner
Junkyard Dog
Time Lords
Pinball Shuffle
Ninja Gai Den
Turbo Sub
Masters Golf
Super Hockey
BlockOut
Ms. Pacman

Graphics on the Lynx are colorful, detailed and very smooth. To best describe the appearance, I'd have to say they're better than the 8-bit's graphics and almost as good as the ST's. The resolution is lower than the 8-bit, but the Lynx's scaling feature and 3.5" screen make it appear to be higher. There is a built-in sprite generator, so lots of objects can be on the screen and you won't notice any slow down.

The screen is easily viewed indoors, but suffers somewhat when viewed in bright light. Outdoors, the colors are washed out. In direct sunlight, you can't really see anything.

I'm very happy with my Lynx and I highly recommend it. I was a little apprehensive about buying it because of Atari's past track record of promoting their products. So far, they have been actively recruiting developers and produced both print and TV ads for the Lynx.

So, thinking about it, there may not be as many games available for the Lynx as for the GameBoy, but I've always preferred quality over quantity. After seeing the GameBoy in action, there's no contest.

The only drawbacks I can pass on about the Lynx are its inability to be used in bright light and its low battery life. But, unlike the GameBoy, the Lynx works very well in the dark and Lynx games are far better.

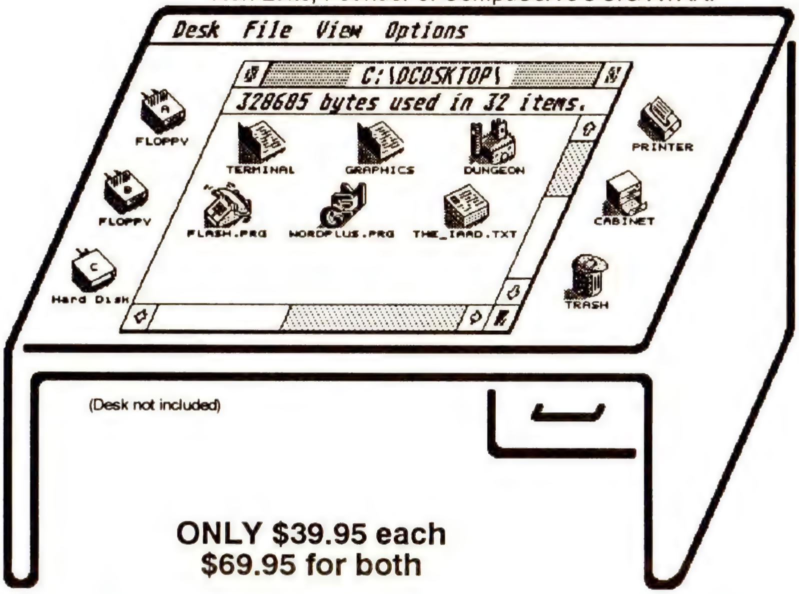
The Lynx is head and shoulders above the competition.

DC DESKTOP

"The GEM Desktop just got better"

New Programs and Features
ONE LOW PRICE!

"DC Desktop is a permanent part of my system."
–Ron Luks, Founder of CompuServe's SIG ATARI



(Desk not included)

ONLY $39.95 each
$69.95 for both

Enhance, don't replace!

- Place programs & **folders** right on the desktop
- Display unique file, folder and drive icons
- Color icons
- Store frequently used files and programs in our exclusive CABINET virtual disk drive
- Display NEOchrome, Degas, TINY,Spectrum, ART director and Mac pictures from SHOW
- View files at the desktop with an enhanced SHOW routine (with mouse control!)
- Replace the desktop with a pattern or picture
- Recover files from the trash
- Spool/queue printing from desktop or program
- Works in all resolutions, STE and TT too!
- Drop down menu commands via keystrokes
- Load different desktops with a keystroke
- Comes with a command line interface, bootup selector, terminal, icon editor, more
- Special hooks let RAM resident programs be called with one key from DC Desktop
- Completely modular and memory resident – only use what you want!

A-T-A-R-I

ANSWERS, TIPS AND RELEVANT INFORMATION

Paul V. Alhart (AFED)

As I promised, this month I have a BASIC "type-in" program for you called DefaultWriter+ Companion #3. This program will allow you to Enable or Disable the RS-232 handler loader routine in AtariWriter+. It will also let you change the screen colors. This program will work on either the 48K or 130XE versions of AtariWriter+. Since these changes are written to your AtariWriter+ disk, some precautions are necessary.

Carefully type in DefaultWriter+ Companion #3. Double check your typing and save it to disk.

Make yourself two copies of the file AP.OBJ from the AtariWriter+ disk. One is for back-up (just in case) and the other is the "working copy" to be modified.

The working copy should be put on a blank, freshly formatted (single density) disk to insure that all the sectors are written contiguously to the disk.

Run DefaultWriter+ Companion #3. Place your working copy of AP.OBJ in drive 1 at the prompt and press RETURN. After reading the current settings, these settings and a menu will be displayed. The settings for an un-modified copy of AP.OBJ should be:

RS-232 handler routine
  Enabled
Character luminance = 15
Background color = 144

If yours are different, Press "Q" to Quit and recheck your typing.

Once you have made your changes and are happy with them, press RETURN to save them to the working copy of AP.OBJ. Copy the working copy of AP.OBJ back to your AtariWriter+ disk, boot it up and give it a try. In the event you have problems, copy your back-up AP.OBJ file to the AtariWriter+ disk and you will be back to where you started.

To make it easier for you to type in, DefaultWriter+ Companion #3 contains no "special characters" and was written to be short and easy to follow. Error checking is minimal for this reason as well. Feel free to "Glitz up" this program as you desire and give copies to your friends.

Merry Christmas and Happy New Year.

```

Basically Speaking

Jeff Summers (ACORN)

The project this month is to write a program that takes ASCII text and converts it to be easily read on your Atari or printed on your printer.

The problem is this: many bulletin board services will, from time to time, carry news releases. These may be new product announcements from Atari, reports from Consumer Electronics Shows (held twice yearly, lots of products are unveiled at these industry shows) or other announcements.

These bulletins are usually in ASCII format, as most computers adhere to this standard. Our Atari 8-bits use ATASCII—short for Atari ASCII—which is not entirely compatable with ASCII. The result is that graphics characters are scattered within the text, there are no returns at the end of lines, and when printed to a printer, characters are chopped off and other problems occur. The greatest reason for this is that ASCII and ATASCII do not agree on what character should be used to mark the end of a line.

Simply stated, the problem here will be to write a program that converts the ASCII end of line sequence to ATASCII RETURN characters. To begin, let's break down the steps involved:

1) Find out the source filename (the ASCII file).
2) Open that file for input.
3) Find out the destination filename (the file that will be ATASCII).
4) Open that file for output.
5) Read characters from the source file. If they are an end-of-line, translate.
6) Write the characters to the destination file.
7) Continue until all characters have been processed.

Now, let's tackle these steps one at a time. First, we need to set up a string array for our filenames. So, for step one, we have:

```
10 DIM FNAME$(20)
20 PRINT "Input filename"
30 INPUT FNAME$
```

Now we have the filename stored in FNAME$. We now need to open the file for input (step 2):

```
40 OPEN #1,4,0,FNAME$
```

Here the 1 refers to which channel we are opening (you have the option of 1-5 for most purposes), the 4 means we are opening the file for reading, and the 0 is meaningless. Next, we will get the output filename and open it for output (steps 3 and 4):

```
50 PRINT "Output filename"
60 INPUT FNAME$
70 OPEN #2,8,0,FNAME$
```

Here the 8 in the open statement means we are opening the file for writing. If the file previously existed, the prior contents will be erased. Also note that we are using the same string. The string contents are changed by our new input statement, and therefore we can save a little memory by using the one string name for two different purposes.

Now we need to read characters from the input file and translate them if they are end-of-line characters. ASCII uses character number 13 to signify a carriage return and character number 10 to advance a line (the ATASCII character 155 combines these functions). So, we need to change all character 13s to 155s and ignore all 10s (step 5):

```
80 GET #1,X
90 IF X=10 THEN GOTO 80
100 IF X=13 THEN X=155
```

Line 80 GETs a character from the input file and places it in variable X. This will be the ASCII value. If it is 10, we ignore it and get another value (line 90). If it's 13, it gets changed to a 155 (line 100). We next dump the character to the output file (step 6):

```
110 PUT #2,X
```

PUT prints the single character with the value specified (in this case X) to the channel specified (in this case 2). Finally for step 7 we need to loop until the whole file has been transferred. But how do we know when the whole file has been transferred? If we simply add

```
120 GOTO 80
```

the program will loop until all characters have been transferred and an error is generated. However, at that point an ERROR - message appears on the screen and you would have to manually use the CLOSE statement to close the files to complete the transfer. Very tacky. Instead, we have the TRAP statement that will catch the error when it occurs and transfer us to another program section. Adding the lines:

```
75 TRAP 130
130 CLOSE #1:CLOSE
   #2:END
```

Now, when the error occurs at the end of the file (the error occurs because you try to read from the file when there are no more characters to send), the program jumps to line 130. At this point the files are closed and the program ends.

I hope this entices you to try working on a few projects of your own.

USING GFA BASIC AND THE RESOURCE CONSTRUCTION SET

Brent Edstrom (ACORN)

I bought my first computer, an Atari 1040 ST, about 15 months ago. Since that time, I have developed an interest in programming. If you are interested in learning how to program, I would strongly recommend getting GFA Basic 3.0 with the compiler.

It has been an absolute joy to use. The editor couldn't be better. GFA Basic 3.0 is also a structured language. This means there are no clumsy line numbers to work with. It also means many of the techniques used are applicable to other structured languages as well.

I wrote the Folder Maker code to show two programming techniques: writing a program for an accessory application and using dialog boxes created from a Resource Construction Set. I would point out you don't need to have a million lines of code to create useful applications.

The Folder Maker listing is fairly short, but I have found it to be a helpful little accessory. I decided to write this program because of an inconvenience I was experiencing when using Word Writer-ST.

Word Writer lets you specify a path name that data can be saved to, but if you forget to set up a folder while at the desktop, you must, as far as I know, save your work to a pre-existing folder or the root directory. Folder Maker lets you create a new folder from within a program such as Word Writer. When selecting this accessory, you can also check the available memory on a disk drive or hard drive.

A word of warning: This program doesn't do any error checking for connected drives. If you try to create a folder on a non-existent drive, your computer will most likely crash! Also, since this program was meant to be run from within another program, Folder Maker, will not update the drive windows. This means you can create a folder from the desktop, but you will not see the folder until the next time you access the drive.

Creating a Dialog Box

To use this listing, you must have GFA Basic 3.0 as well as the GFA Compiler. The first step is to load the Resource Construction Set (RCS2.PRG) from your GFA Basic disk. You will need to create two dialog boxes with the following items and names: Accept the default name of 'tree1' for the first dialog box. Open the dialog and drag two buttons into the box. Name them 'Cancel' and 'OK'.

I find it is most helpful if I use the same variable name as the button text, so type in 'cancel' and 'ok' for the respective item descriptors. The RCS program will automatically assign an '&' for these items.

Drag one more button into the dialog box and label it 'space'. Next, select 'exit' and 'selectable' for each of these buttons. You must have at least one 'exit' button in the dialog box, otherwise the computer will lock up. You may also want to make one of these buttons a 'default' button.

In addition to the buttons, drag two editable text boxes into the dialog. Label the first one 'drive' and the second one 'folder'. For the 'drive' object, leave only one space for text (this will show the current drive). I chose to use 12 text spaces for the 'folder' object, as I wanted to have the ability to make a folder with eight letters, a period, and a three letter extension. You may want to use the following syntax for this item:

```
PTMPLT>
ENTER FOLDER NAME:------------
PVALID>
------------------PPPPPPPPPPPP
PTEXT>
------------------____________
```

Note: the 'P's are used to limit any text entry to valid TOS filename characters.

Create another dialog box ('tree2') and enter the following items: An 'exit/default' button with 'return' as the variable name, a text box with 1 text space titled 'chkdrive' and an editable text box (eight text spaces) with 'memory' as the item name.

At this point, the dialog boxes are complete. For some reason, the RCS2.PRG doesn't automatically create a list file, so you may want to select 'list' as an output option. This will create code that may be directly merged into your program. In the Folder Maker listing, anything with a 'Let' in front of it was merged from the RCS. Select 'Save As' in the file menu and save the resource as FOLDER.RSC.

All that remains is to type in the listing, compile the program and rename the compiled program with an .ACC extension. I hope this source code will be helpful in clarifying some of the techniques involved with using the Resource Construction Set. Perhaps this will inspire you to add some new functions. A disk formatter might be nice, or how about a searching utility?

(Listing on next page)

The CASE Structure in GFA BASIC

(or In CASE of Fire, GOSUB Extinguisher)

Micheal Calvin (SWAG)

Before we start on CASE, a correction for a previous article: TRIM$ does work! My ANTIC manual had the syntax printed incorrectly. The correct syntax for TRIM$ is: a$=TRIM$(b$). Thanks to Mike Sieben of the Atari Federation for letting me know. Mike also pointed out a second error. The "%" variable declaration is a 32-bit integer, and the "&" variable declaration is a 16-bit integer.

Before release of the 3.x series of GFA Basic, the CASE structure was only available to the 'C' and PASCAL programmer. CASE takes the place of a series of IF/ELSE statements and is very useful for menu and shell applications. If there are three or more choices, CASE is better used. CASE uses less code and compiles and runs faster than IF/ELSE.

The syntax for CASE is as follows:

```
SELECT x - x may be a string or numeric variable
CASE y[TO z] or CASE y[,z,..] - y and z may be constants
CASE TO y - from 0 to y are accepted
CASE y TO - y becomes the lowest value
DEFAULT - if none of the defined conditions are met, use
      this option.
ENDSELECT - end of structure
CONT - Insures that the DEFAULT or CASE conditions are
      jumped past if a condition is met.
```

The following program gives an example use of CASE, and how IF/ELSE would be used in the same situation.

```
 ' In CASE of fire GOSUB extinguisher'
 DO ! Think structured
  '  PRINT "[Y]es, [N]o, or [Q]uit?"'
  REPEAT
    l$=INKEY$ ! Wait for user keypress
  UNTIL l$<>""
  ' Using IF, here's the way we'd have to do it....'
  IF l$="N" OR L$="n"! is it N or n?
    PRINT "No"
  ENDIF
  '
  IF l$="Y" OR L$="y" ! is it Y or y?
    PRINT "Yes"
  ENDIF
  '
  IF l$="Q" OR L$="q" ! is it Q or q?
    PRINT "Quit"
  ENDIF
  '
  IF l$=>"a" AND L$<="d"
    PRINT "Why did you press ";l$;" ?"
  ENDIF
  '
  IF L$<>"N" AND L$<>"Y" AND L$<>"Q" AND L$<>"n" AND
L$<>"y" AND L$<>"q"
    PRINT "Key not allowed"
  ENDIF
  ' Okay, using the same input, here's the CASE way'
  SELECT l$'
  CASE "N","n" ! More than one condition, separated with
a comma
    PRINT "No"'
  CASE "Y","y","J","j" ! Multiple conditions (Ja is yes
in German)
    PRINT "Yes" ! I didn't even try to find j in the IF
group!
    '
  CASE "Q","q"
    PRINT "Quit"
    END

  CASE "a" TO "d" ! a range of conditions, defining upper
and lower
    PRINT "Why did you press ";l$;" ?"'
  DEFAULT ! OTHERWISE is an alternate keyword and more
mnemonic
    'PRINT "Key not allowed" ! None of the selected con-
ditions'
     ENDSELECT
     ' Doesn't the CASE method seem more elegant and
easier to decipher? Think of how easy it would be to pick
from a whole bunch of user inputs.......'
   LOOP
```

ADVANCED CO-RESIDENT OPERATING SYSTEM

(HARD DRIVE REQUIRED)

. . . a first step into the future of computers !

SLICCWARE™ introduces new product !

By Randy Foster
President of SLICCWARE™

The introduction of SLICCTOP™ signals the entry of a small high-tech software firm into the micro computer marketplace. Not simply a desktop replacement program, SLICCTOP™ is an integral part of an extremely advanced co-resident, multitasking operating system. As such, SLICCTOP™ can offer a great deal more than any desktop.

No longer need a user abandon the desktop to enter an application. Support is provided for special desktop applications to run concurrently on the desktop with full data sharing. In addition, the user may toggle back and forth between the desktop and any program which uses a standard menu bar -- while applications on the desktop continue their processing uninterupted.

No longer need a user wait while long transfers or printouts are taking place. Processes such as copying, moving, deleting, or printing files, are placed in a queue at the time they are initiated. And because the system is multitasking, the user is immediately free to initiate another process or continue working with his favorite software.

No longer need a user watch helplessly while a process, initiated unintentionally, is carried out to completion. Select CANCEL from the watch box provided, and the process is terminated immediately!

Like organization? SLICCTOP™ allows the user to organize his working environment by installing up to 144 applications, data files and windows for quick access from the menu bar.

Short on memory? SLICCTOP™ uses high speed code swapping to minimize memory requirements; and, if the user desires, may be swapped out almost entirely while executing a program. That is why SLICCTOP™ requires a hard drive.

And the cost . . . **only $49.95 !!**

For more information, call: **(206) 867 - 1786.**

Or to order directly, send $49.95 (check or money order payable to SLICCWARE) to:

SLICCTOP, P.O. Box 2609, Kirkland, WA 98083

The Ultimate Article

Robert C. Arp, Jr.

When this article has been written and published, no other need be written nor published. After you have read this article, you need read no other. Thenceforth, we should expect every magazine to cease publication and every magazine writer to seek some other activity in which to while away the hours.

An absurd idea? Well, such conceit is characteristic of those who proclaim their products to be the "ultimate." Actually, the only thing "ultimate" about those individuals and organizations is their egocentricity.

Is there, perhaps, a particular function that fails within the brain of these egotists—a failure which permits them to imagine that their (usually mediocre) efforts cannot possibly be surpassed by anyone?

I am now looking at the cover of a GFA Basic 3.0 manual which declares, "The ultimate programming language just got better!!" What drivel! Obviously, this programming language was not the ultimate when originally proclaimed thus. Since the new proclamation of "...just got better!!" eradicates the original, the new proclamation is false by definition.

I singled out GFA Basic's claim as an example of a ridiculous advertising trend which seems to be gaining momentum in the ST market because I know the product is competent enough to withstand the criticism. Others I could finger are as worthy of a critique.

I am not trying to generate much ado about trivial matters here—my time is too valuable for that; but I am calling attention to lapses in decorum towards ST consumers. After all, this type of advertising gimmickry reflects the advertiser's assessment of our collective intellectual ability.

Furthermore, I do not rest on my condemnation of the descriptive "ultimate." I also question the proliferation of more modest proclamations such as "fastest," "best" and "most." These, at least, permit consumers to assume that advertisers are claiming such distinction only until the next "fastest," "best" or "most" appears.

However, there can be only one "ultimate" of a thing within the life of the universe—I certainly hope none of the available ST products have reached that plateau. I am amused by the frequency of updates generated for these "ultimates."

The impact of advertisements which depend on nonspecific superlatives is not as effective as those advertisements which emphasize particular product features. Contrast the "ultimate" genre with the ads for Calamus and DC Desktop.

I now turn your attention to ads which have no impact at all because of poor layout and design. The most immediate example I have is for the products of Innovative Concepts. In this case, my criticism is I that can't read the ad—the typeface causes too much eyestrain.

Another type of unreadable ad uses too much color; another type obscures text with an incompatible background. When these techniques are used within a magazine article, the article is not read. When used within an advertisement, the advertisement is not read.

Typeface too small—see the Good Backup Utility ad. Specificity of features lost via layout—see the Diamond Back ad. Typeface and layout utilized for maximum advantageous impact—see the ABCO Computer Electronics Inc. ad. *[Eds: Thanks Robert, since that's the only ad you mention that we had a hand in designing!]*

I've gone this far, so I might as well point out an ad that is too busy—Artisan Software; an ad that is not—Codehead Software; and an ad in the middle—Branch Always Software.

In conclusion, I suggest to competent developers that the use of nonspecific descriptives automatically attaches to your products the stigma usually reserved for the incompetent. How about exercising a little modesty—lest your hand be called.

Happy New Year

Fool's Errand

Bill Magro (CUSTUG)

If you're tired of games which rely on luck more than skill or you've played one too many shoot-em-ups, The Fool's Errand (TFE) from Miles Computing may be for you. TFE is an adventure game, of sorts, but it is unlike any adventure game you may have seen before.

Gone are the traditional annoyances of adventure games: there are no difficult-to-maneuver characters, you cannot 'die', and you aren't racing a clock to finish. Consequently, you won't find yourself constantly starting over. All progress is permanent, and since you won't finish in one sitting, games can be saved.

As the game player, you unravel the story of a fool wandering through a strange land in search of wisdom. Viewing the Prelude, you learn from the Sun that your goal is to recover the 14 Lost Treasures of the land. The Sun gives you a map of the land, but it is unreadable because many parts are missing and those that are readable are scrambled.

You, as the Fool, visit 80 places, each accompanied by a puzzle. Upon successfully solving each puzzle, you recover a piece of the Sun's map and another passage in The Story, which chronicles the Fool's journey.

The puzzles vary widely in nature but share one common feature. The solution to each is via skill and logic. Some are trivial; some will baffle you for a time. TFE has mazes, words and pictures to unscramble, cryptograms, word searches, a card game (the rules of which you must discover) and many others which are not easily classified.

Each puzzle comes with its own instructions, though the instructions sometimes tell you no more than to "solve the puzzle."

At the start, about 20 puzzles can be accessed. Solving a puzzle often gives you access to another place to visit. In this way, each of the 80 places (and puzzles) can be reached.

Even when all the puzzles are solved, your task is far from complete. The Sun's Map is, itself, a puzzle which must be unscrambled. Once put in order, the Sun's Map contains further puzzles. Using clues, which are embedded in The Story (and clearly set apart by blue or red letters), these final puzzles can be solved, revealing the names of the 14 Lost Treasures. Entering the names of the Treasures entitles you to view the Finale, which concludes The Story and the game.

Technically, the program is excellent. It is provided on four non copy-protected disks, which can be copied to a hard drive. Copy protection is afforded by means of a "code wheel," which sports three concentric disks that rotate to generate 1331 possible positions and result in 121 different codes. Looking up the access code is almost fun.

The program is very responsive, and seems to be bug free. Interaction with the puzzles is intuitive, with most screens accepting both mouse and keyboard input. Most of the puzzles contain striking screen art which is relevent to The Story and occasionally essential to the puzzle's solution. Tremendous effort was expended on the art and in the programming of this game, and the results are worthy of that effort.

Though a fine program, TFE is not without its shortcomings. The puzzles may disappoint you late in the game. They do not get much more difficult than the initial puzzles. Solving a few classes of puzzles becomes rather routine after a short while.

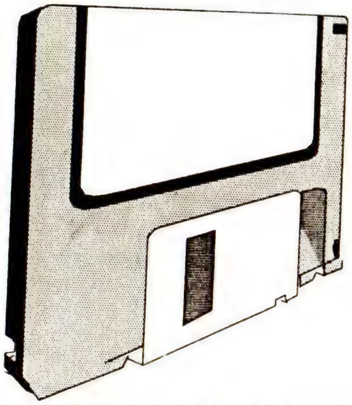
My partner, Lisa (a word puzzle wizard), and I finished the game in approximately ten hours.

The Story, too, is a trifle disappointing. Devoid of plot or message, it seems to exist solely as a medium for the provision of the final clues. It is chock full of nonsense words which are integrated quite roughly into the Story.

The game itself possesses a plot. The Story, however, does not contribute significantly. Unlike LucasFilm's Loom, you won't want to replay this game solely for its enchanting story.

The puzzles are the heart of this game, and solving them is where you will enjoy yourself. There are many different kinds of puzzles, and many are creative and clever in their solution. Hopefully, the next game in this series will incorporate more of these challenging and interesting puzzles.

The Fool's Errand is a game to be played with someone. You will collaborate when boggled and celebrate when you triumph. Though sometimes disappointing in its simplicity and unrewarding in its completion, it is, most importantly, always a lot of fun.



AIM Disk of the Month January 1991

All files on this disk are self-extracting LZH archives created with Double Click's Self-Extracting ARC program DC SEA! To use these programs, simply double click the files. Then, click on Extract and select the drive/folder to which you want the extracted files saved. Click on Verbose to get a list of the files in each archive or Exit to abort.

Here's a short description of the files on the January '91 disk. For more complete documentation, see the text files contained in most of these archives.

BACKUPST.APP—Hard drive backup by Fred Appleman of the University of Utricht in the Netherlands. Uses a proprietary data-stream format to create fast image backups but can backup/restore (interactively) individual files and folders. Full English docs included.

BIGBUX.APP—Answer your money questions! Does depreciation, mortgage, commercial paper, investments and much more. Shareware.

DC_SLICK.APP—DC Slick Shift, freeware from Double Click. Uses Control, Alternate or Shift keys to emulate mouse buttons.

DTERM1.APP—Dterm 1.0 terminal program, now with auto dialer, capture buffer/viewer and auto Zmodem. Scan dialing and unlimited redials, Macros and strings for each number. Shareware from the authors of Cheetah.

EASYTEXT.APP—PD Desktop Publishing package from England! Can use GDOS fonts, but works without them as well. Import Degas pics and much more.

GOGOST21.APP—GoGo->ST is a file executor that replaces the GEM desktop, speeding up your access to programs and documents. Version 2.1 allows lists to be loaded from a "button" on the main GoGo desktop. Shareware.

GSLAM231.APP—GramSlam Grammar Checker improves the quality of your writing. Looks for incorrect, awkward or wordy phrases, describes the problem in easy-to-understand terms and offers suggestions for improvement. Runs as PRG or ACC. DEMO (10 sec delay after each action).

KV_GEO2.APP—Explore the Sun/Earth/Moon relationship with animations and information. Includes an animation of the full Apollo mission, with descriptions of each stage. Low rez COLOR. Shareware from Knowledge Vine.

MONOMON.APP—English version of MonoMon 2.2. from Germany, a disk editor utility that also formats, copies and checks for viruses. MONO only.

MORTGAGE.APP—Mortgage/Loan calculation program with options for early payments and more. Submitted to AIM by the author.

NAMETUNE.APP—Name This Tune, for 2 players. Identify songs before your opponent. Use synthesizer or ST speaker. Includes a program for making music files. Medium rez COLOR. Shareware.

PAN1080I.APP—Printer driver for 1ST Word/Plus that accesses all foreign and special characters, from Don Schmidt (SWAG).

PINGAME.APP—Classic Pin Game as an ACC, written by Ed Smith of SPACE. GFA source listing included.

STATS.APP—The STATISTICIAN is a PRG/ACC that reports the status of your system and drives. Displays TOS version and date, GEMDOS version, Blitter, System time/date, floppy write verify/seek rate, Capslock, memory map with graphical display and info on all disk drives. Some options settable by the program. Shareware from Structured Technology.

ST_TYPE.APP—ST Typewriter lets you use your printer as a typewriter. Set Pica or Elite, DPI and more.

TUNES.APP—Disk (111 songs) of MIDI files set up for use with Name This Tune. Extract to a blank disk.

XYZ2.APP—XYZ transfer utility 2.0. Upload and download with XModem, YModem and ZModem. New options include estimated transfer time, support for running unattended, enhanced disk error recovery.

Readers can purchase this disk from their local AIM Participating user group or by sending $6 ($5+$1 S/H) to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. Please specify the January '91 disk when ordering.

DMC

OUTLINE® ART

Outline Art is a vector- oriented, graphic generation tool. Multiply your creativity through the many functions which you will find in this program.

Outline Art supplements the Calamus desktop publishing system with a great number of new functions and effects. An extract from the extensive list of functions include:

- A user interface, quite similar to that of CALAMUS.
- Complete Vector Graphics Editor for lines, Bezier curves, control paths etc..
- Capabilities to generate freely-definable raster areas.
- Creation of rayed objects, ie; from a font to a central point.
- Nearly unlimited possibilities for the manipulation of text, characters and text attributes such as:
  - rastered, transparent, outlined, rotated, stretched, compressed and cursive styles...
  - circular text and text along a freely-defined vector path...
  - projection of raster areas and text on vector outlines...
  - conversion of text into vector objects...
  - kerning functions...
  - Functions can be freely combined and applied to all Calamus fonts.
- Integrated, fully programable calculator with a pre-defined and extendible library of transformations such as:
  - shift, rotate, mirror, enlarge/ shrink, project onto a sphere (globe, cylinder, cone), etc..
  - An intelligent clipboard and copy functions, allowing the automatic generation of transformation sequences.
  - loading and saving in .CVG format (Calamus Vector Graphic), making possible the integration into and optimal printing through Calamus on all supported output devices in all resolutions.

Convert 2X, our new program to convert CVG (Calamus Vector Graphic) to EPS (Encapsulated PostScript®) or PS (PostScript®) file format is included with Outline Art.

Note : **DynaCADD**, our complete 2D and true 3D Computer Aided Design and Drafting Package, allows the importation of Calamus Vector Graphic format, (CVG), which can then be output through all devices supported by DynaCADD, ie: CAMM-1, Plotters etc,... An excellent solution for the Sign Making Industry.

AYERS ROCK

Outline Art with Convert 2X retails for US $289.95.

AAAUA ATARI 8-BIT USER GROUP

Alamo Area Atari User Association (AAAUA),P.O. Box 79-1426, San Antonio, TX 78279-1426

The AAAUA is an Atari 8-bit user group serving the greater San Antonio area. General meetings are held on the first Tuesday of each month at the Balcones Heights Community Center, 107 Glenarm, San Antonio, Texas, from 6:30 to 9:30 PM. General meetings feature a presentation and small group problem solving. Each third meeting we have a swap meet and computer workshop.

Members receive a subscription to AIM as part of their benefits. Dues for regular family membership are $24 per year or $15 for six months. Dues for "Subscribing" membership has been increased to $15 per year domestic and $18 per year for most foreign countries due to increased costs. Subscribing members receive a subscription to AIM and (FR)ANTIC, and have access to our P.D. Library. For further information, call Al at (512) 492-6633.

President	Alvan Sherrill
Vice-President	Billy Washburn
Secretary	Sheila Kepner
Treasurer	Joe Barth
Public Relations Officer	Bruce Davisson
Librarian	Russell Gibson
Newletter Editor	Manuel Garcia

Presidential Ponderings—November was election month for AAAUA. The new board consists of the names shown above. Thelma Sunvison and Ed Sekula were re-appointed as "Special Assistant to the President" and "Hard Copy Librarian" respectively.

My thanks to the membership for your vote of confidence in supporting me for another term. I could not have done my job without your support and without the support and hard work of your board of officers and appointees.

My thanks especially to Jose Borrero for serving as vice president for the six months remaining when John Hardie moved to New York. The cooperative and dedicated efforts of all of you have made AAAUA what it is today. My thanks to each and all! I also want to welcome newly elected Vice-President Billy Washburn and Newletter Editor Manuel Garcia to the board. I know you will do all in your power to continue making AAAUA the best user group possible.

The AAAUA/SALSA AtariFest held on Saturday, November 3rd, was a moderate success with a total of about sixty persons, including about twenty non-members attending. SALSA stands for the ST Atari League of San Antonio which was formed by a group of AAAUA members who acquired their STs around 1984. This was the first joint meeting of the two user groups.

Food was in abundance, thanks to Kyle Miller (SALSA) and Rose Marie Pettit (AAAUA). $200 worth of prizes were awarded to winners of the ST Midi-Maze and 8-bit BallBlazer contests. Everyone had fun playing a number of different games, playing midi-music and just generally enjoying good conversation. We have hopes of having a similar joint meeting next year.

Now, an urgent message to everyone, AAAUA members and non-members alike, regardless of where you live. If you want the Atari, especially the 8-bit Atari, to remain a viable computer option, then we, the Atari users, must band together and support it. How? By joining and participating in a user group, by supporting publications such as AIM, and by urging others to do the same.

Let's face it! Commercial support is sadly lacking. Many commercial outlets and publications have abandoned Atari in pursuit of what they perceive as "big bucks" in MS-DOSland. By default, the responsibility has fallen upon us, the users. So, JOIN the user group where you live. If there is no user group where you live, I invite you to become a subscribing member of AAAUA. Then, PARTICIPATE!

Write an article on any relevant subject, technical or non-technical, for publication in your user group newsletter and/or for submission to AIM. Let's spread our knowledge and expertise about computing and the Atari to all who would benefit by becoming part of the Atari community. This is the only way we can ensure the survival of our cherished Atari computer. Will you join with me in pursuit of this goal?

ABLE

The Atari Boosters League East (ABLE) meets monthly with enthusiasts and provides user support for all Atari computers except the Portfolio and PC line. The purpose of ABLE is to advance the knowledge of the membership through mutual education and the interchange of ideas.

General meetings are held in the Palm Magnolia Room at the Orlando Public Library, 101 East Central Blvd., on the last Sunday of each month from 1:30 to 4:30 P.M. ST SIG special interest meetings take place in Room 134 at the Bush Science Center on the Rollins College campus on the second Wednesday of each month from 7 to 9:30 P.M. Ad hoc meetings are scheduled as needed to present speakers, conduct special workshops, provide tutorial seminars and for parties. We assist members in service and software problems, as well as arrange group purchases and discounts.

Information is disseminated to members through our newsletter, the ABLE Atari Information Digest (ABLE AID). A package of twelve selected previous issues of ABLE AID higlighting the "super eight" computers is available for $10 ($5 for members). In 1990, ABLE began participating in the Atari Interface Magazine.

ABLE accepts written correspondence at P.O. Box 1172, Winter Park, FL 32790, while membership inquiries are handled by Hadley Nelson, President, (407) 671-0317 or Milton Eager, Treasurer, (407) 834-0581. Annual dues are $12.

ACCT

Atari Computer Club of Toledo club members receive, as part of their dues, Atari Interface magazine and access to the 8bit and ST public domain software libraries. Disks are $2/8bit and $4/ST. Non-members may purchase disks at a slightly higher cost.

ACCT meets on the second Monday of the month, from 7-9 pm at Bassett's Health Foods, 3301 W. Central Ave (Westgate Shopping Center), Toledo, OH. ST Sig held monthly at the home of David and Brenda Micka. Dates and times announced at meeting. ACCT may be contacted at 4487 289th, Toledo, OH 42611 or by calling Dave Micka at (419) 729-1891 or Michael Justice at (419) 242-7797.

President	David Micka	(419) 729-1891
VP	Michael Justice	(419) 242-7797
Secretary	Sharon Hill	
Treasurer	Rose Taylor	
ST Librarian	Brenda Micka	
Disk Drive-Thru BBS		(419) 885-3441

ACORN

Atari Computer Owners of Rochester New York

The Atari Computer Owners of Rochester, NY (ACORN) meets on the 2nd Wednesday of each month at Brighton High School, room 314N. Before each meeting, a STarter class for the ST meets at 6:45 PM in room 242S and a Basically Speaking class for the 8-bit starts at 7:00 PM in room 314N.

ACORN operates a BBS at (716) 436-3078 with 40 megs of public domain downloads for the 8-bit and ST systems. Our mailing address is POB 23676, Rochester, NY 14692.

Dues are $18.00 per year which includes access to the club's PD libraries, enhanced access to our BBS, and subscriptions to our newsletter, the ACORN Kernel and to Atari Interface Magazine.

President	Don Allis	(716) 293-3415
Exec VP	Albert Yarusso	(716) 244-4487

December Hi-Lites—We held our annual auction at the November meeting. Many 8-bit left satisfied with the "new" programs they bought for their machines and the ST'ers we please with the bargains they got on hardware and software for their machines.

At the December meeting, Kernel Editor Candi Nelson will demonstrate PageStream and how the Kernel is put together.

The ACORN BBS is available to all Atari users. The number is (716) 436-3078 at 3/12/2400 bps.

Atari Computer Owner's Resource Network

ACORN, the Fort Wayne area Atari users group, meets at the Georgetown branch of the Allen County Public Library on the first Saturday of each month beginning at 10 AM. Annual membership dues are $18 which includes access to our library of 8-bit and ST software, magazines, books, and hardware; member's privileges on the BBS; the monthly newsletter; and a membership card good for discounts at some of the local stores.

Kim Stahn	Treasurer
Karl Fadus	Librarian
Ken Helms	Secretary/Newsletter Editor
Our BBS	(219) 744-1396

B.R.A.C.E.

Bluegrass Region Atari Computer Enthusiasts

B.R.A.C.E. (Bluegrass Region Atari Computer Enthusiasts) meets the third Sunday of each month from 1 - 4 PM. Current membership dues are $15 per year for an individual membership, $20 per year for a family membership and $10 per year for an associate membership. (An associate membership includes receiving the monthly newsletter, but excludes the use of the library.) Members of have extra privileges on The Abyss BBS (606) 223-2782.

President	Hal Nason	(606) 269-8989

ATARI FEDERATION

Regular meetings are held at the VAFB Federal Credit Union, Vandenberg Village, Califorina on the first Monday of every month at 7:00 P.M. Dues are $10 for individual or $15 for family membership. The Atari Federation maintains a PD software library for both 8-bit and ST computers.

President	Phil Rominger
Vice President	Bob Ribortone
Secretary	Matt Matias
Treasurer	Herb Kanner
Newsletter Editor	Jerry Sullivan
8-Bit Librarian	Chester Hadley
16-Bit Librarian	Charlene Rominger

Secretary's report: November's meeting was pretty light, mostly just a friendly bull session. However, Phil did manage to review some of the Atari world's news (nothing great this month). One of our members demo'd 'Assistant Chef'. The demo was good, the program could use some refinements. For a little extra entertainment, Phil demo'd a few of the programs on the disk of the month. To finish off the formal part of the meeting, we voted on AIM's future options. The vast majority would prefer AIM to maintain the same price and mailing and improve size and quality.

Birmingham Atari Computer Enthusiasts

The Birmingham Atari Computer Enthusiasts of Birmingham, Alabama meets at the Vestavia Hills Library downstairs at 7:00 p.m. the second Monday of each month. Membership dues are $20 for a regular membership,and $35 for a professional level membership.

Mark Bodenhausen	President
James Gilreath	Vice President
Brenda Bodenhausen	Secretary
Steve Yates	Treasurer

For membership information, contact Steve Yates, 1005 Candy Mountain Road, Birmingham, Alabama 35216.

Our BBS is at (205) 833-5012. This is both a voice and data line. To access the BBS, press 1 after the first ring. For voice, press 2. After 6 rings, 2 is automatically selected.

BRAG ST

Buffalo Region Atari Group for ST's

BRAG ST was founded in 1987 to serve Atari ST owners in the Western New York area. General Membership Meetings are held on the third Thursday of the month at Erie Community College North Campus, Room S-105 in the Student Center. Setup begins at 7:00 PM; Meeting starts 7:30 PM. The Board of Directors meet on the the first Tuesday of the month at the Your Host Restaurant, Harlem at Sheridan at 7:30 PM. All are welcome to attend. Piracy will not be tolerated at any BRAG ST function.

BRAG ST, PO Box 1035, Buffalo, New York, 14225

Chairman	Mark Pierro	(716) 691-7844
Vice Chairman	Ken Malark	(716) 683-1272
Finances	Gerry Genson	(716) 877-1328
Records	Joe Rogozinski	(716) 877-8378
Disk Librarian	Carl Barron	(716) 885-4325
Public Relations	Harvel Hontz	(716) 689-8074
Graphics	Dick Kersting	(716) 839-0494

BRAG ST—The October 18, 1990 meeting was called to order by Mark Pierro at 7:30pm; there were 20 members present.

We started out by explaining that the MIDI demonstration by Don Missel has been permanently canceled due to Don's inability to schedule a date with us. Club member Burt Royce then agreed to put on a demonstration at the November meeting. Thanks, Burt!

Nominations were opened for the four(4) Board of Directors positions whose terms were about to expire. Re-nominated were: Mark Pierro, Gerry Genson, and Joe Rogozinski. Also nominated was Dane Stegman. Voting will take place at the November meeting.

Mark discussed with the members the MiGraph Hand Scanner and Touchup software user group offer. Then the list programs available on the AIM Disk of the Month for November was passed around.

Mark then discussed with the club about buying a 20" TV/Monitor for presentations at club meetings. A motion was made and passed to spend up to $275 for a TV/Monitor. Mark said he would investigate into what brand would be the best to buy. Our first demo was "Space Ace", demonstrated by Mike Stringer. We all sat in awe as Mike breezed through the game - the graphics were fantanstic, like watching a cartoon! Then Mike showed us Speed Ball, in another excellent presentation. Next, shareware games from The Knowledge Vine, KVHouse, KVMatch and KVGeo were demonstrated by Mark. These are excellent learning games for children ages from 3 years and up. These programs are all available on AIM's Disks of the month. At the break, disk sales were brisk and our software raffle winners were: "Lucky" Joe Rogozinski, KillDozer; Burt Royce, Gauntlet.

An informal open forum continued to the end of the meeting, while members enjoyed cider and donuts in keeping with the spirit of the season. The meeting closed at 9:40pm.

CACE

Cascades Atari Computer Enthusiasts

Cascades Atari Computer Enthusiasts is the Atari Club in and around Jackson, MI. The CACE BBS is run by the club and open to everyone. The number to call is (517) 764-4047. Current membership dues are $14.80. Any written communication with CACE should be sent to PO Box 6161, Jackson, MI 49204. Our meetings are held on the second Saturday of the month fro 1p.m. to approx. 4p.m. at the Boos Recreational Center. For more information, contact Brent Fisher at (517) 764-4599.

COOKEVILLE ATARI COMPUTER ENTHUSIASTS

A.C.E.

C.E.V

Cookeville, Tennessee

Cookeville Atari Computer Enthusiasts—c/o Robert Pecora—280 Capshaw Drive—Cookeville, TN 38501—Cookeville A.C.E. meets on the first Saturday of the month at 1:00 p.m. at the Putnam County Library in Cookeville, Tennessee.—Cookeville A.C.E. caters to Atari ST and 8-bit computers and is supported locally by The Generic BBS, Terry Rapp - Sysop.—C.A.C.E.

President	Dan Hale	(615) 526-8002
Secretary	Robert Pecora	(615) 528-7116

CUSTUG

Champaign-Urbana ST Users Group

The Champaign-Urbana ST Users Group (CUSTUG) meets at 7pm on the second Wednesday of each month in the Auditorium of the Urbana Free Library at the corner of Elm and Race in Urbana, IL. Membership dues include a subscription to AIM and GLITCH and use of the commercial lending library. New members are welcome. The group supports a local BBS, Blackhawk's Keep, operating 24 hours a day at 3/12/2400 baud (1/8/N): 217-892-5512.

CDACE

Capital District ATARI Computer Enthusiasts

The Capital District Atari Computer Enthusiasts was founded in 1981, is located in Albany, N.Y. and serves Albany, Schenectady, Rensselaer, Saratoga and surrounding counties in upstate New York. XL/XE meetings are currently held on the third Wednesday of the month and ST meetings on the last Wednesday of the month. CDACE meetings are held at the Computer Cellar, located in Westgate Plaza, Albany, New York.

The club has extensive public domain libraries for both computers which are available to members beginning at 6:30 PM on meeting nights. ST-based disks are priced at $2 while the XE-based library continues to remain free to all members.

Dues are currently $20 per year for each family. This includes a subscription to AIM magazine, full access to the club BBS, and our monthly newsletter. The club actively promotes the use of all Atari computers through demonstration and application and welcomes non-members and share ideas.

BBS Sysop	Dave Hagan	682-2452
Librarian	J.D. Johnston	682-2883

Well, another month has come and gone and still we are waiting on any new word for any enhancements to the ST or the new TT.

Hope something happens soon. The general membership attendance at the meetings is still low. Any of you members out there that need help or just want to talk about your Atari come out and join the fun the 3rd Thursday of each month at 7 PM. Bring a friend. The meeting in December is our annual graphic's contest for all members. Last year was a lot of fun and we saw some really good graphics drawn by some young artists. Make sure you attend and bring any graphics you or your kids have drawn. Remember, they must be composed on any Atari drawing program and must be of original design.

I look forward to seeing everyone at the meeting. If you have any new information you would like to see included in our new newsletter, let me know by the 1st of the month so we can get it included in the President's Letter.

GRASS

GRAND RAPIDS ATARI SYSTEMS SUPPORTERS

GRASS meets the first Wednesday of every month at the Wyoming Public Library, 3350 Michael S.W.. Doors open at 6:30, meeting starts at 7:00pm. Dues are $22.00/yr. including AIM. Bring in one PD software disk and get 2 blank disks for your time.

Tim Feenstra	President	(616)249-9742
2239 Collingwood SW., Wyoming, MI 49509		
Greg Williams	Vice President	(616)698-7319
George Nosky	Treasurer	(616)942-1527

Chuck Baughman	Librarian	(616)795-7373
Gerry Borysiak	Membership	(616)896-9358
Charlene Bird	Co-Librarian	(616)795-3593

President's Monthly: 17 November, 1990—Merry Christmas everyone. It seems a little strange to be saying this before Turkey Day, but that's the way it goes when you write stuff more than a month ahead. I wish you all a happy and safe holiday, and hope you get at least some of the new toys you have on your lists.

I would like to report success repairing my broken XF551 drive, by installing some jumpers to the port connectons on the bottom of the board. It was not hard at all, but sure seems like Atari could have made these more secure so that the problem did not occur in the first place.

A little closer to home here, I have been told Childrens Palace has a few 8-bit titles for sale. Games, but then anything is better than nothing. Even mail order is getting tight, with only a couple places left with much of a selection. At least companys like ICD still have some great stuff for us.

January is vote time for GRASS, so make sure you come to the meeting to get your vote counted, you even have time to get into the running for your favorite office yet.This is your chance to get the group heading in the directon YOU WANT. Your opinion is important, the group is here for you, but you also have the obligation to make your views and desires known. Enough said.

See you all at the meeting, and once again, best wishes to everyone this holiday season.

G.T.A.U.G.

The Newsletter of the Golden Triangle Atarian

Congratulations to all the officers and thanks to last years group. May we all have a fine year in the GTAUG! The GTAUG has been 'around' since 1981 and supports both the 8-bit and 16-bit communities. Meetings are held the first Tuesday of each month at a location announced in the previous meeting.

At present our dues are $24 per year (Our year begins in September.) and is pro-rated at $2 per month for new members the first year. Since our nearest dealer is 90+ miles away, it is imperative that we support each other. It is for this very reason our group is a fairly close and diverse. We support all facets of Atari computing from 8-bit to Spectre/Mac to IBM and MIDI.

President	Carl Neblett	(409)755-6535
Vice President	Bob Lisle	(409)832-5659
Treasurer	Charles (Butch) Foster	
Secretary	Joe Bryant	(409)839-8645

HACE

The Houston Atari Computer Enthusiasts meet on the fourth Wednesday of the month, 6:45pm at the Health Economics Corporation, 2400 West Loop South, in Houston, Texas. The club supports all Atari computers from the 400 to the Mega4.

Membership is $22 per year, and gives full access to our BBS (713) 458-9923, access to our disk, magazine and newsletter libraries, a subscription to AIM, and our local news journal UPDATE ATARI. There are also other benefits, such as store discounts, door prizes, workshops, telephone help when you have problems, and much more! For more information, please contact one of our officers or drop us a line!

HACE, P.O.Box 460212, Houston, TX 77056

President:	Bill Kithas	713-855-0815

LBACE

The Long Beach Atari Computer Enthusiasts meet on the second Sunday of the month at 6:00 pm. Meetings are held at Mercury Savings and Loan on the corner of Long Beach Blvd. and Carson in Long Beach. Address is PO Box 92812, Long Beach, CA 90809.

President	Richard Hull	(213) 422-1055
Vice-president	John Saunders	863-2582
Treasurer	Pat Connelly	
LBACE BBS		498-8824

Club dues are $20 annually. The club supports both the 8bit and ST. Members have access to the club's PD library and BBS and receive a year's subscription to Atari Interface Magazine.

JACS

Jersey Atari Computer Society, P.O. Box 710, Clementon, New Jersey 08021. JACS BBS: (609) 346-1224

The Jersey Atari Computer Society (JACS) provides a forum through which members may further their understanding and enjoyment of all Atari computers, through the exchange of ideas and information with other users.

JACS holds two meetings per month at the Camden County Library, across from the Echelon Mall in Voorhees, New Jersey. The executive meeting, where all the planning for the club takes place, is held in the 2nd floor meeting room from 7-9 PM (meeting dates vary from month to month). The regular JACS meeting is usually held on the third Tuesday of each month, in the 3rd floor meeting room from 7-9 PM.

President	Mike Hopkins	227-9058
ST Vice President	Maureen Kelly	428-9381
Treasurer	Forrest Blood	877-3579
Recording Sec'y	Gary Mickus	767-1933
Membership Chair	Al Guretse	596-7567

The regular monthly meeting includes topics of interest for users of all Atari 8-bit (400/800 & XL/XE) and 16(ST/Mega) computers.

Layton ACE of Utah

The Layton Atari Computer Enthusiasts (L.A.C.E.) membership cost $20 per year. Privileges include the AIM Monthly Magazine, access to the 8-Bit and ST club libraries, monthly meetings, help and friendship. If you are presently not a LACE Club member and wish to join contact the one of following persons or write to LACE, c/o Irwin Brooks, 3897 So. 2275 W., Roy, UT 84067-3515.

Irwin Brooks,	President/ST Librarian	(801)731-1516
Richard Clark,	Vice President	(801)825-5823
Ken Karchner,	Secretary/Treasurer	(801)776-8015
Lonnie Allen,	8-Bit Librarian	(801)392-4450
Kelly Knecht	ST Librarian	(801)773-5652

The L.A.C.E. Club Meets in the basement of the Clearfield Library every second Wednesday of the month at 7:00 p.m.

Mark your calendars for the next meeting: December 12, 1990.

MID-OHIO ATARI USER GROUP

Mid-Ohio Atari User Group Post Office Box 134, Ontario, OH 44862

The Mid-Ohio Atari User Group supports all models of Atari computers. We meet at A&B Computers, located in the West Park Shopping Center on Park Avenue West in Mansfield. Meetings are held the third Saturday of each month from 7:00pm to 9:00pm. Demonstrations are welcomed and pirating is expressly forbidden.

MAUG is a participating club in the Atari Interface Magazine. As such, members receive an issue of A.I.M. each month for no extra charge. Club dues are $7.50 per year for residents of Ohio, and $10.00 per year for others. A monthly disk subscription is an additional $3.00 per year if you pick your disk up at the meeting. Disk subscriptions which must be mailed are an additional $24.00 per year.

The club maintains a disk library for both the 8-bit and ST computers. The library disks are made available at each meeting. There is also a message base on the DataQue Support BBS members to use. Anyone wishing to become a M.A.U.G member can contact Chuck Steinman at the club address or call the DataQue Support BBS at (419) 529-5197 and leave email to the SysOp.

M.A.C.E.

The Michigan Atari Computer Enthusiasts

Members of MACE receive, as part of their dues, Atari Interface Magazine. Members are also entitled to purchase disks from the 8-Bit and ST public domain software libraries. 8-Bit disks are $3 each, and ST disks are $4 each. As an added bonus, if you purchase three (3) disks from either library you will receive a fourth disk of your choice at absolutely no cost. Non-Members may purchase disks at a slightly higher rate. Mail order is also available.

For a catalog of current disks in our libraries, send $2 to:

MACE, P.O. Box 2785, Southfield, MI 48037

MACE meetings are held on the Third Tuesday of each month at the Southfield Civic Center at 7:30pm. The Southfield Civic Center is located at 10 1/2 Mile and Evergreen Rd, one half mile south of the Evergreen exit on the new I-696. Meetings are in the small pavilion, room 115. Parking is available in the parking garage below the pavilion or in one of the many parking lots on the Civic Center grounds.

If you have any problems with getting to the MACE meetings, please feel free to call on a MACE Officer to relieve you of your confusion. We are always glad to extend a helping hand!

Please come and join us! We are awaiting your visit!

Middle Georgia Atari Users Group

M.G.A.U.G.

The Middle GA Atari Users Group is the sole Atari Club in the Middle Georgia area. We are composed of 60 members of which approx. half are ST users. Club president Pete Miller can be reached by phone at 912-328-8758. The MGAUG address is 115 Feagin Mill Rd., Warner Robins, GA 31088. MGAUG meets the second Sunday of each month at 1 PM at the Warner Robins Library. Annual dues are $5 with the newsletter optional. Use of the club library is free to all paid members.

November Meeting

The November meeting saw another great turnout with 18 members able to stir themselves. Lee Benjamin was nice enough to once again bring his computer to the meeting. It seems that only a few people are willing to put the extra effort forward to make the meeting enjoyable. I beleive that everyone gets much more from the meeting when there are at least 2 computers present.

We voted at the meeting to purchase the AIM disk for the club instead of the club president, me (grin), working on the disk each month. I will still offer programs myself but I will not be compiling a Disk of the Month. The great people at Unicorn Publications (Bill & Pattie) asked members to vote on which direction that they would like to see the magazine to go in the Future. The members unanimously voted they would like to see the magazine expanded, even though it means it will still arrive a little late each month.

At the meeting we talked about which way that Atari is moving and I was hoping to hear of some new members this Christmas but I havn't heard of anyone mentioning buying a new computer. The Atari market in the U.S. (to me) seems to be on the down-hill, it seems like deja-vu of the old 8-bit days. On the up note though Atari seems to be still going strong over seas and we have all enjoyed some of the benifits of its popularity over there. According to Computer Gaming World 80% of all entertainment software is bought for IBM and 10% for Amiga. Atari was not mentioned. At the local discount wholesalers I have noticed a lot of interest in the Packard Bell VGA systems, the graphics are great.

Christmas is coming and there are a lot of sales going on especially at the club. We have about 20 programs (games) that we have for sale for $6 each. Most of them are old Epyx and Rainbird games.

What's New: Jimmy Wallace brought his new Sim City game to the meeting to demonstrate. Is it a game or a simulation? I'm not sure but it looks like it could be quite addicting, much like Empire.

At the next meeting I will have M1 Tank Platoon from Micropose. I just now got it so I haven't had much time to play it. I hope that by the meeting I will be a full fledged tanker.

Well that's about it for this month. I hope to see you at the next meeting and don't forget your blank disk so that you can get the AIM disk of the month. See you there !

Nashville Atari User's Group

N.A.U.G.

Nashville Atari Users' Group P.O. Box 121752 Nashville, TN 37212

NAUG meets on the third Thursday of each month from 7PM to 10PM at the Cumberland Museum and Science Center. Membership dues are $24 per family for the entire year. With your membership you will receive our local newsletter, Atari News, a subscription to Atari Interface Magazine, access to the club's 8-bit & ST Public Domain/Shareware libraries, any group discounts on products, and entrance to all club related functions. We have an Associate Membership for $12 per year. With this membership, you will receive Atari News, AIM and access to our 8-bit & ST PD/Shareware libraries. People joining during or after the month of July pay 1/2 the yearly rate. Visitors are welcome to all meetings.

President & Editor	Walt Sullivan	(615) 228-7353
Treasurer	Michael Gardner	(615) 868-0843

O-ACEs

O-ACEs is a non-profit group interested in getting more out of Atari computers. We are NOT affiliated with Atari Corp. or any other commercial organization -- we are there for YOU! We cover BOTH 8-bit (including the 400/800, XL, XE, and XEGS series) AND 16-bit (ST series) Atari computers. We meet twice each month (except November and December) on the 2nd and LAST Wednesday each month. Doors open by 7:30 pm at La Vista Recreation Center, 8116 Parkview Blvd. (just off 84th Street, south of Food-4-Less and east of 84th at the light)

FIRST MEETING: (2nd Wednesday) Covers news, views, and decisions that ALL members might be interested in. FOCUS MEETING: (LAST Wednesday) Concentrated information on a single topic (such as word-processing, spreadsheets, music composition, desktop publishing, etc.)

Call 592-5427, for more info on O-ACEs!

Portland Atari Club and the original Eugene ACE

President	David Hunt	503-286-6276
Vice-President	Ben Smith	256-9974
Sec. Treasurer	Mel Anderson	503-232-7231
Membership Sec.	Randall Leong	246-6354
ST Disk Librarian	Teri Williams	771-7337
8-Bit Librarian	Jon Johnson	655-2092
Sargeant at Arms	Dutch Leanard	257-0481
ACE of America		503-285-4417

We of the Portland Atari Club are very excited at becoming members of AIM. PAC is one of the oldest Atari clubs and still has active sections of both 8-bit users and ST members. We currently are available through the ACE of America BBS at 503-285-4417 operating on 300/1200/2400 baud. Club meetings take place the first Monday of the month at the Northwest Service Center on NW 18th and Everett. All are welcome. Meeting time is 7 till 9:30 pm.

The Portland Atari Club wishes to announce the results of the elections for positions on the Board of Directors. 8-bit Program Dir.: Bob Beck; ST Program Dir.: Paul Karczag; Sig Coordinator: Mel Anderson; BBS Director: Chris Healy. I would like to congratulate the lucky winners, and commend those who ran unopposed for their willingness to serve. Their dedication to the Atari Community is outstanding and they have done a fine job in the past.

In addition to having our annual elections, we also held our November swap meet and there were some very good bargains to be had. There were a couple of items I didn't even know existed! We also passed a revision to our club charter which essentially removes the extra year of free membership for board members. This passed unanimously.

By the time you read this letter we will have also had a hopefully successful Christmas party and will be looking forward to that new little Atari bonus under the tree. Maybe a monitor or printer, or how about a 9600 baud modem? Like they say the real definition of a computer is a hole in the desk you throw money into...Lots of money!!

There is a BBS you may call which contains information on and about the club. ACE of America at 285-4417, 2400 baud and under. The monthly AIM disk is also available from the librarian at a reduced price. To obtain the current AIM disk at the best price you must come to our monthly meeting where you can get this fine disk for $2 plus a blank disk in exchange.

Paul Gittins, Lame Duck President, Portland Atari Club

PORTS ATARI
P.A.C.E.

8bit Librarian	Gary Armbrust	729-6906
ST Coordinator	Geoffrey Bennett	722-3354
8bit Coordinator	Aaron Potopinski	525-1058

Membership to PACE is $30.00 per year or $9.00 per quarter. General meetings are held at 6:30pm on the third Sunday of every month. In the event of a holiday, a new date will be chosen and will be posted within the pages of this newsletter and on local Bulletin Boards. Membership includes a monthly newsletter, monthly meeting, FREE Disk-of-the-Month, access to our BBS, FREE printer ribbon re-inking, and FREE copying priveleges to our VAST collection of 8/16 bit Public Domain programs. Ports A.C.E. is an alliance of families with a mutual interest in the Atari Computer and is an independent, non-profit organization. PACE hardware assets: 130XE, 1050 Drive, MacInker and a Supra 300 baud modem. Any written correspondence should be addressed directly to Ports A.C.E., Tracy Hendershot, 4835 Crosley Avenue, Duluth, MN 55804.

Happy New Year! I know everybody had a jolly Christmas because your Atari computer keeps the whole family busy during the hectic holidays. The club wants to thank all who were considerate enough to purchase software for their Ataris too. We certainly need to be active in that department and every little bit helps. Besides, it t'was Christmas! I was quite pleased to upgrade Master Tracks Pro to version 3.62. Read all of the Atari journals you can get your hands on for more interesting software that is being developed. I'm certain that the coming year will bring us many demos of all these new software packages.

We renewed our subscription for another twelve installments of AIM Disks-of-the-Month. They were everything we had hoped for. Now, those who can't afford the commercial services for the latest in Public Domain, can enjoy new software each and every month on these disks. The European software is most interesting and proves that quality PD does not necessarily originate from the United States.

There has been some discussion that an 8-bit DOM may be available from our friends at AIM. Write to Bill & Pattie, and let them know you want a monthly disk for your machine. Their mailing address is at the beginning of your AIM magazine.

Next meeting will be on Sunday Jan 20th, at the Androy Hotel, Superior WI, in the mezzanine at 6:30. See you there!

PHAST - Phoenix Area ST

The PHAST monthly meetings are held on the second Saturday of each month at 8640 N. 19th Ave., Phoenix, Arizona from 9am to 12pm.

The Prez Sez by Rick Reaser

You all should have received a complimentary copy of Current Notes a number of months ago (if you were on the mailing list when I sent it to them in August.) For those of you who haven't been to a meeting lately, let me explain. We are a registered club with Current Notes and as such, our members can receive Current Notes for $23.00/yr. I sent them a membership roster so they can verify members and they sent out a complimentary copy. Several members get Current Notes individually and the Club has a subscription which you can view/checkout at meetings. We also have a subscription to Puget Sound Atari News (PSAN). The Boston Computer Society Atari SIG also started to send us their magazine for some reason.

Speaking of newsletters, we need more of you to write up articles for AIM to keep it the high quality magazine that it is. Several of us have written articles already, and we hope to see more.

Be sure to check out LASERNET BBS (591-4620). User friendly is the buzzword on this board. The latest in Club News and happening are posted on it. There are also some great on-line games on it. I'm currently hooked on Movie Madness. If you don't have a modem, call me about borrowing the club's 300 baud Hayes "loaner modem" for the telecommunications deficient Atari owner.

The Club has been getting a lot of things in the mail lately. We pass around and discuss all the offers, sales, magazines, and other newsy items at the SIG meetings. This is a good reason to come just by itself. The Canadians have been sending us a lot of things of late. Hope to see you at a SIG meeting soon.

By the time you read this, we will have had the Club elections and the Christmas party. However, since I am writing this in mid-November, I don't know what happened, so I can report on it. Tune in next month for the complete results.

We had a good turnout at the November 8-bit SIG. John Sandgren is back, bigger than ever, with tons of tidbits for all. John demoed several fine and a few not so fine public domain financial programs. He even managed to educate a few of us (including me) in the process. We also looked at SPY VS. SPY and Kennedy Approach. Both are excellent games. We even had a "mid-air" during the meeting.

The October ST SIG was heavily attended. I am always amazed that no matter what the question is, someone in the peanut gallery will know the answer. Rick Mount, out ST Disk librarian, was back in town, buying supplies for Desert Shield from the True Value Hardware Store accross from where we hold the meetings.

Have a great new year!!!

RACC
ROCKFORD ATARI COMPUTER CLUB

WE'RE NOT JUST PLAYING GAMES ANYMORE!

Rockford Atari Computer Club is comprised of avid, dedicated users of all Atari computers. We support and promote the use of 8-BIT, and ST/MEGA machines with extensive PD libraries, monthly meetings, and semi-regular SIGS.

We have had a change of meeting place this year, as our previous site is being used for adult education on Saturdays. We may be able to secure a regular space there, if we can agree to meet at some other time/day (possibly evenings?). Any suggestions, or other alternatives should be mentioned at the meeting. Our regular business meeting is held from 9am-12:00 noon, the third Saturday of the month.

We have accepted the gracious hospitality, of the Springbrook Congregational Churches as an alternative meeting place. It is located, off Alpine, just as you make the turn onto Springbrook road, from Spring Creek road. Our mailing address is 3902 15th Avenue 1 - Rockford, IL 61108. Our phone number is [815] 397-5316.

Camille Changes Her Name! Now **"The Knights of Camelot"**

I have had a lot of trouble with my BBS since I took over Camille 2000. First I had a lot of trouble with my networking; it would dial and lock up. Sometimes it just keeps dialing and dialing. Other times it would just call and get nothing. My main problem has been some scrambled corrupt messages (VIRUS'?) coming through the network, and locking up the system, or worse trashing the hard drive!

I have been spending a lot of time trying to clean up my hard drive. It did not have anything of worth on it; only some IBM and Commodore files and the message bases. Nothing that bothered me. All I had to do was reformat the HD. About a month later another scramble occurred in the main drive, messing about 20% of the files. So I spent 14 hours arcing everything and moved it to another drive.

Then I moved it all back and unarced it. Well it lasted all of about a week and another scramble was back affecting everything again. So this time I removed very minimal stuff. Then reformated it and put what I had backed up on floppies. Well it has been running about a week and a half now without any problems. I just hope it stays up. Give us a call The Knights of Camelot *RACC BBS* (815) 226-2388. My handle on there is SysOp *Burt* or better know as King Arthur.

There is one thing I would like to say. I have been reading in AIM about people wanting them to start an 8-bit disk. I think the excuse that Bill & Pattie don't have the hardware (8-BIT) is a lame one. There are a lot of people wanting to get rid of their hardware. You could get it for a very small price. The computer clubs could donate a disk or two from their PD libraries to build a library for you. Try it, you may find it will bring some more interest to your magazine. I have some 8-bit users not wanting to get your magazine because it does not have enough 8-bit stuff in it. Well that is what I think.

Burt Luhman is 16-years-old and a Junior at East High in Rockford, IL. He is currently the Sysop of RACC BBS called "The Knights of Camelot." He is considering studying Computer Science, Repair or Programming once he graduates. The BBS is up 24 hours a day and can be reached at (815) 226-2388. 3/12/2400 Baud.

Prez Notes ver.2

I think Burt may have missed something in your comments about distributing an 8-bit disk Pattie. I know you have your hands full with publication of AIM and do not produce the ST Disks all by your little hands. [Eds. Andy, in this you're incorrect. We produce about 70 disks now each month, and each of them is copied by Pattie, by hand.] Your point being, nobody has come forward to package and distribute the 8-bit DOM, and besides all you own is ST gear anyway! (I read between the lines, "Who has time to do it on my staff, me, myself or I?!?!) Although I don't think he wants the job, why not let all the clubs contact Burt and encourage him to take up the banner!!!

I think everyone knows that, in a voluteer club like we have, once you complain about a job someone else is doing, you automatically volunteer to do that job. So, what do you say, BURT??

Rushmore Atari Computer Enthusiasts
(RACE)
3512 Lawrence Dr. Rapid City,
SD 57701 (605) 348-6331

The Rushmore Atari Computer Enthusiasts is a nonprofit organization of Atari computer owners not affiliated with Atari Corp. Meetings are held on the third Saturday of each month, 2pm, at the Westminster Presbyterian Church. Annual dues are $12 for basic membership and $15 for membership and newsletter. RACE offers the Black Hills Atari owner hardware and software support and the largest library of public domain Atari software in the state of South Dakota.

NO PIRACY WILL BE TOLERATED AT ANY RACE FUNCTION!

President	Rick Burton	(605)-642-5353
V. President	Duane Charter	

President's Particulars **The Persian Gulf Crisis Hits Race!** Effects of the gulf crisis have reached even our club. Many of our members come from the Air Force Base and some have been, shall we say, relocated. Best wishes and prayers be with them. This has left fewer members at least for the present, but...the remaining Hard core Atari Hackers (HAH) will carry on with renewed vigor!

We had field commissions, oops, I mean held elections at the October meetings. Limited attendance caused us to move to have nominations and then vote on the whole block of nominated officers. The vote was unanimous! Yes, yours truly is still the President. Duane Charter took over the Vice Presidency. Ken Kayl is the new Treasurer and Joe Weigel is the new Secretary. Congrats!

There was a lively spur-of-the-moment SIG-style rap session about IBM emulation toward the end of the meeting.

Other miscellaneous items: A raffle was decided on (8 and 16 bit) for the near future. I was contacted by a serious Atari user from Nebraska who is planning on attending some meetings. He lives three hours away but saw us in AIM and called us!

Last but not least, **Our New Meeting Location Will Be Announced.** See all you RACEdrivers at the next meeting.

R.A.C.E.

Pres/Treasurer	Eric Schofield	851-5134
Vice President	Brian Caserp	851-8092
Sec/Librarian	Tony Manino	851-8092

Hey gang! How was Christmas? I hope Santa brought everyone wonderful Atari presents to fill your holidays with cheer! Perhaps you're wondering how we're able to get our newsletter up to date in AIM? The reason is because I'm actually writing this in early November! The advantages are simple. You get the magazine and you can also find out when our next meeting is in that very issue! No more waiting around for a telephone call! The obvious disadvantages are simple, it takes a LOT more planning on the officers behalf and the information that you get is obviously dated material. Oh well, nothing in life runs completely perfect I suppose.

The presentation we held in October was an overwhelming success! We presented the Spectre GCR and we had 52 people attending! We've done the Atari community well! Don Nelson showed off the Spectre GCR while I (Eric Schofield) basically showed off Atari and the STe!

We need someone to take the role of Secretary for the club. Barry Clayton graciously accepted the original libarian position but due to lack of time, he has asked me to find someone else to take the role. If anyone is interested in helping us overworked club officers out, PLEASE give us a call. The next club meeting will be held on January 22 at 7p.m. at the Richard B. Harrison library. We will be showing off the Blitz Cable that many of you may have heard of and we will also have one other presentation yet to be announced.

If you have any questions or problems, please feel free to give any of the above officers a call! We're here for YOU! See ya at the next meeting gang!

San Diego Atari Computer Enthusiasts

General Meetings are the 3rd Monday of each month at North Park Recreation Center Social Room, 4044 Idaho Street at 7pm. ST/8-bit workshop meetings are held on the 1st Thursday of each month at North Park Adult center, 219 Howard Ave at 7pm. All meetings are open to the public. Annual membership dues are $18 which includes increased BBS access time, AIM subscription and reduced rates on the Disk of the Month. SDACE's address is PO Box 900076, San Diego, Ca 92190.

President	Richard Betson	(619)630-5869

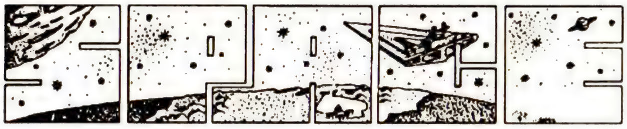
Disk Librarian	Barbara Carlstrom	371-2732

The ST Atari North Coast Enthusiasts (STANCE) is an independent, not for profit Atari computer user group and is not affiliated with Atari Corporation, or any of its affiliates, in any way.

$12 per Year with a one time sign up fee of $13.00.

STANCE club meetings are held every third Monday of each and every month at B & G Electronics, (located at 15729 Madison Ave., Lakewood, Ohio 44107) starting at 7:15PM



All meetings will be held at the Camp Hill Shopping Mall Community Room until further notice. Currently all dates are set for the 3rd Monday of the month.

ST CLUB EL PASO

The Atari ST Club of El Paso is the only official Atari ST user group in the El Paso southwest. Meetings of the ST Club are held once a month at the Richard Burges Library, 9300 Diana in the NorthPark Mall Parking lot. Each meeting is at 12:30pm on the second Saturday of each month.

Meetings feature demos of the latest ST products, as well as help for those that might have a computer problem. Voting membership in the ST Club is $20 per year, and includes a years subscription to this magazine. Newsletter only memberships are $18 per year. Members also recieve special access to the STE-EP BBS at 915-821-9220. To become a member of the ST Club of El Paso, just drop us a line to: 10953 Yogi BerraEl Paso, Texas 79934

ST Club executive committee 1990-91: Steven Bruck L.R. (Pete) Rosh Tim Holt

November 1990 Minutes-This was probably the boringest meetings ever held, BUT also the most productive meeting. We actually got the library into some order, and set a new record for most computer hardware plugged into one wall outlet: 4 STs, monitors, a hard drive, an external drive, Dave's two external drives, and a Lynx. I must say this about the library: for all the problems we have had there, they have a hell of an electrical system! Not even a flicker!

Well, we copied about 75% of all the ST library, that translates into about 83 disks full of pd stuff! No single sided stuff, Bubba, this is all Double sided, DD, and crammed to the gills with pd stuff from our former librarian's library. We still have a hell of a lot of cataloging to do, so anyone interested in helping Dave, give him a buzz.

Here is the scoop: When the library is in order, YOU will be able to access all the disks, or just one disk, simply by leaving a number and a file name on STE-EP. (Of course, you must be a club member for this benefit to occur.) Also, the entire library will be at every meeting, for you to copy your little brains out.

December will see the Lynx Giveaway, a vote on a club name: ACCEPT, the auction, and maybe, we will have the library ready. Keep your fingers crossed. Welcome back Mark and Dave Davis for another year. Also, thanks to all who have sold tickets. I know of several of you have bought whole packets: C. Klassen, G. Schleuter, T. Hodgeson, T. Holt, D. Davis, M. Davis, and S. Bruck.

We need the following demos in the future, so if anyone out there would like to volunteer, please let me know: Multisynch monitors, Non-Atari Laser printing, constructing a hard drive, computer electrical safety, databases, spreadsheets, the Portfolio and the ST: Is it a match? If anyone could do ANY of these, please drop me a line, so that I may schedule you for a month. Until next month!

STUN

The ST Users Network -- supporting users of the Atari ST, Mega, and newer technology computers. P.O. Box 27285 Salt Lake City, Ut. 84118. STUN operates a 24 hour BBS -- (801)272-4243. Open meetings are held on the 3rd Wednesday of each month at 7 P.M. in the Murray High School.

STUN's last meeting was all about disk storage. Randy explained some of the special data on track zero of each disk that tells the operating system how the disk is formatted. For special applications a disk can be prepared with more than the standard free space through custom formats.

The November meeting will feature demonstrations of NeoDesk 3.0 and a new hardware item that allows direct use of Macintosh peripherals on the ST. DreamPark Development is the manufacturer (the ones who make the PowerDrive high density drives).

ST☆R
ST ATLANTA ROUNDTABLE

STAR (ST Atlanta Roundtable) meets at Shoney's at 6551 Peachtree Industrial Boulevard at 7p.m on the Third Monday of each month. Membership dues are $15 per year. Each member will receive a copy of AIM and a new PD Disk is available each month. For membership info contact Ed Cadow, Claude Brewer Rd, Loganville, GA 30249 or (404) 466-0014.

President	Bruce Hein	(404) 926-0095

Newsletter Ed.	Jim Menegos	(404) 473-9885

ST.A.R.R. ST Atari Road Runners

THE #1 ATARI USER GROUP IN THE NEW HAVEN (CT) AREA

ST Atari RoadRunners is probably now the oldest continually running Atari user group in the state of Connecticut. The club was organized in March 1986 by one of the New Haven area Atari dealers and at that time we were strictly an ST club. As time went on, other Atari groups started to disband and we found ourselves in and among the 8-bit users.

We hold our meetings at Greater New Haven State Technical College, in North Haven, CT. Our meetings have traditionally been held on the first and third Thursday of each month. However, starting in January 1991, we will hold only one meeting per month and that will be on the third Thursday. The first meeting of the new year will be January 17th at 7PM. Hopefully, we will be in Room 307.

If you would like more information about ST.A.R.R., feel free to contact one of our officers listed below. And, do call the ST.A.R.R. BBS -- our sysop gets lonely sometimes.

Matthew Masserman	President	(203) 621-7007

Merrill Ross	VPfor 8-Bit Affairs	(203) 239-9403
ST.A.R.R. BBS (300 - 9600 baud)		(203) 421-486

We would like to take this opportunity to wish all of our fellow Atarians a very Happy Holiday Season and of course the best of New Years.

SWAG
Southwest Washington Atari Group

The Southwest Washington Atari Group was formally created in April, 1985; prior to that, local Atari enthusiasts met on an irregular basis. The group has been holding its meetings at 6:30 p.m. on the last Sunday of the month (save July) at Clark County Fire District #5, Station 3 on 213 NE 120th, Vancouver, WA. SWAG started out with a large following of 8bit owners and as more and more members upgraded to the Atari ST, the membership has become mainly ST owners, but 8bit is still supported. Annual dues are $12 and SWAG can be contacted at PO Box 1515, Vancouver, WA 98668.

Minutes for October 1990, S.W.A.G.

The meeting was opened by president, Allan Coker, at 6:30 p.m.

The meeting was held at our normal meeting place, Fire District #5's meeting hall. Eighteen members were in attendance. Our membership is increasing. Michael Bigham of Gresham, Oregon joined the ranks, bringing our total paid memberships to 31.

Member J. Gerber (president of STep) reported that Steve Braun (Braun's Computers) is seriously considering selling his computer business in Beaverton, Oregon.

Micheal Calvin donated a package of Micro/5 ComPak "Color Coder" 3 1/2" disk storage boxes to be raffled off. Member Tom Antolic held the winning ticket.

Gary Lentz demonstrated two programs: "LOOKIT & POPIT" from CodeHead Software and "MUG SHOT" for Wiz Works.

Salinas Valley Atari Computer Enthusiasts

SVACE is the only Atari user group in the Monterey Peninsula area. It supports both the 8-bit and ST computers. There is a free disk of the month for all attendants, bring your own disk. Dues are $12.00 per year and includes Atari Interface Magazine. Meetings are at 7:30 P.M. on the first Tuesday of the month at the Salinas Community Center. Demonstrations and raffles are a regular part of our meetings. SVACE can be contacted at 672 E. Romie Lane, Salinas, CA 93901. Anybody interested in Atari computers is welcome.

We have had interesting meetings lately. By combining hardware from different users, we were able to scan things and print them on a deskjet. We had another meeting and again by combining equipment we connected two ST's together with a null modem. We then had demos of games that can be played by modem and a telecommunications demonstration.

The next meeting (which may have happened already) will be on MIDI. We expect to have two keyboards a number of MIDI programs and a demonstration of Sierra-on-Line's use of MIDI sounds in their games.

TACE

Tinker Ace of Oklahoma

Tinker ACE of Oklahoma meets the first Saturday of each month at 1 PM (12:30 set-up time) in the Moore Public Library, 225 S. Howard, just off of SW 4th and I-35 in Moore. TACE can be contacted at 104 E. Northrup, Midwest City, OK 73110 or at the TACE BBS (405) 755-9561, 24 hrs., 3/12/2400 baud, running Oasis 4.3 software with over 60megs online storage. ST & 8bit support. Dues: Full - $20, Correspondence - $15. Dues are prorated at $1.25/month for correspondence membership and $1.66/month for full membership.

TEAC
The Educator's Atari Club

Yearly membership fee of $25 includes 6 issues of the TEAC newsletter, the TEAC Educational 8-bit Disk Library catalog and a one year subscription to Atari Interface Magazine. For more information, contact TEAC at PO Box 1024, Laytonville, CA 95454.

UNYACE
Upper NY Atari Computer Enthusiasts

The Upstate New York Atari Computer Enthusiasts (U.N.Y.A.C.E.) meet monthly at the New York State Electric and Gas building, on Old Vestal Road in Vestal, New York. Meetings are from 7 to 9 PM in the Auditorium. The next meeting date is March 12th.

U.N.Y.A.C.E. had optional dues of $8 per year. Monthly meetings are informal and open to all who are interested in Atari computers.

Contact C. Todd Krissel, President, at (607) 729-4303 or call the Cygnus BBS at (607) 729-5506 (9600 baud, 24 hrs/day) for more information.

RAM

Ventura-RAM, a charter member of ACE-NET, meets the third Wednesday of the month at the Mercury Savings Bank at 1656 Arneill Rd, Camarillo at 7:30p.m. in the Mercury Room. Membership dues are $24 for a full year, pro-rated monthly. Renewals are only $20 a year. Newsletter membership only is $15 a year, pro-rated. For more information on Ventura-RAM, contact PO Box 1513, Camarillo, CA 93011.

WAUG!

The Washtenaw Atari Users Group meetings are held every second Tuesday of the month at 7:30 pm in the Michigan Union building on the campus of the University of Michigan on State St. at the corner of S. University in Ann Arbor.

Club dues are $15 per year and provide access to the PD library and subscription to AIM. Meetings feature demos of both 8bit and ST software and hardware.

WACO
WESTMORELAND ATARI COMPUTER ORGANIZATION

Westmoreland Atari Computer Organization meets the second Tuesday of each month in the North Huntingdon Township Town House, Center Highway and Brownstown Road (just off Route 30 near the Hamilton car dealerships, Irwin, PA) at 7:30 P.M.

Founded in December, 1983, WACO boasts huge ST and 8bit PD libraries. Double-sided disks are only $3 for members, $4 for non-members. Disk catalogs on disk are only $2. The $20 annual membership ($24 for family) now includes a subscription to AIM.

WNY UG

WNYAUG meets at 7:30 pm on the first Thursday of each month in room 116E, Bacon Hall at the State University College of Buffalo Campus, 1300 Elmwood Ave.

Dues are $15 for new members and $12 for renewing members. Send checks and correspondance to WNYAUG, PO Box 59, Buffalo, NY 14216.

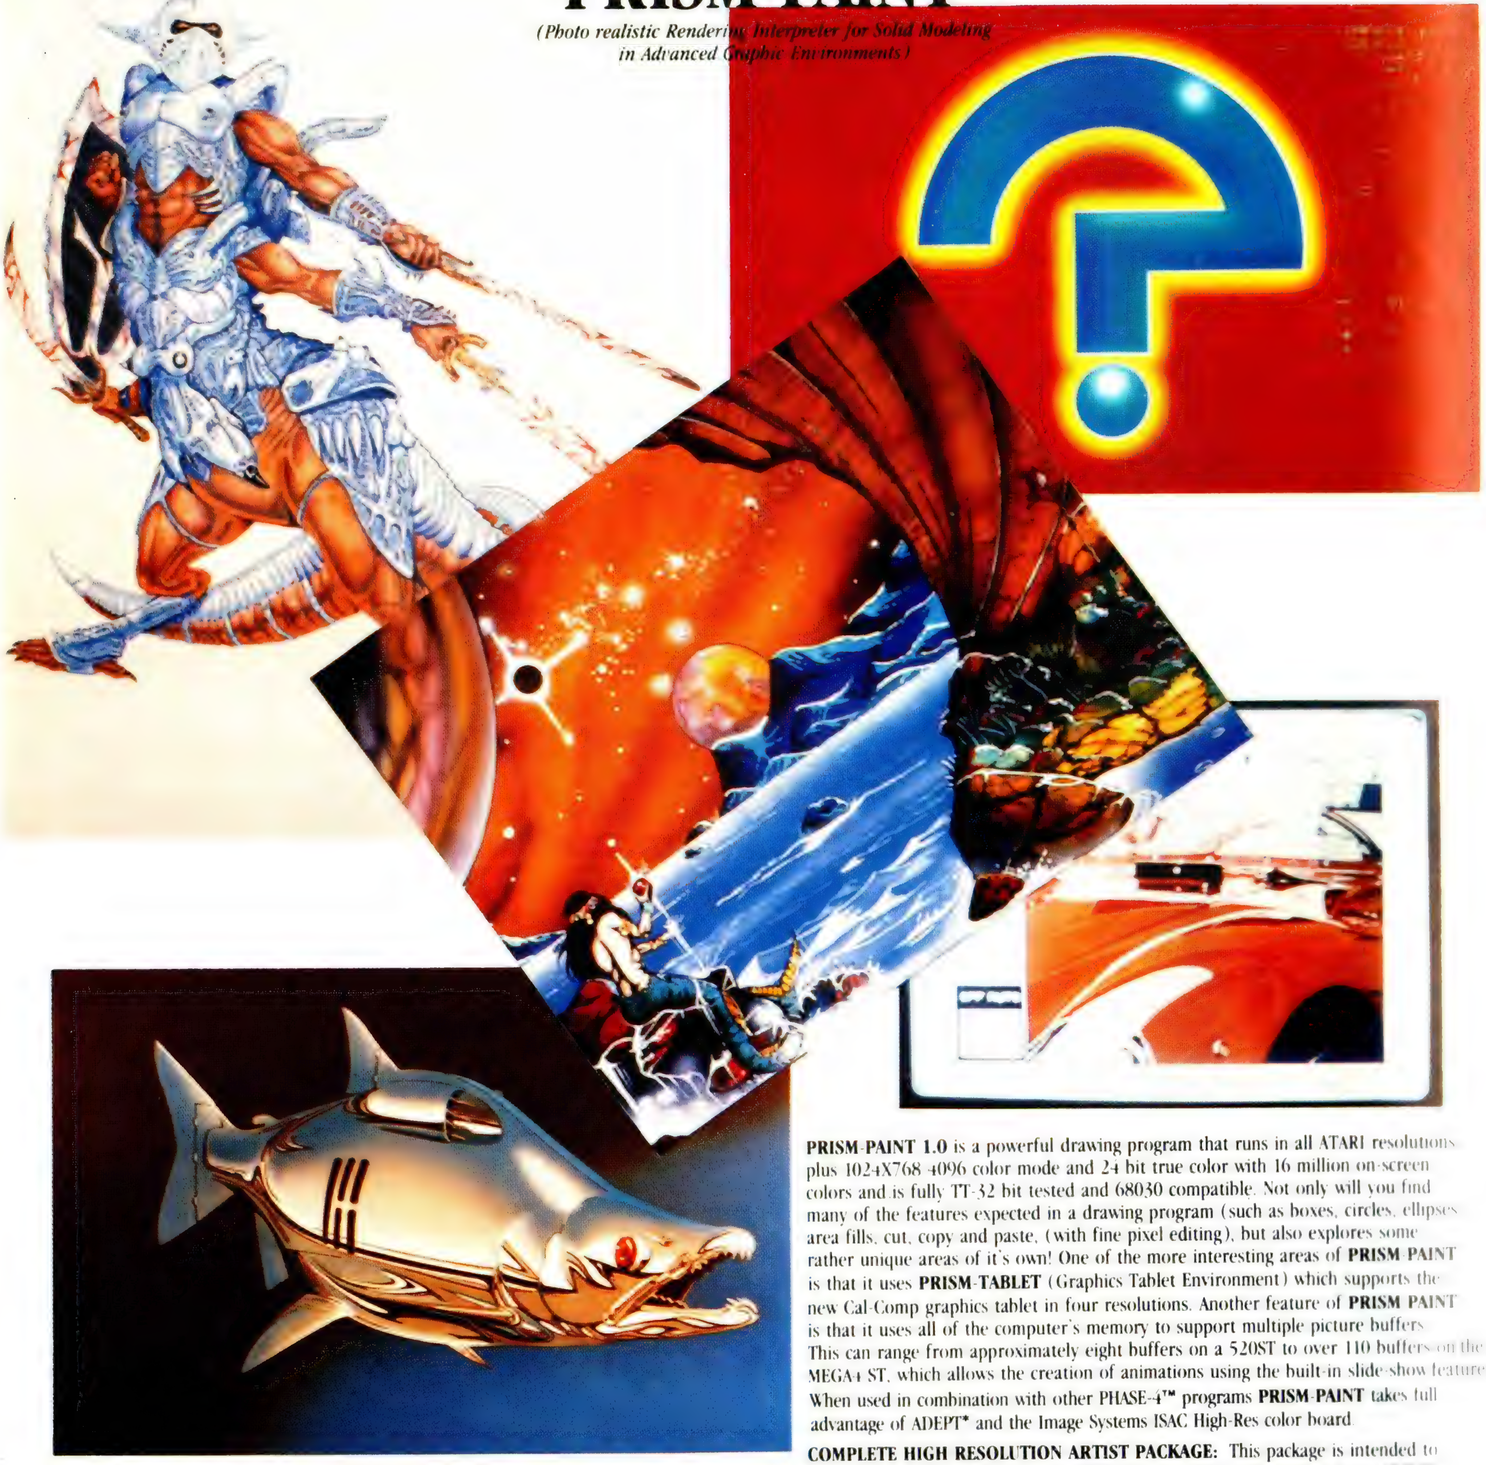
DISCOVER THE 4TH DIMENSION

Explore computer imaging and animation in time and space.

PRISM-PAINT

(Photo realistic Rendering Interpreter for Solid Modeling in Advanced Graphic Environments)



PRISM-PAINT 1.0 is a powerful drawing program that runs in all ATARI resolutions plus 1024X768 4096 color mode and 24 bit true color with 16 million on-screen colors and is fully TT-32 bit tested and 68030 compatible. Not only will you find many of the features expected in a drawing program (such as boxes, circles, ellipses area fills, cut, copy and paste, (with fine pixel editing), but also explores some rather unique areas of it's own! One of the more interesting areas of **PRISM-PAINT** is that it uses **PRISM-TABLET** (Graphics Tablet Environment) which supports the new Cal-Comp graphics tablet in four resolutions. Another feature of **PRISM PAINT** is that it uses all of the computer's memory to support multiple picture buffers. This can range from approximately eight buffers on a 520ST to over 110 buffers on the MEGA4 ST, which allows the creation of animations using the built-in slide-show features. When used in combination with other PHASE-4™ programs **PRISM-PAINT** takes full advantage of ADEPT* and the Image Systems ISAC High-Res color board.

COMPLETE HIGH RESOLUTION ARTIST PACKAGE: This package is intended to upgrade any MEGA ST computer to full color graphics workstation status. ARTIST PACKAGE Release 1.0 features 4096 color palette support with/24 bit 16 million colors available in the professional package. When used with Syquest 44 HD system the artist can create real time animations up to 55 minutes long in all supported color platforms/with full 64 channel midi movie sound track support.

Out with the old…

…In with the new.

The **old way** of combining text, graphics, and live data on a single page: use a word processor, database, spreadsheet and page layout program. The **new way**: just use ***Wordflair* II**, the integrated document processor. If you currently own 1st Word Plus (GST); Word-Up (Neocept); Word Writer ST (Time Works) or Microsoft Write, we invite you to ring in the New Year by making the switch to ***Wordflair* II**. Simply complete the form below and send us your original program disk(s) along with a check or money order for $75 US. That's half off the list price of $149.95. We'll send you ***Wordflair* II**. But hurry, this offer ends February 15, 1991.

Wordflair II™

- Fast word processing.
- Fully integrated financial calculator.
- Quick and easy page layout.
- Free form database, imports/exports tab or comma delimited ASCII data.
- Spell checker & thesaurus.
- Creates tables and graphs.
- Imports graphics: IMG; GEM NEO; DEGAS, Mac Paint Spectrum; Tiny, etc.

Send completed forms to:

Goldleaf Publishing, Inc.
700 Larkspur Landing Circle
Suite 199
Larkspur, CA 94939
Att.: Wordflair II Swap Offer

Questions? Call our "Swap line" at (415) 461-5703. from 9am to 4pm PST.

☐ Yes, I'm ready to make the switch. I am enclosing my _______________disk(s) along with a check for $75 US.
(Please allow 4 weeks for delivery)

☐ Send me a data sheet first, then I'll decide.

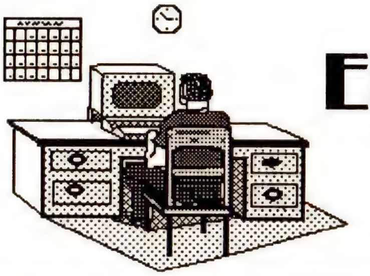
On the Cover

Gribnif's NeoDesk 3, a major upgrade to an already great product.

Managing Editor: Patricia Snyder-Rayl
Editor: Bill Rayl
Artwork: Migraph, Steve Volker, S. Kendrick

AIM is produced on an Atari Mega STe 4, HP Laserjet II with PacificPage Postscript cartridge, PageStream and Calamus.



EDITORIAL RAMBLINGS

We'd like to thank all the people who shared with us their thoughts on how we can improve the magazine to better suit their needs. The majority of votes we got were to keep the cost and mailing procedures the same and continue to expand and improve the publication itself.

Coming in second was moving to second class mail to get the magazine to our readers in a more timely fashion. Part of the delays for the last few issues have been either at our end or with our printer, not totally because of the mail. Although on the East and West Coast, the mail does seem to move slower than other parts of the country. Moving to second class means more cost and paperwork on our part, and, at least in Michigan, no increase in delivery speed. We can increase the timeliness by working harder on our end.

Also, we got quite a bit of positive feedback on starting up an 8bit Disk of the Month. We'll be doing this with the next issue! For those interested in subscribing to such a disk, the cost is $50, the same as the ST Disk. Participating clubs should contact us for their special rate. Right now, we're planning on making this a "flippy" disk formatted at single density.

Be on the lookout for our new PC and Spectre disks as well! Soon we'll have a library of public domain software to work with your PC emulator and your MAC emulator!

AIM has gone international! With the addition of the Windsor Atari User Group out of Ontario, Canada, AIM is now serving clubs outside the US. Not to mention being distributed across the globe soon! That should happen with either this issue or March's issue.

At the beginning of January, we traveled to the 3rd Annual 16Bit Computer Faire in London, England to introduce AIM to European Atarians. We'll have photos of this Atari/Amiga show next month!

HIGH DENSITY DRIVES for the ATARI ST

POWERDRIVE™

Put 1.44 Megabyte Storage in your ST!

The PowerDrive modification board allows you to use standard high density drives that automatically down-grade to standard ST format. Comes with formatting software to format up to 1.7 megs.

Board and External HD Drive...	$259.95
Board and Internal HD Drive...	189.95
Modification Board only...	119.95

CARTOGRAPHER

The Editor for Chaos Strkes Back™ and Dungeon Master™ Saved Games

With our easy to use, mouse-based program, you can display the maps contained in your saved games, and then alter them at will. Remove walls, pits and any other obstacles that you need removed. You can even remove the locks on doors. Only **$19.95**

From The Reader's Viewpoint

Dear Editor

After having owned the Word-Up word processor from NeoCept, for the past two years, I wanted to alert you and the Atari-using public to beware of this unbelievably shady and fly-by-night operation.

What basically has happened is the company has left me stranded without a prayer. I purchased the last two updates, which were riddled with problems too numerous to mention. After getting nowhere with the rude people in customer support, I decided to use the product the best way that I could, despite the features that I originally purchased the product for in the first place never did work (and to this day still don't!).

Well, I figured that's the way it goes...you win some; you lose some. Until, that is, in March of this year when I applied for the Version 3.0 update. Can you believe that when I received the upgrade in August (a little late), the disks I got back were blank! So, I sent them back.

A month later, they came back, still blank! So I sent them back again, with a letter asking what the heck was going on (I couldn't reach them by phone, no one seems to ever be there....), and ten days ago, I received the disks back, again, all blank and one of them destroyed!

Is this the way companies you invest a considerable amount of money in should treat their customers?

Not to mention that I have two years of work files in the WordUp format, so switching now would be catastrophic! I still can't reach them by phone or mail. What the heck is going on here, anyway?

I also think everyone should know that Mike Fulton, president of NeoCept, has gone to work for Atari Corporation, and he has dumped WordUp, his customer support and basically his integrity and business ethics. (No one is supposed to know this information, but I figure, what the hell, it's from a reliable source, and I'm sick and tired of the treatment I've gotten from NeoCept.)

So, if you have any word on this situation, please let me and others know, as I feel like I've really been ripped off from these pompous guys. The program crashes and cursor-chatters like you wouldn't believe. (It took me forever to write this letter on it!) And anyone thinking about buying WordUp—Don't Do it! You'll really be sorry you did.

Thanks for listening,
John-Paul
1905 E. First Apt. D
Long Beach, CA 90802-6126

[Eds: John, we're sorry to hear you're having such problems with NeoCept and WordUp. We contacted Mike Fulton at Atari. He promised to contact Shelby Moore, who is the president of NeoCept, not Mike as you stated. Unfortunatly, Shelby has not contacted us to explain what is happening currently with NeoCept.

Recently, patches to WordUp have been uploaded to GEnie, but there has been no official statement. There've been many comments from WordUp users talking about difficulties with the software and delays in getting upgrades.

You may wish to take Word-Flair up on their 1/2 off offer on their fine document processor! See the ad on page 1 for more details.]

SQ44-ST Removable Cartridge Hard Drives

Starting at $779 Complete!

All SQ44 systems come ready to run on the Atari ST with 1- SyQuest SQ555 Removable Cartridge Drive, 2 Year Warranty on drive - 20Ms access 600K/Sec, 1 SQ400 cartridge filled with 44Megs of PD software, fully wired for 2 SCSI drives, SCSI/DMA host with formatting software, cable, DMA in & out ports, fan, and *FREE SHIPPING* to 48 states.

ATARI BULLETIN BOARD

by Bill & Pattie Rayl

Atari News

The TT has gained FCC Class A certification. Atari can now sell the new 68030-based 32MHz machine to business customers here in the US. Atari has reportedly shipped a number of TTs to VARs here in the US, and the retail price is around $3000 US. UNIX for the TT is expected to be shown at the Hannover show later this year, with US availability by the third quarter of 1991.

Jerry Pournelle, author of Byte magazine's *Chaos Manor* column, has been sent a TT for review/ evaluation purposes. In the past, Pournelle had given some very good publicity for the ST computers in Byte.

The Mega STe has also reportedly passed FCC certification, as a Class B machine. This allows Atari to sell the computer to the general public. Along with the new SC1435 color monitor with stereo sound, this machine is (in our opinion) the best machine for the general user that Atari has ever produced.

In fact, this text is being typed in on a new Mega STe 4 right now. The CPU comes with two 9-pin serial ports, VME bus, LAN port, stereo output jacks, Blitter, detachable keyboard and internal hard drive. The keyboard is, by far, the best we've ever typed on for *any* computer.

The machine can be switched (via the Extensible Control Panel) to 16 MHz with or without cache and 8 MHz without cache for compatibility with timing sensitive ST software. The Mega STe also comes with the "NewDesk" built in. This is the same enhanced desktop as found on the TT, and it is a major improvement.

The Mega STe should already be available by the time you read this (really!), with a suggested retail of $1795 for 4megs with 50meg hard drive. We will have a more detailed article on the Mega STe in next month's issue of AIM!

At the winter CES in January, Atari offered use of a Portfolio to the first 100 editors responding in advance to their offer. The editors picked up their Portfolio the day before or the first day of the show, and Atari reps showed them the features and capabilities of the palmtop.

The editors returned the Portfolios by noon of the last day of the show, where all articles and such entered by the editors were transferred to disk, printed out or uploaded directly to the editor's staff headquarters.

Atari has also made arrangements with the USO and Defense Logistics Agency to supply Lynx game kiosks for use in military recreational centers in Saudi Arabia. "...We thought the Lynx systems and game cartridges would help improve morale and would provide the men and wome stationed there with a little entertainment," said Meade Ames-Kline, president of the consumer products game division.

The initial shipment of Lynx game kiosks is valued at $50,000. Additional shipments are possible, depending on how long U.S. military personnel are stationed in the Middle East and how well the currently shipped machines are received.

Rumor of the Year for 1990

Recently, users saw the coming and going of Elie Kenan as possible head of what would become Atari North America. Kenan was seen as "Atari's Last Best Chance" to revitalize the US market. His leaving caused some developers and users to serious doubt Atari's survival chances.

As 1990 drew to a close, a rumor from Germany indicated that Alwin Stumpf would be stepping in to take over head of Atari North America. Stumpf, Director of Atari GmbH, is a long-time Atari employee on a par with Kenan. According to a Dec. 20th report in the Frankfurt newspaper FAZ, Stumpf will soon be moving to Toronto to become head of Atari North America.

Developer News

Gadgets by Small announced specifications and pricing on their anxiously awaited 68030 upgrade for ST owners. Called the 68030 SST, the upgrade board has sockets for a 68030, math coprocessor and up to eight SIMM modules for up to 12megs memory on a Mega4.

The board also has a 32-bit 33 MHz expansion port for future add-on cards. The basic board (no 030 and no SIMMs onboard) costs only $599. You would need to buy your own 68030 to use the board.

For $799 (Option A), you can get the board with 16 MHz 030 and no additional memory. Option B gives you everything in Option A, plus 4 megs of onboard RAM for $1059.

Option C (or as Dave Small calls it, the "rock-and-roll option") gives you a 32 MHz 030, 68882 coprocessor and 4megs of onboard

RAM for $1399. Currently, the SST is designed for Mega ST owners only, but Gadgets is working on an upgrade for 520ST and 1040ST owners.

Contact Gadgets by Small, 40 W. Littleton Blvd. #210-211, Littleton, CO 80120, (303) 791-6098 8:30-2:30 Mountain on MWF, FAX: (303) 791-0253.

SofTrek has released version 1.84 of their popular TurboST software accelerator. TurboST will now run on STs equipped with 68010, 020 or 030 CPUs. The software is much faster at displaying non-byte aligned text in color and mono modes and the AUTO folder versions use less memory.

Special coding to speed up Word Perfect and Dyna Cadd are also included in this release. Owners of version 1.8 or 1.82 can upgrade free of charge by sending in their disk. Owners of older versions should send in their disks with $5. Contact SofTrek, PO Box 5257, Winter Park, FL 32793, (407) 657-4611.

Artisan Software has announced availability of TransporT, a nice utility for transferring text and executable files between the Atari ST and Portfolio. Two levels of menus give you lots of options and the online help is excellent. TransporT retails for $24.95.

Artisan also has their new edition of the Revolution Handbook. This paperback edition is designed to assist first-time computer buyers in the purchase of a computer, along with the features that made the disk-based Handbook popular. Retail is $14.95 plus $1.50 s/h, and $1 from each book sold will be contributed to Atari for the purchase of Atari computers for schools. Artisan Software, PO Box 849, Manteca, CA 95336, (209) 239-1552.

Practical Solutions recently announced release of Safekey, a programmable hardware copy-protection "dongle" that connects to the ST's RS232 port. Originally designed for Lexicor Software's new products, PS is now offering this product to other software developers, first on the ST and later on the Mac and NeXT.

Depending on the model, prices for the device are between $29 and $49 each. For more info on obtaining a Developer's Kit, contact Practical Solutions, 1135 N. Jones Blvd., Tucson, AZ 85716, (602) 322-6100.

Wordflair II is available from Goldleaf Publishing. The new version includes a spell checker and thesaurus, enhanced database facility, improved interface and faster handling of graphics. Wordflair II has a suggested retail of $149.95 and upgrades from previous versions are $50.

Users of 1ST Word Plus, Microsoft Write, WordUp or Word Writer ST can purchase Wordflair II for only $75 until February 15. Send in the original disks for your current word processor with the check or money order. (Wordflair requires at least one meg of memory.) Goldleaf Publishing, 700 Larkspur Landing Circle, Suite 199, Larkspur, CA 94939, (415) 381-7717.

Show Information

Bob Brodie, Atari's User Group Manager, is working on his 1991 schedule for user group visits and shows. He requests that any user groups planning a show in 1991 should contact his *ASAP* to get on the calendar.

Your event should be scheduled at least 30 days from any other event. If in the same geographic region (such as the West Coast or Midwest), your event should be scheduled at least 90 days from any other. By following these rules, Atari will be able to better support all shows.

Currently, scheduled user group sponsored shows include the Windsor/Detroit International AtariFest on May 4-5, Glendale Atari Faire in September and WAACE AtariFest on Oct. 12-13. Bob Brodie says he's heard "rumblings of shows" in Vancouver, Chicago, Erie PA and Boston for 1991.

Call Bob Brodie at (408) 745-2052 to get on the calendar and to find out if your planned dates conflict before your club is firmly committed.

Bill Pike (PAC)

Review copy loaned by IB Computers of Beaverton, OR.

A lot of people have been waiting for this one. The people at Gribnif Software, in their competition with Double Click, have put everything including the kitchen, bathroom and laundry sink into this program.

I think they added a few other things just for good measure. They should have named the program "Everything You Always Wanted to Do from a Desktop and More."

Using NeoDesk

People with just a floppy drive and 512K are able to use this program without a problem; however, keeping up with the disk swapping can be a real pain. With less than 2 megs of memory, you will need to use the option that unloads NeoDesk from memory when you run a program. This requires you to reload the main part of the program from disk each time you wish to return to the desktop. This isn't a great problem for those with a hard drive or second floppy drive.

People with 2-4 megs can leave the full program resident, unless using a program that really sucks up the memory.

The equipment I am using consists of a 1 meg 520ST with switchable TOS 1.0 and 1.4 (yes, I hacked it), an ICD hard drive and boot software version 4.84, both monochrome and color monitors, standalone printer spooler and an Epson FX-80 Printer.

This is the basic NeoDesktop, showing five open windows. Note that each window can have a different display regarding icons and font sizes. Also note the icons on the desktop at the bottom of the screen. By clicking on these icons (all from different paths) you can run the programs.

I also have a number of ACCessory and AUTO programs installed together in various combinations. I guess what I am trying to tell you is that NeoDesk works fine with all of them in *a lot* of combinations. This is one well-behaved program.

Near-Perfect NeoDesk

The only glaring fault I can find is with the manual. The "Index" for the 128-page manual consists of two pages. Come on now, don't tell me you can only find two pages of stuff someone would want to find quickly!

You can look at the table of contents in the front, but trying to find what you want in those eight pages can be a real pain.

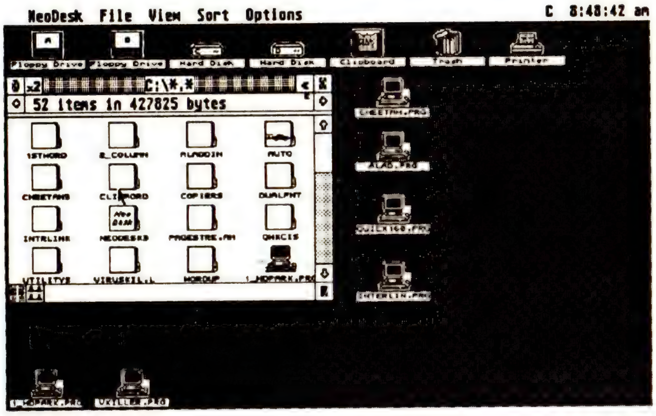
OK, enough of the preliminaries. Let's get down to what NeoDesk 3 will and won't do: There is a Clipboard, which is actually a variable size RAMdisk used to hold a file in the computer's memory while you switch disks. Files can be moved between the Clipboard and any disk at will (if you took the write protect off the disk to begin with).

You can leave a note to yourself on the desktop. Maybe the last time you called a BBS or to remind you of an anniversary or when your taxes need to be done by.

NeoDesk and Icons

Icons for commonly used programs can be placed on the desktop and the names changed to reflect the program names rather than the filenames. The programs can be run from the desktop.

A custom icon, even differently colored, can be assigned individually to any file or folder. This works well for low and medium resolution, but the colors don't



Icons/files can be dragged onto the desktop and they will stay there even if you close the directory window from which they were dragged. You are able to click on the icon and run that program. Please note the 'C' in next to the clock display. That tells you the "Caps Lock" is on. The 'C' disappears when Caps Lock is off.

come across very will in high res (Ha, Ha). You can use an existing icon or construct your own. An icon editor comes with the program, allowing you to modify existing icons or design totally new ones if you don't quite like anything provided on the main disk or the extras disk.

Directory windows can be split so one shows the upper half of the window—or a folder's contents in that window—while the other window shows a totally different area of the directory. The windows scroll independently.

A button on each window lets you "select all" files in the window, even those not shown onscreen, for multi-file operations.

You can independently set the display type (show as icons, small text or large text), location, size and sort options for any of the seven—yes, that is seven—windows available. However, if you have seven windows open and you call an application that uses a window, making a total of eight open windows, just count the bombs on the screen and re-boot.

There is an accessory that gives your system a recoverable trashcan. This puts the deleted files into a hidden area and you can recover the files at a later time or junk them totally. Using this option will make you hit the dreaded "disk full" error if you don't empty the trashcan from time to time.

A full Control Panel accessory is included that lets you set just about everything except when the wife or kids will interrupt you.

The *smart* file copier is one of the nicest features of this program. No more multi-disk swapping. It uses the free memory of the computer to load all the files it can, then writes them out in "one swell foop."

You can also create/assign a macro (a series of operations on the desktop) to a unique key. Then, the computer will repeat these operations for you each time you press the key combination. This can be used for opening windows, copying/deleting files, executing programs, et cetera.

If you drag a single file or group of data files to an icon of a program on the desktop, the program will be run using that/those files as parameters.

There is a system search feature that allows you to find that missing file...you know, the one you saved in a hurry but don't remember just where you saved it.

You can print a complete directory listing of any window and you can optionally include the contents of folders as part of the printout.

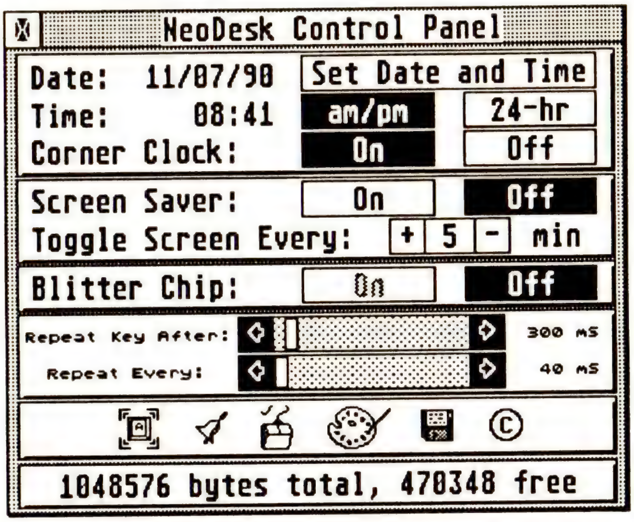
You can even set a window to display only those files with a particular extender. Now where did all those .DOC files go?

The Disk Copier is another real goody. It detects the format of the source disk and then formats the destination disk to match. You can even copy identical hard drive partitions to each other.

This is another good one. The Disk Formatter will format in 80, 81 or 82 tracks and 9 or 10 sectors/track in twisted or non-twisted format. Here is the good part: NeoDesk starts formatting from the inside of the disk and works its way out, so the directories and FAT say "bye bye" last. If you accidentally start to format a valuable disk, you might be able to break out of the format and recover your data. I, however, would never uses this feature. (HA HA!)

You are able to view files in a window without them being sorted. In other words, the files are listed in the order in which they were written to the disk. This is very nice for reorganizing programs in the AUTO folder. Just move the files back and forth between the clipboard and the disk to get the order you want.

A Degas or NeoChrome picture can be put on the desktop so you have something to look at other than a green screen (or whatever color you tell NeoDesk to set). No, the program doesn't have a check for an



NeoDesk Control Panel

Date: 11/07/90

Prices also reflect various cabinet/power supply configurations (over 60 configurations are available) All Units: Average Access Time: 24ms to 34m. Larger units are available (special order only). All units compatible with Spectre GCR, AT/PC Speed and SuperCharger.

We Have a Complete Line of 3.5 Low Profile Hard Drives for Use in Megas and related configurations.
Quantity & User Group Discounts Available!

Removable Media Devices (44mb) Syquest 555

- Syquest 44MB Removable media drive
- ICD ST Advantage Host Adapter
- ICD Utility Software
- 3' DMA cable
- Fan and Clock
- Multiunit Power Supply
- 44MB Sysquest Cartridge
- Completely assembled and ready to run!

Only $719

Order your Custom Syquest Unit Now and get a **Second Unit for $50 less!**

Syquest Removable Media and Hard Drive Combinations

Systems below come with a Syquest 44MB drive

30MB SQG38	$1019	50MB SQG51	$1039
65MB SQG09	$1109	85MB SQG96	$1119

- Lowboy - Standard - Dual Blower Cabinets, Custom Walnut WOODEN Cabinets, Tower - AT - XT Cabinets
- All Power Supplies UL Approved
- 12 month FULL Guarantee
- Larger Units available Special Order Only
- Dealers and Distributors wanted! Personal checks accepted.

NeoDesk allows you to define which files are displayed in a given directory window.

X-Rated picture, so if you (or your kid) put one there and your wife sees it..., enough said.

Finally *all* desktop commands have "Hot Key" combinations.

Like I said in the beginning, the people at Gribnif put everything in this program. A few of the features I use all the time, some of the features I use some of the time, many I hardly ever use, and a lot I probably never will use. However, it is much better to have something there and never use it than to need something and not have it available.

The only problems I can find with NeoDesk 3 are the price—$69.95—and the manual, specifically the index and a few other things. The cost for NeoDesk is about $20-$30 higher than DC Desktop.

Meanwhile, back to the manual. Many times the manual will reference a different section while talking about a particular feature. If the writer could have given page numbers to go to, it would have made it much easier to understand what they were talking about.

The organization of the documentation also leaves a few things to be desired. When I started reading the book (Yes, I always read the manual before I mess around with the program, don't you?), I was jumping all over the place trying to find out just what they were talking about. This and the lack of a usable index were the only things that put me off from the program.

The program itself is very well done and highly useful, even for those with a minimal system. (Remember all the disk swaps when you had to copy files with one disk drive?) For those with a full-blown system, "Oh Boy! It's Party Time!" All screen resolutions are supported and everything you learned using the original Atari desktop passes over to NeoDesk 3.

With so many features available at once, I felt like Alice at the Mad Hatter's Tea Party for awhile, but that passed. If you are looking for a *much more powerful desktop,* you should consider NeoDesk 3. The price is a bit high, but the program is well worth it. The folks at Gribnif Software have a winner here.

Deluxe Paint ST

Steve Kendrick

Copyright (c) 1990 S. Kendrick

Bif Bitmap has been your friend for quite awhile, but sometimes he can be, well, such a.... Like the time when you both decided to buy home computers. You became the proud owner of a 520ST, while he opted for one of those others—the one with the friendly Spanish name and all the pretty colors.

You knew you made a good choice, but Bif just couldn't pass up any chance to one-up you at every turn. "Well, *my* computer has great stereo sound." As soon as one is available, you install a Tweety Board. "Well, *my* computer accepts a BridgeBoard that lets me emulate IBM compatibles." Finally you can sleep at night knowing your shiny, new Supercharger and Spectre GCR even that score, with style.

Still, Bif never relents. He always manages to counter every addition to your proud Atari system that makes it just as capable as his machine, never mind the great applications like Calamus and LDW Power that leave his machine in the dust.

Finally, when you come home with an STe, with its built-in stereo sound and 4,096 color palette, you get a miserly concession: "I guess the ST has evolved into a system I might consider. But, for all the enhancements it has, it will never get the type of software that will make use of the hardware! I bet you can't even show me a decent paint program like Deluxe Paint III that I have on my system!"

At Long Last!

You chuckle to yourself, a moment of triumph! You pull out the bag that hides your brand-new copy of Deluxe Paint ST, pop the shrink-wrap, and boot your system. You read the catchy blurb on the back of the box, and rely on the Dpaint name to provide the quality and features you need: extended STe palette support, file-compatibility with other computer hardware, a horde of drawing and animation tools.

A quick glance at the reference card and you are easily making Bezier curves and fancy gradient fills. You think to yourself, "looking good so far," hoping your demo will have the intended effect. It works when Bif grumbles, "Hand me that there mouse, and let me check this out myself."

First Impressions of Dpaint

Dpaint ST is distributed by Electronic Arts on three single sided, non copy-protected disks. The main program disk is the one most extensively used; the other two contain examples of pictures and animations created with D-paint, as well as some tutorial files useful in the walk-thru lessons in the documentation.

Filling out the package are a reference pamphlet and 200+ page spiral-bound manual. Although the package is clearly designed for both American and European distribution (notably, British spellings), the software design team (Artistech Development) is American and this is thankfully reflected in the package design.

Much recent software is designed around the "get-going-now" philosophy: a minimal reading of the documentation and installation instructions is all that is required to launch the application and do some productive work. Dpaint is no exception to this trend.

The main "work screen" is split in half by a menu bar where tools are selected. The top half of the screen is a window on to the full drawing screen, and the bottom half is divided into a zoom window and control box. The drawing tools can be used either in the full-size or zoom window. Further interaction with the program is controlled through sub-menus. All of this should be familiar to some extent to users of other ST paint programs.

Tools of the Trade

Most interactions with Dpaint are through left- or right-clicking menu bar selections. Left-clicking [selecting] a menu item activates either the default tool or the one last chosen, while a right click activates the appropriate sub-menu for that tool. When using a drawing tool in a drawing area, the left button draws with the foreground color, and the right button uses the previously-selected background color.

This use of the mouse buttons is central to the operation of D-paint, and is both intuitive and consistent throughout the whole program. Hence, you spend less time trying to remember how the mouse-buttons behave under each option and more time creatively using the program.

All the tools are available on the menu bar, and most are selectable with keyboard equivalents. I am going to assume a basic knowledge on the reader's part about paint programs and focus on the unique features of Dpaint.

Drawing: The basic drawing tools for creating freehand shapes, lines and a variety of boxes and circles, work as one might expect. There are quite a few user-controllable functions in each icon's sub-menu, such as brush width and segmentation (stippling). There is also a tool for producing Bezier curves which is surprisingly simple to use. A left-click selects the starting point, end point and two control points. The curve's shape is determined by the location of these points—to produce any curve merely involves dragging the four points until the desired shape is achieved, then fixing them to the screen by right clicking.

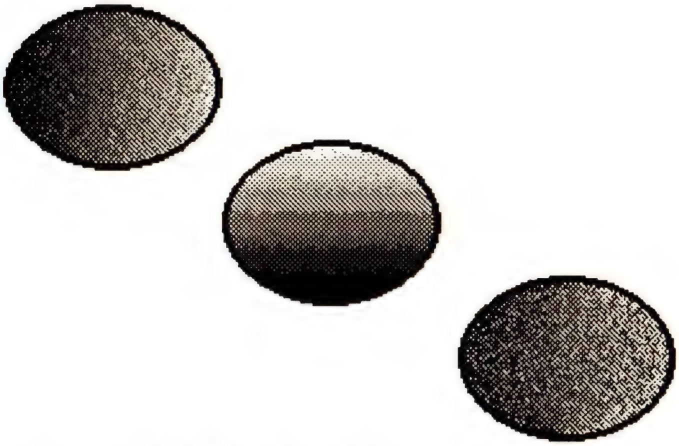
Airbrush: Another familiar paint tool, it produces a random spray of dots on the screen. Controls which select the size and intensity of spray are available from the sub-menu, as well as a palette control, which allows the user to individually control a selected group of colors as well as their spray rate. For example, if you are painting clouds, you might use the palette control to create a spray that is mostly white, with a lesser saturation of greys or other colors.

Fills: This tool allows the user to flood any enclosed shape with a color. Fills can be solid, dithered (a checkerboard effect using foreground and background colors), pattern or gradient. Gradient fills are one of the more powerful features of the program and are used to produce 3D, metallic and lighting effects. Sliders and buttons designate the blurring between color bands, the angle of the gradient and whether the fill conforms to the object shape.

Text: Many programs allow the typing of text on the work screen. DPaint ST also allows a wide variety of choices about the style of text you use. Text can be in the standard Atari system font or chosen from the many proportional, scalable, even multi-color fonts provided on the distribution disk. There are even provisions to edit or create your own fonts!

Define Brush: This icon has a three-fold use. The first is the "grabbing" of a section of screen to define a brush shape for stamping or painting the work area. The second use duplicates the "block" function of other paint programs, allowing various manipulations of the selected brush (see below) and the loading/saving of brush information. Brushes can be sized, rotated, skewed and manipulated in a wide variety of ways. Brushes can be carved (lassoed) with a selectable option—you can pick up an irregularly shaped portion of the screen for use as a Brush, instead of being forced to select a square or rectangular screen block. Thirdly, many of the Animation facilities of Dpaint ST rely on a selected Brush to do their work—more on this later.

Brush Mode "FX": This tool determines the painting behavior of the selected brush. You can simply draw on the screen with the selected color. Dpaint also allows you to smear or half-smear colors, cycle through a range of color, filter (shading of all colors into a selected color), blend intermediate shades between the brush and painting area, tint (change painted area to a color closer to that of the selected brush) or smooth. The smooth mode is perhaps the most powerful—painting along any border between highly contrasting colors causes the placement of intermediate shades under the brush. This causes an "anti-aliasing" effect, reducing the "jaggies" or stair-step effect common in computer-created pictures. The intermediate shades reduce the perception of noticeable, individual pixels in a picture.



Magnify: Selecting this icon toggles the magnify/zoom window. Options available include setting the magnification (from 2 to 16 times), magnifier position (which can be scrolled about the painting area with arrow buttons or the cursor keys) and segmentation—each pixel is enclosed with a border for clarity.

Color: The palette sub-menu controls color with either RGB or HSV (hue, saturation and value) sliders. Colors can also be copied from one to another, spread across a range (selecting a start and end value re-maps all colors between to intermediate shades). You can also swap and remap colors. Color ranges are designated in this dialogue box as well. Range information is used in color cycling animation and for tools such as gradient fill. There are four separate range buttons, and each can contain entirely different color group and color cycling information. A stencil tool allows "fixing" of either a range of colors or the current picture, preventing unwanted painting changes. If a range of colors is designated, no drawing will "stick" to the selected colors until the stencil is deactivated. The background (current picture) can be fixed, so that any changes made to it can be erased with no damage to the original work.

Miscellaneous Tools: Mirror causes the mirroring of what you draw. You designate a point or line of symmetry as vertical, horizontal, diagonal or a given point on the screen. Selecting grid confines the brush's movement to an invisible grid. Dpaint can load or save in its own format [IFF] or can load/save single frames in any standard ST format: Degas, Degas Elite or NeoChrome. Also available is an option allowing you to format disks, copy/move/delete files and so on. UNDO takes back the last change to the picture. Finally, the CLR button will wipe the workscreen clean to your selected background color or to the background fixed with the Stencil tool.

Animation: All of Dpaint's animation capabilites are controlled through two tools. The tweening tool allows sizing, rotation or distortion of a selected brush about the x, y or z axis. These transformations are performed with respect to a user-definable origin/vanishing point. These transformations can be confined to a single frame or designated across a range of animation frames. The animation tool governs the other animation functions. Dpaint ST uses page-flipping: each screen consists of one frame of animation, and continuous motion is created by the sequential display of animation frames.

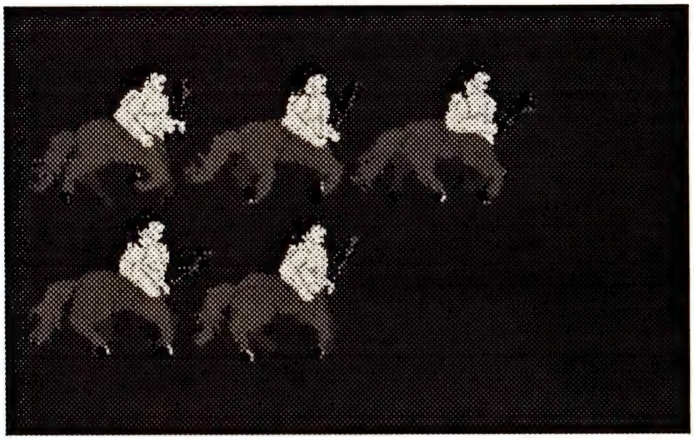
Strolling About

After working with Dpaint ST for any length of time, several things become noticeable. First, you can't stray far from your keyboard. If you don't use the Magnify window, you can reclaim most of the drawing space it consumes, but if you call any of the Sub-Menu functions the window re-appears. After you make your selection, you can toggle the display off again with a press of the spacebar. Conversely, you can dispense with the menu bar entirely; most of the tools have a keyboard equivalent. Most users will probably rely on the menu bar until they memorize the keyboard commands.

While I can't fault the authors in this design philosophy, it leaves me wishing I had either a third mouse button for toggling the menu bar or a third arm (one to move the mouse, one to push the letter keys and a third to push the ALT key!)

Other parts of the user interface are better. Mouse pointer response is the best I have seen for any ST paint program. With a few exceptions noted below, the user doesn't bump into any unwelcome deviations from the "ST way" of doing things. The learning curve is very low—any typical user could putter away with the program with a minimal examination of the manual.

With the wide variety of tools available, one sometimes gets the feeling the software is doing *most* of the work! No other program makes the production of smooth curves or shaded objects as effortless. Experienced computer artists will feel they are getting the most out of their computer's graphics horsepower without wrestling with a bulky or confusing user interface. Novices will enjoy the ability to produce interesting designs without hours of tedious editing.



This strength of interface extends to the animation and other sophisticated tools. Many of the functions available in Dpaint can be found in other ST packages, but *none* have been available in *one* package! No longer must the ST artist learn the quirks of one program's interface then un-learn them when booting another package, or master the arcana of different (and non-compatible) file formats.

If the user feels the need, he/she can save their work in any of the common ST file formats without a separate conversion utility, or in IFF format, which is easily accepted by Amiga and MS-DOS systems. Dpaint ST is a winner on all counts—not only does the user purchase one of the best paint programs for the ST, they get a full-powered animation program at the same time.

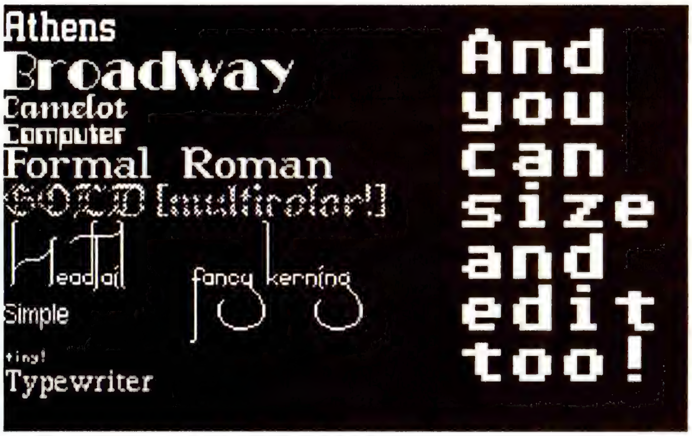
Finally, I would like to express my gratitude to the authors of the manual. All information the user might need is readily available in the Reference section, and all of the software tools are walked-through in the Tutorial section. The layout is neat and logical, writing is clear and concise and the index is accurate and complete! If more manuals were written like this, piracy would vanish overnight.

I had the misfortune of learning Dpaint III for the Amiga with its reference manual. It was written by the software's author, and although it had many more pages than Dpaint ST's manual, it was rambling in many places and often incomplete or inaccurate in describing the use of its functions. Who wants to wade through 250+ pages of "Let's play with this feature to learn how it works" when a simple and concise explanation would be more helpful?

Mona Lisa has a Wart

Dpaint ST is an excellent application, but it is not "insanely great." One of its biggest flaws is its 'robustness'. It seems very intolerant of sharing memory with any desk accessories or AUTO programs. I have had it crash when the only resident program was my ICD Hard Drive booter software (the solution was to turn ICD's cache off). While there might be some programs out there that can live happily with Dpaint, I have given up trying. Not that having desk ACCs would matter—Dpaint is a TOS application.

I do wish I could use Little Green Selector and MaxiFile instead of Dpaint's thin offerings. While anyone who uses an Amiga would know that a "parent" button backs out of a subdirectory and a "drives" button brings up a drive/partition selector, most ST users (quite reasonably) expect to use the more familiar GEM file selector or their own favorite replace-



ment. Dpaint's own replacements for these file functions could bear a closer resemblance to the ST norm.

Other flaws are minor. Despite the manual's claims, saving a file with IFF Byte Run Compression does not make an Amiga-compatible file. You should use the seperate convert utility for that or save in an ST-compatible format. This software supports low resolution *only*. While I don't think many artists use medium resolution, I do artwork in high resolution and wish this program did as well. Support of other ST animation formats would also be welcome. Finally, it would be nice if the Magnify window were sizable or followed the mouse pointer more smoothly when scrolling around the drawing area.

I don't consider any of these faults crippling. Most users have already cultivated a "save often" habit, and the program seems reasonably stable when not overly taxed.

Keeping Up with the Joneses

ST users have long suffered comparisons with that "other" system. There is no doubt the other's custom graphics coprocessors give special effects and graphics modes that make Atari users envious. But, let me assure you, these internal differences do not handicap Dpaint ST when compared to its counterparts on other platforms. Aside from the inherent differences in graphics modes, the "common standard" of 320x200 pixels with 16 colors is identical on both machines: animations created on the Amiga and Atari ST are indistinguishable and readily converted.

After having used an Amiga and Dpaint III in software graphics development for several months, I can say with confidence that the utility of both systems are equivalent. The Amiga may get the nod for speed in some operations, such as brush sizing or complicated fills; the ST's interface seems less clunky and more intuitive. Most other differences are cosmetic and minor. The ST even gets a small advantage in memory: the minimum requirement for animation on the Amiga is one megabyte, but Atari users can create simple animations with just 512K!

Odds and Ends

Included with Dpaint ST are three small utility programs. The first lets you print your works on a variety of black & white or color printers. I have tested the Hewlett Packard laser driver and it seems adequate. I saw the utility printing in color at a recent Atari Show (on an HP PaintJet) and the output was quite impressive. There are printer drivers for most dot matrix printers as well. Controls let you adjust the type of greyscaling and palette—if your picture is made of hues close to the same brightness, the palette must be adjusted or you will get a uniformly-grey, unsatisfactory printout. Options seem sufficient for most users, although most desktop publishing programs, such as PageStream, will do a better job.

Also on the disk are utilities for converting non-ST IFF files to Amiga IFFs and a stand-alone program for viewing pictures and animations (a must if you have limited memory and want to view the larger animations). Each program works as it should.

The Big Picture

I am definitely pleased with this package. It fulfills every expectation I had when I purchased it, and even gave some surprises—I did not expect Amiga-quality animation abilities on my ST with such little effort! Whether you buy it will be your decision. If you use one of the older ST paint programs, you will enjoy the many new drawing tools and might find the animation tools a welcome bonus.

If you have interest in animation on your ST but have found learning software like Cyber Paint intimidating, the friendliness of Dpaint's interface is worth a look. The integration of these functions in one package is reason enough for consideration. Whether you are a mouse Rembrandt or have trouble drawing a straight line with a ruler, Dpaint has something to offer.

Please support this product with a purchase if you plan to use it. Let's hope the ST community shows the software manufacturers that it is worthwhile to market powerful applications like this for our machine.

ATARI REPAIR!

RISING STAR COMPUTER PRODUCTS is proud to announce a full service repair center for Atari computer products. It has been our experience that many Atari users are "out in the cold" when it comes to repair. Many users don't have a Atari dealer located in their state, much less within the local area.

We offer an easy painless solution. Simply contact us between 6 PM - 9 PM EST on our information line 1-513-254-3160 and explain the problem. We will ask you for the proper information needed to get the ball rolling. Next we will issue you a repair number so that you can send the item to us.

A non-refundable deposit is required for all repairs. Deposits vary depending upon the equipment being repaired. A listing is given below.

ST HARDWARE

520 ST / STFM	$ 65
1040 ST /STe	65
Megafile 30	65
SC1224 Monitor	$ 65
SM124 Monitor	65
SF314/354 Drive	45

8-BIT

400/800/XL/XE	$ 45
1050 Drive	45
XF551	45

After we discover the exact problem, we will contact you, tell you the problem and cost of repair. The cost of repair is total cost (including shipping) minus deposit. If you decide to initiate repairs, your item will be fixed and shipped back to you with a 90 day warranty on parts and 30 day warranty on labor. If you decide against repairs, your equipment will be shipped to you with a statement indicating problems. Your deposit covers diagnostic and initial labor costs. If for some reason we cannot find the problem you will receive you equipment back along with deposit.

Our repair center is staffed with personnel who have over 10 years experience in repairing Atari and other equipment. We at RISING STAR hope this service proves to be invaluable to the Atari community.

ICE SYSTEMS

We build fast hard drives at prices hard to beat!

ICE-20	Meg	(28ms)	$ 489
ICE-30	Meg	(28ms)	519
ICE-50	Meg	(28ms)	559
ICE-60	Meg	(24ms)	599
ICE-85	Meg	(28ms)	579
ICE-140	Meg	(15ms)	1089

Don't fool around with slow 40ms hard drives. We build fast hard drives at the best prices. Every one of our drives is 28ms or faster! To assure highest quality we use ICD Advantage + host adapters (that's the one with the built in clock) and Seagate Hard Drive Mechanisms. All drives are fully assembled, tested, formatted and guaranteed trouble free for one year. When you receive the drive it will be ready to plug in and go!

Mail Orders To: P.O. Box 20038 ★ Dayton, Ohio 45420-0038

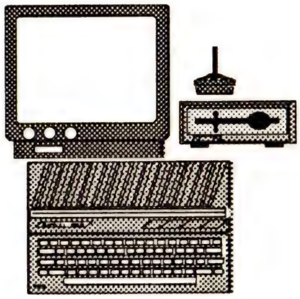
PIA Upgrade



Charles Hughes

Commercial, non-user group magazines are prohibited from printing this article without written permission from the author.]

So, you're a hacker are you? Well, then this upgrade is for you. If you aren't a hacker, well, have a try at it anyway. This upgrade can be done on *any* 8-bit computer, but these instructions only cover the 800XL and 130XE machines.

Performing this upgrade gives you a second PIA chip in your computer. You are probably wondering just what a second PIA chip can do for you. The answer is— anything you could do with the first, only better! Some possibe uses are listed at the end of this article.

First, here are some standard precautions. Opening your machine voids any warranty you may have. CMOS chips hate static, so ground yourself before working on your computer. Finally, the author of this text and the publishers of this magazine are not responsible for what you do to your computer. If you aren't proficient at soldering, don't know a socket from an IC or feel you are a total incompetent when it comes to the inside of your computer, then *don't touch!*

Parts List

1 65C21 [PIA chip. There are several versions of the PIA chip. Any of the following will work: 6520, 65C20, 65C21, 6820, 6821 and, of course, C014795 (Atari's chip #)].
1 74F139 (Dual 2:4 decoder)
1 74F138 (3:8 decoder)
1 16-pin IC socket
1 small perfboard, about 2" x 3"
Wire (lots of it, Radio Shack #278-372; 24 gauge, 4 conductor telephone wire works great)
Phillips screwdriver
Pair of needlenose pliers
Rosin Core solder
Soldering Iron (25 to 30 watt)
Desoldering Iron (or solder sucker but do not use solder braid)
IC Puller, etc
Several small cups for holding screws

Most XE computers will also need:
1 16-pin IC socket
1 40-pin IC socket

What to Do

Completely disconnect all cords, cartridges and other items not permanently attached to your computer. Lay them to the side so they can be reattached when you are finished.

Find a place in your house to do the actual work—it should be well lit, have a power outlet nearby and be safe from "accidents" (like little kids interested in the pretty parts of your computer). Sit down, put your computer on the table (bench, workspace, whatever).

Turn your computer over. Remove the Phillips screws that hold the bottom cover on. Place the screws in a cup. Don't lose the screws, they are a pain to replace.

Ok, here is the first fun part— turn your computer back over and gently lift off the top. Place the top somewhere safe. Note: On the XL series, the keyboard may be attached to the top. Take the keyboard and slowly lift up. You will find it is attached by a ribbon cable. Pull this cable free of the main board and then place the keyboard with the top.

Locate the screws spaced around the motherboard that hold it onto the bottom. Remove these screws and put them in a second cup. Note: Some machines aren't attached with screws, you can just lift the motherboard free of the bottom case.

Pull the motherboard free of the bottom case. This is a little difficult, but if you do it slowly and carefully you won't hurt anything. Put the bottom cover to one side.

Now, it's time to remove the metal shields. On some models, the metal shields are attached by screws. Remove these to remove the shields. On other models, the shields are held on by little metal tabs. Using the pliers, twist the little metal tabs to release the top metal shield. Remove the top and bottom metal shields and place them to the side.

Place the motherboard, chip side up, in front of you. Position the motherboard so the joystick ports are to your right. Look at the 40-pin IC's and locate the one that has "6520" and/or "C014795" printed on it somewhere. This is the PIA chip already installed in your computer. In the 130XE, it is near the joystick ports. In the 800XL, it is the rightmost chip nearest you.

Look around the board for a small 16-pin IC with "74LS138" printed on it. This IC enables the PIA when it is accessed by the CPU. On the 130XE, this IC is just below the PIA. On the 800XL, this chip is the second IC down from the cartridge port.

Remember where these are...we'll be coming back to them.

Out with the Old

Now comes an easy or hard part depending on the machine you have—removing the PIA from the motherboard. If the PIA is socketed, this is easy. Just use a small screwdriver to pry up each end a little at a time until you manage to free the entire chip. If the PIA is soldered in, pull out the desoldering iron. Desolder the PIA and solder in a 40-pin socket.

Remove the 74LS138 chip same as you removed the PIA. Solder in a 16-pin socket if necessary. Place the 74F138 in the socket. Put the 74LS138 in a safe place. You might be able to use it for some project in the future, but you won't need it for this one.

Take the new PIA (called PIA1 from now on) and bend pins 16 and 23 up so they stick straight out from the sides of the chip. Note: If you have a memory upgrade that uses other pins on the old PIA, you can bend up the same ones on PIA1 and reattach the wires there.

Take the PIA you just removed (called PIA2 from now on) and bend pins 2-19, 23 and 37-40 straight out the same way. Place PIA2 on top of PIA1 so that all the pins not bent up on PIA2 touch the same pins on PIA1. Solder pins 1, 20-22 and 24-36 of PIA2 to the same pins on PIA1. Put this set of chips to the side for now.

Creating a Circuit Board

Now we have to create the minor circuit needed for the upgrade. Take the perfboard you have and put the 16-pin socket on it. The best place for it is in the upper left corner of the board.

There is a notch in the black plastic of the chip. This indicates the placement of the IC chip. Holding the socket so that the notch is away from you, pin 1 is the first pin on the left-hand side, pin 2 is the one below it, etc. all the way to pin 8, the last pin on that side. On the right-hand side, opposite pin 8 is pin 9, opposite pin 7 is pin 10, etc. all the way to pin 16 which is opposite pin 1.

Cut seven pieces of wire about eight inches long and strip off about a one quarter inch of insulation on each end of all the wires. Solder one end of each wire to pins 1-5, 8 and 16.

Take the wire you soldered to pin 8 and solder the other end to pin 8 of the 74F138 you located earlier. If you prefer, you can solder wires that would attach to the 74F138 to the back of the motherboard. Just make sure you solder them to the correct pins of the '138 socket.

Solder the wire from pin 16 to pin 16 of the 74F138. Solder the wire from pin 1 to pin 12 of the 74F138.

Solder the wire from pin 4 to pin 23 of PIA1. Solder the wire from pin 5 to pin 23 of PIA2. Insert the stacked PIAs into the PIA socket.

Take the 74F139 chip and place it in the 16-pin socket so that the notch in the chip is pointing in the same direction as the notch in the socket.

You now have two wires left unconnected. These two wires need to be connected to address lines A2 and A3. You can connect these wires to A2 and A3 anywhere you like, but the easiest place to solder these wires is to the ANTIC chip. Find the chip labeled "C021697." This is the ANTIC.

Solder the wire that comes from pin 2 of the 16-pin socket to pin 11 of the ANTIC chip (address line A2). Solder the wire that comes from pin 3 of the 16-pin socket to pin 10 of the ANTIC chip (address line A3).

Another place to get these lines is from the parallel bus. On the 800XL in the upper left-hand corner are a pair of IC chips. The top chip is BASIC, the chip beneath it is the OS ROM. To the right of the OS ROM is a line of solder points. The first point is A2, the second is A3.

If you have a 130XE, look at the cartridge port. It should look like this:

```
     | | | | | | | | | | | | | | |
ECI  | | | | | | | | | | | | | | |   SIO
      . . . . . . . . . . . . 2  .
                               .
                              .  3
                              . .
```

This is a really rough drawing. The | indicate pins on the cartridge port, the . are solder points, the 2 is the solder point for A2 and the 3 is the solder point for A3. Just melt the solder at these points and stick the appropriate wire into the solder while it is still molten. ECI is the small connector to the right of the cartridge slot, while SIO is the 13-pin SIO connector to the left of the cartridge slot.

1200XL, 600XL, 65XE and XEGS owners are on their own. I do not have any of these machines available to find suitable solder points. I believe the 600XL is identical to the 800XL as far as the parallel bus is concerned, so you may be able to find the solder points in the same place. Remember, however, that soldering to the ANTIC chip will work regardless of the machine.

You need to put the perfboard in a safe place. If it is just hanging in midair, let it keep hanging for now but don't let any of the pins touch anything else. Check all your connections and make sure you have followed all the steps above.

You have now finished all the necessary wiring. Now you have to test the finished product. Don't bother putting it all back together yet, just grab the bottom case of the computer and lay the motherboard in it. Plug in a BASIC cartridge (if you don't have any memory upgrades, you don't need to use a BASIC cartridge). Connect the video cable and power cord. Turn on the computer. If you don't get a "READY" prompt and a blue screen, turn off the computer immediately and recheck all your work.

If you do get a "READY" prompt and blue screen, type in the following program:

```
10 P1=54016:P2=54020
20 ?PEEK(P1),PEEK(P1+1),PEEK(P2),PEEK(P2+1)
30 GOTO 20
```

RUN the program. The first two numbers shouldn't change. The next two numbers may change and *won't* be exactly the same as the first two. If you stick a joystick in port 0 or 1, you can vary the second number. If the numbers are all the same or all of them keep changing, turn off the computer, remove the power cord and recheck all your connections.

That's all there is to it! Reassemble your computer in reverse order of the way you disassembled it. :) Of course, you'll need to do something with the perfboard. Cover the pins of the 16-pin socket with an insulator (electrical tape or pieces of antistatic foam work well for this). Turn the board over slowly and push it face down in an open space on the motherboard. You should then be able to put the metal shield back on. If you can't, don't worry about it unless you get TV interference. If you get TV interference, move the computer further from the TV. :)

You now have a second PIA chip located at addresses 54020-54023 ($D304-$D307). Here is the pinout of a 6520 (6521, 6821, 65C21, 6821B, etc):

Pin		Function
1	GND	This connects to the system ground.
2-9	PA0-PA7	These are the port A pins.
10-17	PB0-PB7	These are the port B pins.
18	CB1	This is control line 1 of port B.
19	CB2	This is control line 2 of port B.
20	POWER	Connects to the system (+5 volts).
21	R/W	This is the system read/write line. The line above the write indicates that writes occur when the line goes low (0 volts).
22	CS0	Chip select 0.
23	CS2	Chip select 2. This is an inverted signal - the chip is selected whenever CS2 goes low.
24	CS1	Chip select 1.
25	E	This is the system clock line.
26-33	D0-D7	These are the system data lines 34
	RESET	When this line is pulled low the chip performs a reset. This reset forces all pins to input.
35-36	A0-A1	These are address lines A0 & A1 from the system bus.
37	IRQA	Port A IRQ.
38	IRQB	Port B IRQ.
39	CA2	This is control line 2 of port A.
40	CA1	This is control line 1 of port B.

And here is a short memory map of the new PIA.

PIA2: 6520 CHIP

54020 $D304 PORT2A

(R/W) Controls the port A pins on the second PIA. Writes to direction control if bit 2 of PACTL2 is zero. This port should be used for memory upgrades. To access any bank of extended memory using this port, the extra lines needed for the memory should be attached in order starting at pin 2. A routine to access the extended memory is given below:

BASIC

```
X =INT(BANK_NUMBER/4)
P2=BANK_NUMBER-X*4
Q =PEEK(54017)
Y =Q-INT(Q/4)*4
Z =INT(Q/32)*32
P1=Z+32+X*4+Y
POKE 54020,P2:POKE 54017,P1
```

Assembly Language

```
LDA BANK         ; Load the bank number
TAX              ; Save it for future use
LSR              ; Divide by 4
LSR
TAY              ; Save the upper bank control #
TXA              ; Reload original bank number
AND #%00000011 ; Mask out rest of bank number
ASL              ; Mult by 4 to get into position
ASL
STA TEMP         ; Save again
LDA PORTB1       ; ($D301, 54017) Load the normal
                 ;   bank control
AND #%11100011 ; Zero out old bank control bits
CLC
ADC TEMP         ; Add new bank control bits in.
STA PORTB1       ; Select extended RAM and lowest
                 ;   2 bits of the bank number.
TYA              ; Get the upper 6 bits
STA PORTA2       ; Store upper 6 bits of bank #.
; 8 bits worth of banks is
;   256 - 16K banks = 4 Megabytes.
```

54021 $D305 PORT2B

(R/W) Controls the port B pins on the second PIA. Writes to direction control if bit 2 of PACTL2 is zero. This port should be used as a parallel port. The most likely use would be a centronics printer port.

54022 $D306 PACTL2

(R/W) This is the PORT2A controller. Check out "Mapping The Atari" or a datasheet on the 6520 PIA for more information on this.

54023 $D307 PBCTL2

(R/W) This is the PORT2B controller. Check out "Mapping The Atari" or a datasheet on the 6520 PIA for more information on this.

Questions, Questions...

Here are some questions that will probably be asked about this upgrade and the answers to them.

Why use two address lines to select only two PIAs?

Several reasons—the specific chip used (74F139) is a DUAL 2:4 decoder. This means, using two address lines, it can select four PIAs. If you want yet another PIA, just solder it on top of the others. Then run a wire from pin 6 of the 16-pin socket to pin 23 of the new PIA and you have a third PIA. A fourth PIA works the same, except the wire comes from pin 7 of the 16-pin socket. Also, most memory upgrades use a 74LS138 or 74LS139. Since we only use one of the two 2:4 decoders in the 74F139, and all memory upgrades (except my monster 4 MEG one!) use the equivalent of one 2:4 decoder, we can remove the other chip and rewire the memory upgrade so it uses our 74F139.

Why use a perfboard? Why not just put the 74F139 on the motherboard someplace?

Easy question. The reason for this is so you can add other circuits to the perfboard and not lose access to any of the chips on the motherboard. The perfboard has enough space to hold the ICs needed for any upgrade and that is what I use it for in my computer.

Why did you replace the 74LS138 on the motherboard with a 74F138?

Because the 74LS138 was too *slow*. My first attempt at this upgrade frustrated me so much I quit for a few weeks in order to avoid attacking my computer with a sledgehammer.

Future Project

Here are some possible hardware projects to make use of your new PIA:

Restore the two missing joystick ports. This isn't difficult, but currently no software except that which you write yourself would work. You can add two joystick ports almost identical to those the 400/800 had.

Add additional internal ROMs—multiple OS, BASIC and ASSEMBLER, etc. The XEGS machine has BASIC and Star Raiders built in. There are several ways this could have been done. The most likely is through use of bit 6 of port B of PIA1. Port B controls bank selection and bit 6 is the only bit unused in the 130XE, so it is the most likely candidate for controlling whether BASIC or Star Raiders is accessed. There is no reason you can't have BASIC and Star Raiders built in too. Nor is there any reason you couldn't have any cartridge built in.

Really get sick and control up to 8 megs of internal memory. This is my main reason for adding the second PIA. I bought 144 256K DRAM chips cheap, so I wanted to make a *huge* upgrade. I haven't done it yet, but I probably will add 2 MEGs right onboard my computer. (There is a use for this, see below.)

Run several "virtual" machines. Tom Hunt of MTOS fame created a wonderful program called Snapshot. It takes a 'snapshot' of what your computer looks like and stores it in extended RAM (i.e., 16K RAMbanks found on upgraded machines and 130XEs).

Each snapshot takes up 64K (4 banks). You can then switch snapshots by pressing a few keys. You could have Textpro running, activate the Snapshot program and then be in Bobterm. The Snapshot program creates a "virtual machine" that it swaps in and out of main RAM when snapshot is activated. With Tom's help, I plan on creating a special upgrade that does in hardware what he is doing in software. So, when Snapshot is called, instead of the program actually copying the main RAM to the extended RAM, it will just swap RAM in 64K chunks. This will speed up the snapshot process and make it considerably more useful.

Add a centronics parallel printer interface. This is easier than it might sound at first. The PIA is made for exactly this type of work. A few wires, a centronics connector and some software and you have a standard printer port.

Add an RS232 port. This is an extensive project... not hard, but not anywhere near as simple as just adding the PIA. However, it would cost a lot less than an 850 interface and would work better, too.

Get rid of all the nasty switches you have stuck in various places on your computer! Except for the cold start switch of course. :) Certain upgrades require switches in order to enable/disable banks of RAM so that the switchable BASIC, ANTIC, SELFTEST and OS can be used. This is silly. Just rewire the upgrade so that it uses port A of PIA2, and you have all the extra memory you need accessible all the time. There is a catch of course...there is no software that recognizes this second PIA, *yet!* I'll have an RD.COM file for Sparta ready soon and a fix file for MYDOS when I get the chance.

SpartaDOS X is a whole other ball of wax...I can modify the RAMdisk driver I think, but since the SDX cart looks for the total memory available when it first boots, I don't think I can write a patch for it. ICD has promised to do so if this upgrade is popular enough. So let's make it popular, ok? :)

Those are just a few uses for the new PIA that I could think of off the top of my head. I am sure others will occur to me and, hopefully, to you.

If you have any questions or comments I can be reached at:

ATARI 8-BIT

SOFTWARE - PARTS AND BOOKS FOR ATARI XL / XE & 800/400 COMPUTERS

1050 MECHANISM

Factory fresh TANDON mechs. make difficult repairs a snap. Units are complete with Head, Stepper, Spindle motor, belt etc. Just plug in, no difficult alignments or adjustments required.

$\$47^{50}$

POWER PACKS

Exact replacement transformer for 800/400, 1050 810, 1200XL, 850, and XF551 units. Part #CO17945.

$\$14^{50}$

XL/XE SUPPLY

Power Pak for 800XL,600XL 130XE, 65XE & XE Game.

$\$25^{00}$

KEYBOARDS

New and complete subassembly.
Easy internal replacement.

130XE/65XE	$35.00
800	$40.00
800XL	$29.50
400	$12.50

XL 40 PIN LSI CHIP SET

A Complete set of 40 Pin Large Scale Integrated Circuits for your 800XL, 600XL or 1200XL computer.

Great for quick repairs! Set contains one each of the following: CPU, GTIA, ANTIC, PIA AND POKEY.

$\$16^{95}$

800 4 PIECE BOARD SET

Includes Main Board, Power Supply Assembly, CPU Module and 10K Revision B Operating System Module. All boards are new, tested and complete with all components. $28.50

800/400 MODULES

NEW PARTS COMPLETE WITH IC'S

• CX853 16K RAM Module	$9.50
• 800/400 CPU with GTIA	$8.75
• 800 10K "B" OS MODULE	$8.75
• 800 POWER BOARD	$14.50
• 400 POWER BOARD	$9.50

MISCELLANEOUS

600XL 64K UPGRADE KIT	$29.95
13 PIN SERIAL I/O CABLE	$4.50
SPECIAL - 3 I/O CABLES FOR	$10.00
ACE JOYSTICK	$7.95
POWERPLAYER JOYSTICK	$19.95
U.S. DOUBLER	$27.50
400 BOARD SET (W/O Kybd)	$22.95
PADDLE CONTROLLERS	$9.95
REV. "C" BASIC ROM IC	$15.00
RAMBO XL w/o RAM IC's	$27.50
850 or PR MODEM CABLE	$14.50
850 or PR PRINTER CABLE	$14.50
8-BIT MONITOR CABLE	$9.95
PRINTER INTERFACE	$43.95
P:R: CONNECTION	$62.00
I/O 13 PIN PC CONNECTOR	$4.50
800XL RF MODULATOR	$9.50
RF CABLE (COMPUTER TO TV)	$3.75
1050 TRACK ZERO SENSOR	$8.50
2793 - 1050 Disk Controller IC	$19.50
850 12pc IC set - all except ROM	$19.50
ANIMATION STATION	$74.95
SUPRA 2400 BAUD MODEM	$124.95

BOOKS

Mapping the Atari (XL/XE)	$24.95
Mapping the Atari (800/400)	$18.95
Compute's First Book of Atari	$12.50
Compute's Third Book of Atari (Includes a high quality type in Word Processor)	$12.50
First Book of Atari Graphics	$12.50
2nd Book of Atari Graphics	$12.50
Graphic Book Combo #1 & 2	$19.95
Electronic Computer Projects	$9.95

DOS 2.0 Reference Manual	$7.50
Tech Ref. Notes for 800/400	$19.95
Basic Playground Workbook	$5.95

SAMS Repair manuals for 1050, 800XL, 130XE, 800, 400 contain schematics, parts lists, labelled photographs, oscilloscope and logic level readings. $24.95 Each

ATARIWRITER + PLUS WITH SPELLCHECK

Complete Disk based package $29.95

BOOKKEEPER & KEYPAD

You get both Atari's 8 bit professional bookkeeping system and the handy CX85 numeric keypad for one low price. Packages Factory sealed

$\$19^{95}$ 4 DISK SET

VISICALC SPREADSHEET

Unleash the computing power of your 8 bit Atari with Visicalc. Compute everything from home finances to high powered financial projections. Hundreds of uses.

$\$19^{95}$ DISK

Super DataBase 1-2-3

INNOVATIVE PRODUCT CREATES AMAZING DATABASE APPLICATIONS EVEN IF YOU HAVE NO PROGRAMMING SKILL. ONCE YOU CREATE A PROGRAM WITH SUPER DATABASE IT BECOMES A STAND-ALONE APPLICATION THAT RUNS ON ITS OWN "GENERATE" YOUR OWN PROGRAMS TO KEEP TRACK OF EVERYTHING.
INCLUDES 137 PAGE MANUAL - 3 DISKS $\$59^{95}$

P:R: CONNECTION

Serial / Parallel interface for connecting a wide variety of standard RS232 modems and standard Centronics Parallel printers to your Atari 8-bit computer. Direct replacement for the 850 interface. $62.00

P:R: or 850 to Printer Cable	$14.50
P:R: or 850 to Modem Cable	$14.50

CARTRIDGES

For XL's/XE's 800/400

PAC-MAN Cartridge	$4.00
DONKEY KONG Cartridge	$5.00
DELUXE INVADERS Cartridge	$4.00
STAR RAIDERS Cartridge	$5.00
JOURNEY TO THE PLANETS Cart.	$4.00
WIZARD OF WOR Cartridge	$9.95
BALLBLAZER Cartridge	$17.50
FINAL LEGACY Cartridge	$17.50

ATARI 8-BIT SOFTWARE VALUES

Saracen
Datasoft

SARACEN Disk by Datasoft. Action-strategy arcade style game featuring 100 game levels. Make your way through mazes of stone walls that are patrolled by fanatical guards. Your only weapon is a longbow; but when your arrows shoot straight and true, they have the power to crash through walls and start a chain reaction of explosions. Mazes are booby-trapped with bombs; blue-steel balls thunder heavily after you; and locked doors present a challenge to your wit . . . **$9.95**

GREAT AMERICAN CROSS-COUNTRY
ROAD RACE

GREAT AMERICAN CROSS COUNTRY ROAD RACE Disk by Activision. Experience the most thoroughly demanding computer road rally ever designed. Through 25 U.S. cities, authentic right down to the arch in St. Louis. You shift the gears, redline the tachometer. Battle unexpected conditions and bad weather. It's guaranteed to put you through your paces. **$12.50**

FOOBLITZKY
INFOCOM

FOOBLITZKY Disk and board game by Infocom. For **2 to 4 players**. A unique game of deduction, strategy, and chance. Includes disk, playing board, maps, pen set and instructions. Actually numerous games in one, because **FOOBLITZKY** can be configured as many different games. It's a dog eat dog world as you rove the crowded streets and busy shops trying to deduce clues and find objects needed to win. . **$12.50**

Your greatest challenge lies ahead-and downwards.
ZORK I

ZORK I Disk. Interactive adventure by Infocom. Your greatest challenge lies ahead - and downwards. Enter a vast underground universe that is reminiscent of Alice's Wonderland - with a deadly twist. During your journey, you'll come face to face with creatures so outlandish, they defy description. And you'll wander through an underground domain so vast, with so many twists and turns that you'll find surprises every time. Bring back the incomparable treasures of Zork. **$14.95**

TEMPTATION.

To stumble into somebody else's computer system. To be someplace you're really not supposed to be. And to get the strange feeling that it really does matter. "LOGON is all you get to start with. That's it. From there, it's up to you. If you're clever enough and smart enough, you could discover a world you've never before experienced on your computer. Very tempting.

HACKER

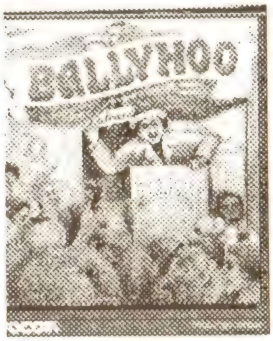
HACKER Disk by Activision. A solid gold best selling Graphics and text adventure. **LOG ON PLEASE**: and stumble into somebody else's computer system in this telecommunications mystery. Who are the guys running this **BBS** system? What are they doing? Plunge into every hackers dream in this most mysterious game ever. (No modem or phone line required). **$12.50**

Cutthroats

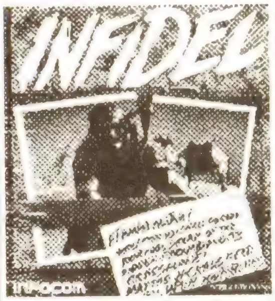
CUTTHROATS Disk. Interactive Adventure by Infocom. Your about to get yourself into very deep trouble. You're the top diver on an island and the foremost expert on local shipwrecks. It's simple, all you have to do is locate and salvage a fortune in sunken treasure, you'll have to survive the perils of diving in unknown waters - and the even greater danger of an untrustworthy crew. Good luck. . **$14.95**

THEATRE EUROPE
Datasoft

THEATRE EUROPE Disk by Datasoft. A War Simulation Strategy Game. You are in command of a vast array of conventional forces and weapons. Take part in each battle as a fighter pilot, tank commander, helicopter pilot, or ground soldier. A chemical or nuclear strike is always an alternative, but beware of the consequences: This is the nuclear age and survival of Europe is in your hands. Three levels of difficulty. The battlefield is Europe and you are in control. **$12.50**



BALLYHOO Disk. Interactive adventure by Infocom. Experience the traveling circus that time forgot. It's a place where your wildest dreams can come true. Then you learn how easily sweet dreams can turn into nightmares. Behind the scenes lies a seedy world of deception and crime. Danger lurks here, be careful or you might wind up as the next attraction in the freak show. . . **$14.95**



INFIDEL Disk. Interactive Adventure by Infocom. Ever wish you could discover and explore the ancient pyramids of Egypt? Now you can with **INFIDEL**, an amusing and frightening adventure from the masters of computer adventure games. You must locate the pyramid, gain entry to the tomb, decipher it hieroglyphics and unravel its mysteries one by one. . . . **$14.95**

Datasoft
NAPOLEON IN RUSSIA

NAPOLEON IN RUSSIA (BORODINO 1812) Disk by Datasoft. An award winning strategy war simulation featuring a historically accurate battle map. Replay Napoleon's battle at Borodino vs. the Russian Army in 1812. Variable skill levels with single or dual player modes. Game features include command over infantry, cavalry and artillery divisions. Features scrolling battle map with prominent terrain. Options cover fatigue, morale levels, battle speed & more. **$12.50**

The SEVEN CITIES of GOLD

THE SEVEN CITIES OF GOLD Disk by Electronic Arts. **1492 to 1540** was the age of discovery. The stage of history can belong to you in this highly rated, historically accurate simulation. Set Sail from Spain and discover the new world. Explore hidden gold mines and 200 different native settlements. How will you acquire gold? Trade? Trickery? Conquest? Over 2800 screens. **$9.95**

SEASTALKER

SEASTALKER Disk. Interactive Adventure by Infocom. There's something down there in the Ocean, something terrifying. You have to face it, because only you can save the Aquadome, the world's first undersea research station. Success won't come easily. It may not come at all, because if you challenge the deep without using all your wits, you just might wind up as shark bait **$9.95**

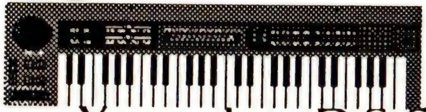
Comparing the Casio CT-460



vs. the Yamaha PSS-680

G.L. RAY (TACE)

Most ST users, I think, are either interested in, or already involved in creating music through the MIDI ports on their ST. Either they have a friend who has a keyboard or they've seen one demonstrated at a club meeting or store.

Getting Started

But most STers are not from a musical background, and they really don't have any idea as to what type of keyboard to get, what features to look for or answers to any of a million other questions.

I am not a musician, so I can relate to the many other non-musicians out there. But I do know a lot about music and sound. I've spent over five years working the soundboard for a couple of guys who sing all over Oklahoma and the surrounding states.

They were also one of the first groups to begin using their ST computers in their music and recording in our area. I very much appreciate what the ST can do through MIDI applications. I have seen the whole assortment of music software and hardware as it has advanced over the past five years. The group has tried every new product released.

Software-wise, I have been using Music Studio '88. It is not the most sophisticated software on the market, but remember, I said that I am not a musician. I do not read music well, play a keyboard or chart scores. Therefore, I do not need all of the whistles and bells of, say, a Dr. T's KCS or a Sonus Superscore.

Getting the Hardware

But I have learned quite a bit about music through my ST, and I do see myself moving up to a more fully featured package soon. If you are a beginner, I heartily recommend Music Studio.

Now, what type of hardware do you need? As a lot of people did, I started out with a Casio CZ 101 bought used at a music store. But I wanted more features, so I sold it and looked around for quite awhile before purchasing a Casio CT-460. The CT-460 has two features that I very much wanted: it is 16 note polyphonic and it has percussion as a pre-set sound.

This means that I did not have to go out and purchase a drum machine as well as a keyboard. The instrument has 49 fullsized keys, 30 pre-set instrument voices, and 20 built in rhythms. I paid $269 for the keyboard and I really have enjoyed it.

But I wanted more features, so I looked around for quite a while, again. My MIDI expertise had increased greatly, and I was quickly moving out of my price range.

I wanted a keyboard that had MIDI in, out and through. I wanted a keyboard that could access 16 different MIDI channels (The Casio CT-460 only accesses channels 1-4). I wanted an instrument that was multi-timbral. I wanted an instrument that has at least 100 voices to choose from. I wanted an instrument that had synth abilities, so I could create new sounds or modify the presets.

I found all of these, and more, in the Yamaha PSS-680, which I bought for $369, well within my budget.

This, so far, has been an introduction to what I really want to discuss, the comparison of these two keyboards, and maybe suggestions as to what you should look for when purchasing a keyboard for yourself.

The Casio CT-460 has been updated now, and I believe the new model number is the Casio CT-465, so some of the newer features of the Yamaha may be included in the new Casio model.

Comparing Features

First of all, when purchasing a keyboard to use with the ST, make sure that it is MIDI compatible. Look on the back of the keyboard for ports labeled MIDI. You should find at least MIDI In and MIDI Out. If you ever wish to use more than one keyboard at a time, you will also need MIDI Through. The Casio CT-460 does not have MIDI Through; the Yamaha does.

The next most important feature relates to the number of notes and instruments you can play simultaneously through your keyboard when accessed though the MIDI ports. The CT-460 is a 16 note polyphonic instrument, spread across 4 channels, like this:

Channel 1 - 6 note polyphonic
Channel 2 - 4 note polyphonic
Channel 3 - 2 note polyphonic
Channel 4 - 4 note polyphonic

What this means is that on channel one, for instance, I might play a six note chord on a piano. I might set channel two up to play a four note brass ensemble. Channel 3 might contain a two note bass lick and channel 4 might be set up as percussion playing up to four drum sounds at once.

Electronic Voices

This works very well, and I have arranged 30 or 40 songs over the past year on my Casio CT-460, in this, or similar set ups. But I would like to utilize more instruments at once, to fill the score with more instruments and give it a more professional quality. With the Casio CT-460, I am limited to four instruments and that's it.

The Yamaha PSS-680, on the other hand, is handled a little differently. Instead of allocating a certain number of notes across a limited number of channels, the PSS-680 uses what is called dynamic allocation. The PSS-680 is a 12-note polyphonic, multi-timbral keyboard, but the notes are allocated dynamically. That is, the notes are allocated across all 16 channels, as needed.

This allows you to use as many instruments and notes as you wish, across any channels you wish, as long as the total number of notes does not exceed 12 at any one time. If the total exceeds the maximum, the oldest note is dropped off. The advantage over the Casio CT-460 is that the Yamaha can play more than four instruments at once, allowing more flexibility and creativity.

The next most important thing, pehaps, is the number and quality of the pre-set voices. The Casio CT-460 has 30 preset voices across a wide range of instruments. The voices are all digitally sampled sounds and sound really good. But two of the voices are sound effects, such as honking cars and galloping horses. While these are fun for awhile, the novelty soon wears off, and you really wish you had two more instrument voices, like maybe a guitar.

The Yamaha, on the other hand, has 100 pre-set voices, ranging across an even greater variety of instruments (I had never heard of several of them). While I believe the Yamaha's voices are not as full and rich as the Casio's, the variety more than compensates for this.

The Yamaha also has various effects, such as vibrato, sustain, reverb, portamento, and chorus. And with the Yamaha, you also have the ability to modify or create and save sounds with the built-in digital synthesizer features.

Rhythms are featured on both keyboards. The Casio offers 20 rhythm choices, while the Yamaha offers 100. Both the Casio and the Yamaha offer a variety of rhythm control, but the Yamaha allows you to choose what instruments to be active on a particular rhythm. The Yamaha rhythms may also be accessed through MIDI channels 11-16. This allows quick arrangements with a one note melody line and a single note per measure to drive the pre-set rhythm chords, accompaniment and bass track.

To some people, the keyboard keys are an important factor. The Casio CT-460 wins hands down. Its 49 fullsize keys have a good feel and response, although they do not compare with higher priced keyboards. The Yamaha has 61 mini keys, which are definitely not a joy to play upon. But, as I said, I don't play anyway, so it doesn't matter to me.

Both keyboards have record and play functions, which I don't use since I use my ST. Both keyboards can be used to drive other MIDI instruments. The Yamaha has built in drummer pads, which, like the Casio's sound effects, are fun for awhile, but really serve no useful purpose. The drum sounds on the Yamaha are much better, I think, but the documentation on using them is nonexistant.

One would need to make a keyboard chart showing what drum sound corresponds with what note to be really useful, and I have not had time to do this, as of yet. There is a chart like this provided in the Casio manual.

Finally

So, which keyboard would I recommend? If you need a keyboard which you can play yourself, buy the Casio. If you want a wider choice of instruments and rhythms, buy the Yamaha. Buy both, and have the best of both worlds. But, by all means, get started in MIDI, you'll like it.

CODEHEAD SOFTWARE

The finest in productivity and utility software for the Atari ST

Announcing:

CODEKEYS

The Macro Tool!

The latest addition to CodeHead's streamlined fleet of luxury vehicles!

Automate any task on your Atari computer with CodeKeys! CodeKeys records all key and button presses and plays them back with precise timing, or as fast as possible! Use CodeKeys to assign keyboard equivalents to drop-down menus, to create a "timed save" function for any program, or to click on icons, buttons or windows! Fine-tune your macros with a flexible GEM-based editor - macros can be nested, looped, repeated, or delayed!

HOT WIRE

The Only True Alternative to the GEM Desktop!

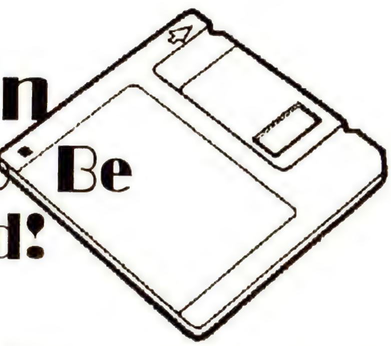
Public Domain
It Doesn't Have to Be Sold to Be Good!



Irwin Brooks (LACE)

Isn't it funny how some people react when you tell them your favorite desktop utility is Public Domain. Or when your friends are comparing the merits of their expensive word processors and you dazzle them with your PD's power?

I kind of get a kick out of it. Not that they wasted their money, just that there are some little known alternatives.

The power of ST commercial software is by far the best buy for your computing dollar. Compare the price of Ventura desktop publisher for the IBM PC or PageMaker for the Macintosh with either Calamus or Page Stream for the ST. A price ratio of 3 to 1 is not uncommon for these comparisons. The commercial Atari ST software is a bargain.

I, for one, bought my ST for this very reason. What amazes me however, is the quality of the Public Domain software making the BBS rounds these days. Programs I wouldn't have seconds thoughts of paying for are given away—*gratis!*

The only return for the authors' efforts are the recognition for a good program and the contribution they make to the continuing value the ST offers. No other rewards are evident.

The vast majority of these PD programs aren't the kind that make you wonder if the disk space has more value. To the contrary, most are the kind that make you wonder how you could live without them.

All different kinds of PD software is available (i.e. utilities, word processors, games, etc). At this point I would love to list all the best PD programs written for the ST, but the list would be too long to publish; I'd forget some or new releases would make my list outdated. Suffice it to say there are more than I can keep track of.

Now where do I get all these great PD programs, you ask? There are lots of places that can take lots of time. For instance, try your friends, your local BBS, mail order PD disks, etc. But, the best and timeliest source I found is the monthly AIM disk.

If you or your club is not getting the monthly AIM disk then you are:

1) Not an ST owner
2) Spending lots of time on the pay BBSes searching and downloading the latest PD software
3) Uninformed

The national BBSes are scanned and the best programs are downloaded for you and compacted in the monthly AIM disk. Brief program descriptions are included on the disk and in the magazine. All you have to do is execute the self extracting files to de-arc the files. Then run these programs like any other. It could not be easier.

If you're not already subscibing to the AIM Monthly Disk, you should be. When you do, you'll wonder why you waited.

DataFree's Memory Upgrade for the ST

Bob Retelle (MACE)

Two things a computer owner can never have too much of are memory and disk storage. On the Atari ST, expanding your disk storage is a fairly simple matter of just plugging in a new or bigger hard drive, but unfortunately, expanding your computer's memory is not that easy.

Up until the release of the TT, Atari Corp's official policy has been that none of their products' memory is expandable, including the STe. They recommend that you buy whatever system has the amount of memory you expect to ever need (which means you might as well buy a Mega ST4 in the first place).

In the never-ending quest for more memory, and to expand the non-expandable ST, designers have hacked and slashed, soldered, kludged and piggybacked.

The first popular method of adding memory, piggybacking, involved soldering more RAM chips right on top of the existing ones. This worked, and actually ended up as a very solid upgrade, but it involved the potential of destroying your ST and was a nightmare to debug if anything went wrong.

A far easier upgrade was developed which put all the RAM chips on a small printed circuit board which was then soldered to the main ST motherboard. This relieved most of the danger to the ST, but still required soldering skill for the installation.

Since most people don't have that experience with soldering, a new generation of upgrades was introduced, the "solderless" memory upgrade board. The means of connecting these solderless boards to the ST are many, but all involve some method of pushing contacts down into sockets or onto the existing chips on the ST motherboard. Unfortunately, while it's easy to install these upgrades, none of them are fully reliable.

One solderless upgrade I've installed requires you to remove the Memory Management Unit (MMU), and push a little printed circuit board with pins sticking out the bottom into the empty MMU socket. Then the MMU chip itself goes into a socket on the new little PC board.

Another solderless upgrade leaves the MMU chip in its own original socket, but rams little pins down between the chip's legs and the socket contacts.

An upgrade like this could work just fine for months, then you might hit the Return key a little harder than usual, and pow..! Flexing the ST motherboard, moving the computer to play MidiMaze, or just thermal expansion may cause the little pins to loosen or make unreliable contact and there goes your data.

The solderless upgrade board I'd installed in my ST started giving me problems with intermittent crashes and data corruption, so I started looking for something more reliable.

Unfortunately, the popularity of the solderless upgrades had caused them to completely replace the earlier "solder in" so it looked as if I was going to have to put up with the crashes if I wanted more than 512K of memory.

I finally spottedwhat I wanted: a Canadian company called Datafree Industries was demonstrating their new 16MHz speedup board for the ST, but I was more interested in the memory expansion board next to it.

The board allows you to expand a 520 ST to 2.5 or 4 Megs, and best of all, it solders in place. I didn't have the money to get one at the show, but I did get a flyer with their address.

Several months later, Chaos Strikes Back came out for the ST, and I was lost deep in the Dungeon, when pow! Bombs across the screen.... I took out the old upgrade and ordered a Datafree board.

My first impression of the Datafree memory upgrade was disappointment. The board is *not* 100% "solder-in," but uses a combination of solder and plug-in connections.

With the Datafree board, you don't have to touch the MMU chip, as those connections are soldered to the back of the ST motherboard. The Shifter chip connection is exactly the same as my old memory upgrade though.

You remove the Shifter, push a small printed circuit board into the Shifter chip socket, then plug the Shifter into a socket on the small pc board. I decided to install the board anyway, as it looked better than what I'd been using.

Installation was quick and easy, even with the required soldering. What makes it so easy is the use of a small "template" printed circuit board that fits over the bottom of the MMU socket on the back side of the ST motherboard.

Once you get it properly oriented, it's very easy to solder it onto the MMU pins. I had to clip a few protruding ends of component leads to get the template close enough to the motherboard, but that really wasn't a problem. Once the template is soldered to the bottom, you just bring the ribbon cable attached to it around the front of the motherboard and plug it into the main board that holds the RAM chips. Another ribbon cable leads to the Shifter chip in the small metal RF shield box, where you pull the chip, plug in a small pc board, and plug the chip into the board. The RAM board sits on top of the motherboard in any convenient place.

The installation is actually a little more compact than the other upgrade I'd used, because there's nothing directly over the MMU chip, but it's still a pretty tight fit getting the shielding and case back on. You have to adjust the position of the RAM board to clear the mounting posts of the case, and to allow the keyboard to fit properly. I've never seen the actual size of a Turbo-16 or a PC Ditto II board, but I know I'd have a hard time fitting anything else into my ST!

One very important note from the instructions: If you have a newer ST with surface mounted components, this upgrade *will not fit*. Actually, I really don't think *any* upgrade that depends on connecting directly to chips on the motherboard will work with surface mounted chips. I don't know at what point Atari started using this mounting method, so if your ST is fairly new, it might be better to open it up and check it out before ordering any upgrade. If the chips on your motherboard look very flat, and appear to be "glued" onto the surface, with no pins protruding through to the bottom of the board, you have surface mounted chips.

Another important area the instructions cover (which the instructions for my other upgrade neglected to mention), is a slight modification that has to be done to the ST motherboard if you plan to install a full 4 megs of memory. Because of the design of the ST, only a maximum of 4 megs can be addressed. Therefore, the existing 512K of RAM on the motherboard must be disabled before the new RAM can be used. The modification is simple and puts the old RAM into a "standby" state to reduce the load on the power supply.

I didn't have to worry about this modification, as I'd only bought 2 megs worth of chips to install. The Datafree board comes without RAM, which allows you to find the best price you can in a very volatile market. The upgrade board costs $165.95 US, including shipping. The 16 1Megabit RAM chips added about $92, and by now that cost should have dropped as the price of RAM chips continues to drop.

Incidentally, there's sometimes a bit of confusion about what chips to buy. The upgrade boards that use individual RAM chips, like the Datafree 2/4 Megabyte Memory Upgrade, use standard 1Megabit x 1 RAM chips, 150ns. If you don't know what that means, don't panic. Just tell whoever you order the chips from and they'll know. You'll need 16 to add 2 megabytes and 32 to add 4 Megabytes of memory. RAM chips come in different "speeds," which refers to how quickly they respond to requests for data. Some computers need faster chips to keep up with the faster speed of the computer, and naturally the faster chips are more expensive.

With my new 2-1/2 meg upgrade installed, I can now run a 1/2 meg printer buffer at the same time as a 1meg RAMdisk, and still have a meg left for running programs. Best of all, I don't have to worry about disabling all but 512K to run Magic Sac or worry about whether the data in a RAMdisk will come out looking anything like the way it went in.

The system is still not 100% reliable though. It has its bad days, mainly due to the use of the "solderless" connection for the Shifter chip as far as I can tell, but overall it's far improved over any other upgrade I've seen. I recommend it very highly!

A HINT FOR MAC65 PROGRAMMERS

John McGowan

This text file may be reprinted as long as it is unmodified and credit is given to the author and the source. Copyright, November 1990 John McGowan

In the IOMAC.LIB file, it is mentioned (on page 86 of the manual for MAC/65) that PRINT to a forward reference is illegal.

This has nothing to do with a bug in MAC/65 but is based on the following fact.

It is true that OP codes which are forward referenced are always assembled (on pass one) as absolute (rather than zero page, which is why one must have any zero page equates defined before addressing them in OP codes). However, any label which is forward referenced is taken as zero, not for OP codes (which assume absolute) but for other operations... in particular for the .IF directive.

Thus:

```
     .OPT OBJ
     .ORG $6000
     .IF TEMP<128
     INC TEMP
     .BYTE "small value",0
     .ELSE
     INC TEMP
     .BYTE "large"
     .ENDIF
TEMP INC $6000
TEM1 INC $6001
TEM2 INC $6002
```

will generate a *phase error*, since on pass one, TEMP (as a forward reference, and so far undefined) is taken as zero.

Thus the first part of the .IF branch is taken (TEMP<128) though the INC TEMP *is* evaluated using absolute addressing.

Pass one is used to determine the values of TEMP, TEM1 and TEM2.

Then, on pass two, TEMP has been defined and the second pass is taken. *Phase error!*

There is a way to avoid this. Replace the

```
.IF TEMP<128
```

with

```
.IF [TEMP<128] .AND [TEMP>0]
```

to make an explicit determination for the first pass!

The @FL and PRINT macros in the IOMAC.LIB have embedded conditional assembly which is why the forward addressing fails in the example given on page 86.

To avoid this problem, one may modify all lines that test for strings with the code

```
.IF %1<256
```

to

```
.IF [%1<256] .AND [%1>0]
```

to allow forward referencing!

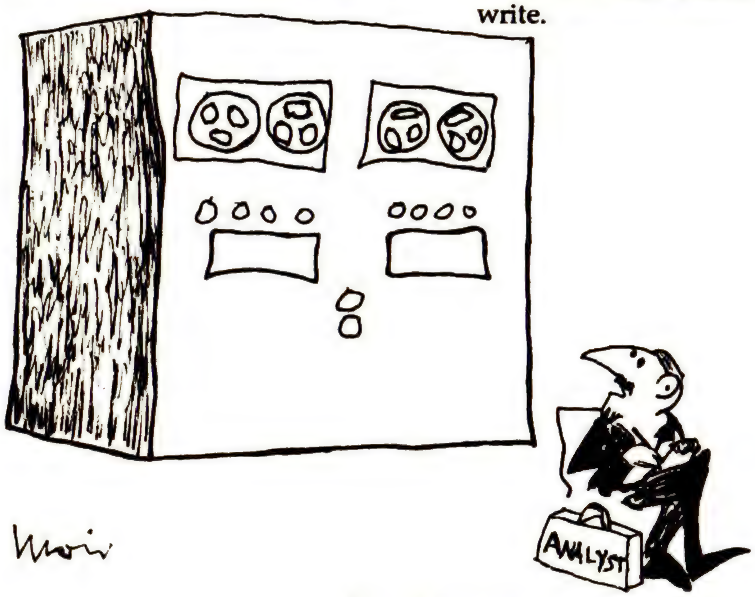
This is *not* a panacea for all conditional assembly, for it will fail on the @CV macro in the IOMAC.LIB.

For a string passed as the first parameter or for an address, %1 will not be zero...and will only have the value zero on the first pass (for which we may explicitly test).

The @CV macro, however, may load (explicitly) a value of zero. If you make the above change here, @CV ZERO (where ZERO is forward referenced to an equate of zero) will wind up doing a load from register zero, with a *phase error* due to a new reason.

The first pass uses a LDA absolute, but as ZERO is really in page zero, the second pass has a now-defined label in page zero and assembles as zero page addressing!

This is *not* a bug, but a problem with forward addressing in conditional assembly. The "fix" mentioned here *will* allow forward addressing of addresses for strings in the IOMAC.LIB and in macros you write.



"... and when did you start feeling threatened by mini-computers?"

Basically Speaking

Jeff Summers, ACORN

This month we will look at the usefulness of subroutines. Essentially, these are the segments of programs you see referenced by GOSUB statements in published programs.

The main purpose of a subroutine is to limit the amount of repetition in programming. This is the same reason loops were devised. The advantage of subroutines over loops is that the group of statements to be repeated may be called from anywhere in the program, thus the subroutine fills a different sort of need.

Let's take an example. For our program this month, we will draw three squares on the screen, changing the screen color each time a new square is drawn. First, let's list the steps involved:

1. Set up graphics mode
2. Draw first square
3. Change screen color
4. Get input from user (press RETURN)
5. Draw next square
6. Change screen color
7. Get input again
8. Draw final square
9. Change screen color
10. Get input from user
11. Return to text mode and end.

Now, step by step, here's a program that would accomplish our desired result:

```
10 DIM A$(1):GRAPHICS 8:COLOR 1
20 PLOT 10,10:DRAWTO 10,30:
   DRAWTO 30,30:DRAWTO 30,10:
   DRAWTO 10,10
30 SETCOLOR 2,0,0
40 INPUT A$
50 PLOT 20,20:DRAWTO 20,50:
   DRAWTO 50,50:DRAWTO 50,20:
   DRAWTO 20,20
60 SETCOLOR 2,10,4
70 INPUT A$
80 PLOT 40,40:DRAWTO 40,80:
   DRAWTO 80,80:DRAWTO 80,40:
   DRAWTO 40,40
90 SETCOLOR 2,4,6
100 INPUT A$
110 GRAPHICS 0:END
```

Okay, that doesn't look so bad. Each line does one step in the list of steps above. So, 11 steps, 11 lines of programming. The only way to do this, of course, was to make some lines compound, like the lines that actually draw the squares.

How would this look using a subroutine? The subroutine we will use will draw the squares. On entry to the subroutine, a few assumptions will be made:

1. Variable UL will contain the value for the upper and left borders.
2. Variable LR will contain the value for the lower and right borders.
3. The new color values will be in HUE and LUM.

Let's look at the new program:

```
10 GRAPHICS 8:DIM A$(1):
   SQUARE=200:COLOR 1
20 UL=10:LR=30:HUE=0:LUM=0:
   GOSUB SQUARE
30 UL=20:LR=50:HUE=10:LUM=4:
   GOSUB SQUARE
40 UL=40:LR=80:HUE=4:LUM=6:
   GOSUB SQUARE
50 GRAPHICS 0:END
200 REM SUBROUTINE TO DRAW
    SQUARE, CHANGE COLORS AND
    GET INPUT
210 PLOT UL,UL:DRAWTO UL,DL:
    DRAWTO DL,DL:DRAWTO DL,UL:
    DRAWTO UL,UL
220 SETCOLOR 2,HUE,LUM
230 INPUT A$
240 RETURN
```

I chose to name the subroutine for readability. ATARI Basic allows you to GOTO or GOSUB to a variable name—in this case "SQUARE," which held the first line number of the subroutine. The RETURN in line 240 lets the computer know this is the end of the routine and it should resume processing from where the GOSUB left off.

The important thing to note is that although there were differing sets of data, the part of the program where the square is drawn needed to be written only once, a big time and space saver.

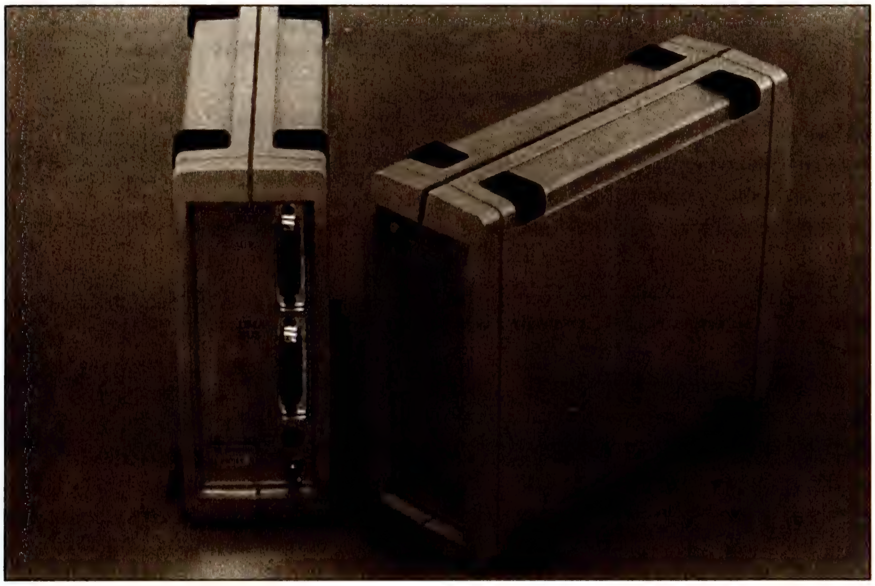
SUPERCHARGER V1.4

BREAKS THROUGH THE BARRIER

Full MS-DOS Compatability With Real Time Multi-Tasking Plus **EXPANDABILITY**



NO INTERNAL
MODIFICATIONS
REQUIRED

PLUGS DIRECTLY INTO THE
DMA PORT OF YOUR
COMPUTER

MS-DOS INCLUDED

- RUNS CGA AND HERCULES
- EQUIPPED WITH 1 MEG RAM
- USES EXISTING MOUSE AS DOS MOUSE
- SUPPORTS 5.25" OR 3.5" AS SECOND DRIVE
- PRINTS TO THE ATARI LASER FROM DOS
- SUPPORTS ALL HARD DISKS WITH AHDI DRIVER
- SUPPORTS ALL PARALLEL PRINTERS
- USES ST SERIAL PORT UP TO 9600 BAUD
- ATARI 3.5" DISK READS/WRITES AS 720K DOS
- SOCKET FOR 8087-2 CO-PROCESSOR
- USES SUPERCHARGER'S RAM AS 1 MEG RAM DISK
- USES ST'S RAM AS RAM DISK IN DOS
- RUNS 286 AND 3.0 WINDOWS
- BUILT IN BUS FOR FUTURE EXPANSION
- SEPERATE 5V DC SUPPLY
- INSTALLATION MANUAL
- 12 MONTH WARRANTY
- SHIELDED ABS CASE (FCC CLASS A CERT.)
- ONLY 6.25 X 7.25 X 2.25 IN.

SUPERCHARGER OPTIONS SOON TO BE RELEASED

SCplus/NET - Full networking board
- Connect DOS and TOS programs or files under Novell™ etc.
- Transfer rates of 2.5 Mbits/sec.
- Plugs into existing expansion connector with no soldering required.

SCplus/286 - Turns SuperCharger into a full 286 co-computer
- Runs at 12 MHz on a pure AT chip set
- Comes with 1 Meg of RAM expandable to 4 Meg - full EMS support
- Contains true AT expasnsion slots - accepts ANY expansion card
- Provision for an 80286 co-processor
- Plugs into existing V30 socket with no soldering required.

SCplus/386 - Turns SuperCharger into a full 386 co-computer
- Runs at 16 MHz on a pure 386 chip set
- Comes with 1 Meg of RAM expandable to 4 Meg - full EMS support
- Contains true expasnsion slots - accepts ANY expansion card
- Provision for an 80386 co-processor
- Plugs into existing V30 socket with no soldering required.

TRUE MULTI -TASKING

Connect several superchargers together to run different programs concurrently

HOT KEY

Allows TOS/DOS switching without rebooting.

TOOLBOX

Programming interface to allow programmers to develop their own background tasks.

LAUNCHER

Execute DOS programs directly from your TOS window.

SuperCharger - Only

$450

V1.4 Upgrade Kit - $19.95

dBMAN TipSTer #4

Mousing Your Way Around in Programs

Peter Killian (OACES)

This is the first of what I hope will be many articles on some of the ST specifics of dBMAN. One of the best features of dBMAN for STers is the ease with which you can program some mouse functions like pull-down menus and selecting from a list of features.

Normally dBMAN does not feature much mousability. It is not a GEM-driven program with its own menus, being primarily based on a program that predates even IBM and compatible machines—where mice were not only absent, but unheard of.

Mouse features do show up, though, with some of the add-on features, such as the report writer and assistant. The assistant is especially GEM-like, with most actions selectable *only* with the mouse from pull-down menus like you would see on the desktop.

These menus are not quite as comfortable as those you would probably find in other, more standard GEM programs, since they often switch back from mouse to keyboard after you choose the main action from the mouse menu. Also, there is no usage of graphic objects, icons, dialog or alert boxes (though these can be partly simulated).

Despite the limitations, I find the ease with which I can create pull-down and other simple mouse menus refreshing.

There are three basic functions in dBMAN programming to ask for a mouse-driven choice: PMENU(), MMENU() and SELFILE(). You will, of course, have to use other commands/functions as well to actually get results from the choice, but these are the building blocks we will start with.

And by the way, for those who might not have already guessed, I have been using the term "pull-down" menus because dBMAN calls them that and named the function PMENU() based on that name.

This is primarily a throw-back to the IBM world where menus do *not* "drop down" automatically when you run the mouse past them. Instead you have to press and hold a mouse button or some key from the keyboard to see what is on any of the menus.

Now, some of you may be wondering why we would even want to use the mouse with a system that was not generally designed for it. Well, even those who are mouse-phobic generally warm up to the little rodent when used consistently (unlike the aforementioned add-ons to dBMAN).

Also, with a little bit of creativeness, you can have other normally computer-phobic people (maybe even your spouse!) using this sophisticated and powerful system without even knowing it! Besides, I found I often wanted to get to a desk accessory without leaving dBMAN, but I didn't want to have to use one of those monster add-on programs.

Here is a simple program that does nothing more than allow that and also lets you return to the dBMAN interpreter or the desktop at the touch of a button:

```
* Accessory access
SET DEFAULT SYSTEM TO D:\dBMAN\
SET DEFAULT TO
SET DB3 ON
vtitle = " FILE "
viteml = " RETURN to dBMAN Interpreter | OPEN Database | QUIT
to Desktop "
vdel   = "|"
DO WHILE .T.
   CLEAR
   @  3, 3 SAY " COPYRIGHT 1990"
   @  3,57 SAY " by Peter R. Killian"
   @  2, 1 TO  4,78
   @  6, 3 SAY "ACCESSORIES"
   @  7, 3 SAY "  at your  "
   @  8, 3 SAY "  command  "
   @  6,67 SAY " Use MOUSE "
   @  7,67 SAY "    to     "
   @  8,67 SAY "  select   "
   @  5, 1 TO 9,15
   @  5,66 TO 9,78
   ASSIGN PMENU('|', vtitle, viteml)
      DO CASE
      CASE PMENU() = 1
         DO CASE
         CASE VMENU() = 1           && Exit to dBMAN interpreter
            CLEAR
            ? "RETURNING . . ."
            EXIT
         CASE VMENU() = 2          && QUIT to desktop
            QUIT
         OTHERWISE
            CLEAR
            @ 10, 0 SAY CENTER("ILLEGAL entry from MENU 1!",80)
            ASSIGN MMENU(12,37,1,4,1,vdel," OK")
         ENDCASE
      ENDCASE
   ENDDO
   SET DEFAULT SYSTEM TO D:\dBMAN\
   RETURN
```

Notice in addition to the "pull-down" menu, I also used a more common mouse menu with MMENU. The way I used it, you get something like an alert box that has no frame, except for around the single allowed response. The mouse pointer will appear as soon as either the PMENU() or MMENU() functions are invoked and will disappear as soon as you select an option with the mouse. It does not stay gone with this program unless you choose one of the exits, of course, since I have the program reexecute the PMENU() function until you do choose one of the exits.

Notice how the parameters for PMENU() are nothing more than strings that are already defined. The variable 'vdel' is short for vertical delimiter, since it is the character I have used to separate vertical elements in the menu. I could have used basically any other character to separate the two possible choices, but I used the vertical bar since it is easier to see and I am a little bit used to it from other languages.

The variable 'vtitle' contains the heading for each pull-down menu, while 'vitem1' contains the choices available when you pull down the first (and in this case only) menu from the menu bar. These variable names are not magical and you can substitute other names in your own programs.

Notice that I use the PMENU() function *without* any parameters to determine which menu was pulled down and VMENU() for the specific numbered item within that pull down. This is the reason I used DO CASE as a conditional instead of IF...ENDIF. CASE makes it easier to add either more menus and/or more entries for each later (which I have in fact done on the examples which should be available on the AIM disk).

Now, for the MMENU() function, you have a few numbers along with our previously defined delimiter and the list of items to select from. In this example there is only one choice, so the list is included verbatim, but, most of the time, you will use a variable that actually holds the list as we did for PMENU(). The numbers are used to locate the menu on the screen and tell your ST just how much space to allow for the menu on the screen.

You need five numbers for this function: two to define the upper left corner for the list (text row and column), two to say how much room to allow vertically and horizontally for each item in the list, and finally one to define how many columns to allow. In our example, I allowed four spaces for the one and only item, with one row per item, and only one column allowed.

By the way, the MMENU() function is *not* a standard function for all machines you can use dBMAN with; it is specific to the ST. Nor is the final function I want to discuss listed in the standard manual. It is also not listed in the ST-specific supplemental manual! I found out about it from previous versions and examples VersaSoft provided on disk when I upgraded.

That last mouse-driven command is SELFILE() which calls the standard file selector (or custom one like Universal Item Selector, etc. if you have one loaded). Like the previous two functions, this one takes some parameters and is invoked with the ASSIGN command. It departs from the other two after that, however.

First, you don't have to specify a delimiter since you don't pass it any list(s) to choose from. Rather you specify some characteristics you want in the list that GEMDOS will provide. This time there is some "magic" to the words used in the call. This time you have to place quotation marks around what are actually variable names. Also, because of the way that GEMDOS returns the answers, you should be sure there is extra room in both variables for longer path/file names. To my knowledge, this is the *only* place that dBMAN requires this unusual arrangement. The call looks like this:

```
ASSIGN SELFILE("path","file")
```

After selecting a file, the filename will be in the variable 'file', while 'path' will contain the path name, which does *not* necessarily include a drive letter if it wasn't specified beforehand and/or changed in making the selection.

Until next time, keep on enjoying exploring dB-MAN for yourself and pass on 'goodies' you find as well. As always, you can contact me by writing to AIM, O-ACES, or leave E-MAIL on GEnie (P.Killian).

Hard Driven Bargains!

TOAD Drives

TOAD 20 MB 40ms	$479
TOAD 30 MB 40ms	$499
TOAD 50 MB 40ms	$575

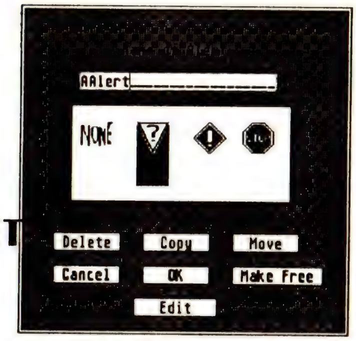
WERCS
A Complete GEM
Resource Construction Set



Earl Hill (SAGE)

We have all seen those files that go along with program files, such as WW2.RSC, the resource file for Word Writer 2.0. Sometimes, RSC files also go with ACCessory or APPlication files. Resource files are special files that contain resources (what else?). WERCS is a utility to make these files.

A resource file is used by the GEM AES (Applications Environment Services) to produce Menus, Dialog and Alert Boxes, Icons, and Strings.

They are particularly handy since they can be used unchanged in all resolutions and can be used with different programs or revisions without requiring major modification—a great time saver. Furthermore, using an RSC file is easier than manual programming, but it also produces smaller files and makes code easier to maintain. It also lends itself to structured programming.

Resource files are best created with programs called Resource Construction Sets (RCS). With these tools, programmers don't even have to write the code which creates menus and places icons. These features are designed with the construction set and the mouse. To a degree, you don't even have to be a programmer. All of this is done by a process called form handling.

What's Available?

Although the software available for the Atari ST is becoming quite advanced, there is a deficiency in RCS programs comparable in sophistication to those available for the Macintosh. For Atari, the RCS programs available are from Atari (DRI), Kuma (from England), Megamax and HiSoft. Unless you own the Atari Developer's Kit, your alternate choices are the latter ones listed.

However, there is a problem with all of these except HiSoft, in that none of them can be purchased other than as part of a language package. HiSoft WERCS, written by Dave Nutkins using FTL Modula-2, brought to us by way of MichTron, is a full-featured, powerful RCS for the rest of us.

It WERCS!

WERCS enables you to produce programs to take full advantage of GEM. WERCS is a mouse-driven RCS which permits you to easily create Dialog Boxes, Menus, Icons, and Alert Boxes. With WERCS, you can adjust size, position, border width, color and fill patterns of boxes quickly and easily. You can change the size, justification and color of text characters. Text fields are totally editable.

You can produce and edit resource files up to 64K in size. You can produce resource files for use in low, medium, and high resolution. You can have up to 16 characters per language identifier. There's an optional automatic naming feature (no need to type text and name twice).

A unique Search facility allows you to search for a particular string or language identifier within your resource file. Full cut and paste editing of objects and whole trees is supported, as well as optional character snap and text box string. There's an integrated icon editor to design your own icons. The list of features goes on and on!

Documentation and Use

WERCS comes on a single sided disk containing the resource editor; several utility files to do tasks such as importing Degas files; plus example RSC files. It runs in all screen resolutions.

The manual begins with a discussion of WERCS resource file content (tree types and tree structures). WERCS trees are of five different types: Form (Dialog Boxes), Menu, Free String, Alert or Free Image. Of these, Forms and Menus are the most common.

Each type of tree consists of objects. You can actually have as many as 200 objects per tree. "Forms" are GEM AES object trees. An object tree is like an array of records, with each record describing an object. The objects are numerically indexed.

For example, a Dialog Box with a message, two radio buttons, and an "OK" button would be six objects altogether. Each of these is described in the terminology of human family trees—parents, children, etc.

In WERCS, there are thirteen types of objects that you can have in object trees. Most of these are some form of text or boxes or both; hopefully, no monkeys in the family tree!

WERCS does nearly all of the hard work of constructing one of these resource files for you. It keeps track of tree structure, object states (e.g., the type of box), object positions, flags, etc. All of this is under GEM and conveniently mouse driven, with selections made from the drop-down menus. WERCS also creates the all-important header files. These headers provide the means for programs or accessories to "call" resource files, which is why you can't change the RSC name.

Header files differ depending on the programming language chosen. Resource files must match the language used to write the program, accessory or application file. The programming language for which the RSC file is intended is selected prior to actually creating the resource file. WERCS offers a choice of C, Pascal, Modula-2, Fortran, Assembler and BASIC.

The manual itself is written from two aspects, depending on the experience level of the user. It leads the "beginner" programmer through all the steps necessary to construct RSC files, proceeding from the simple to the complex. For the "expert" or professional programmer mode, it gives an in-depth discussion of the practical aspects of using WERCS. After an introductory discussion, you are walked through the use of WERCS in creating and editing trees and the handling of object levels. After becomming familiar with Dialog Boxes and Menus, you graduate to more complex trees such as Free Strings.

The remainder of the manual goes into fine details of objects, flags, programming with resources, hints and tips on resources, compiling, the use of the utility programs, and keyboard shortcuts. It also contains helpful summary tables and example programs.

The manual itself is very well done although a little brief considering the power of WERCS and and the complexity of programming resource files. It is filled with hints and cautions, both about the use of WERCS, problems with GEM and bugs in TOS. Considering the intricacy of the subject, it is very clear and informative. There is also a lot of useful general information, much of it not readily available, about GEM objects and their attributes. For the non-expert, there is a display of empathy in the explanations not ordinarily found in manuals. Commendably, the manual also has an excellent index.

In Conclusion

If you do not already have an RCS editor and want to include resource files in your programming, WERCS will do it for you. As far as RCS utilities go, it may be the only game in town, but it is a good one. WERCS represents both good value for the money and a way to get things done.

It does require some knowledge of GEM programming, and for the novice who wants to delve deeply into RSC files requires a somewhat steep learning curve, but it is a necessity for those who do not have a stand-alone RCS program.

P.F.M PLUS

PERSONAL FINANCE MANAGER

If you run a personal bank account and have an ATARI ST then you need "PFM PLUS."

AS EASY TO USE AS A CALCULATOR
If you need to amend or update an entry simply click on it. Your screen looks just like a bank statement. PFM PLUS handles Credit and Debit - Weekly, Monthly, Quarterly, Yearly and even complicated regular payments.

BUDGET WITH EASE, AT A CLICK OF A MOUSE
If you're the type that likes to look ahead the PFM allows you to set budgets for both expenditure and income. Up to 28 budgets can be set over a year, a quarter or a month and then displayed either in figures or as a bar graph for a given period. Income/Expenditure for these budgets can also be shown as a pie chart so you can tell at a glance where your money's gone.

REPLAY VIII

SOUND SAMPLER

ST REPLAY has always been the leading sampling system for the ATARI ST range of computers. Now REPLAY has come of age! The ST REPLAY cartridge has been producing the cleanest, sharpest sounding samples since it was first released, ST FORMAT magazine said, "REPLAY is a winner." Now REPLAY has the most advanced sound editor of any low cost sampling system on any computer, ANYWHERE. REPLAY 8 not only has the largest range of sample editing facilities available anywhere, it also features many advanced software functions which, if they are available at all, must be purchased separately at EXTRA cost on lesser systems.

REPLAY 8	$ 169.95
REPLAY Professional 12 bit digitizing version	$ 249.95
QUARTET Midi Music Synthesizer	$ 59.95
MASTERSOUND II Budget sound sampler	$ 79.95

HiSoft BASIC Professional

HiSoft BASICProfessional is a fully integrated compiler and editor that takes BASIC programs and turns them into speedy, compact, 68000 machine code, giving you stand-alone ready-to-run programs. HiSoft BasicProfessional is a superset of the already famous HiSoft Basic, and has the extra features that put it even more in a class of its own.

HiSoft BASIC PROFESSIONAL	$ 159.95
HiSoft Basic	$ 49.95
HiSoft DevPac	$ 99.95

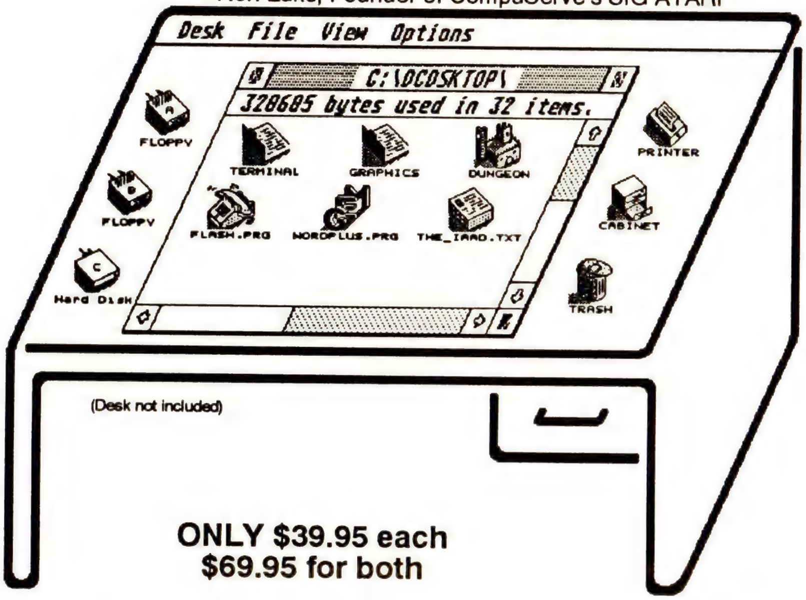
DC DESKTOP

New Programs and Features

ONE LOW PRICE!

"The GEM Desktop just got better"

"DC Desktop is a permanent part of my system."
–Ron Luks, Founder of CompuServe's SIG ATARI



(Desk not included)

ONLY $39.95 each
$69.95 for both

Enhance, don't replace!

- Place programs & **folders** right on the desktop
- Display unique file, folder and drive icons
- Color icons
- Store frequently used files and programs in our exclusive CABINET virtual disk drive
- Display NEOchrome, Degas, TINY,Spectrum, ART director and Mac pictures from SHOW
- View files at the desktop with an enhanced SHOW routine (with mouse control!)
- Replace the desktop with a pattern or picture
- Recover files from the trash
- Spool/queue printing from desktop or program
- Works in all resolutions, STE and TT too!
- Drop down menu commands via keystrokes
- Load different desktops with a keystroke
- Comes with a command line interface, bootup selector, terminal, icon editor, more
- Special hooks let RAM resident programs be called with one key from DC Desktop
- Completely modular and memory resident – only use what you want!

The Kraft Tripletrack Trackball
for the Atari ST

Tim Holt (ACCEPT)

I have been frustrated for a long time at all the nifty things available for the ST in Europe, such as IBM style cases made just for the ST, etc.

One of the more nagging longings I have had was to get a trackball for my ST. Ever since I saw them down at Jenkins'for the IBMs and in all those slick European magazines for the ST, I have been on the lookout.

Well, I don't have to look any longer, because Kraft Systems has very quietly come out with "Tripletrack" an extremely nice replacement for the standard ST mouse. For those of you with limited desk space, or who are like me and drag the mouse all over creation, the Tripletrack is a godsend.

The Tripletrack comes in a light grey color and is loaded with features you won't find in any mouse I've seen for the ST. The entire unit is smaller than the mousepad I had been using. Three buttons instead of the normal two are located below the trackball instead of above. The trackball and the buttons are a slightly darker grey than the rest of the box. Here is a list of features I think you will find very impressive.

The Tripletrack is designed to work with all Atari ST series computers. This includes the STe. Tripletrack also works with (get this) the Atari 400-1200 series, the Amiga and Commodore 64/128 computers. Maybe the name should be the Quadruple Track.

A small switch on the right side of the box sets which type of computer the trackball will use. As mentioned before, the Tripletrack has three buttons instead of two. Two outside buttons function like the right-hand mouse button on a regular mouse. This is very nice for us lefties.

The box itself is less than two inches tall, six inches long and four inches wide. The ball is about two inches in diameter and is placed in the center of a three tier box.

The top tier has two special function keys, the middle tier contains the track ball, and the bottom tier, the one closest to you, holds the three mouse buttons. Kraft calls this "ergonomically designed." I guess that is the trackball equivalent of Farfegnugen.

Joystick Emulation

The Tripletrack can be used like a joystick! This is what separates this trackball from a regular run-of-the- mill mouse. No more need for another set of wires hanging out of your ST. All you have to do is select position 3 on the computer select switch, and you have a joystick instead of a mouse.

In this mode, the left and right buttons act as fire buttons, and the middle button is disabled. (Again, a nice benefit for the left-handed in the crowd.) And you do not have to turn off your computer to switch modes!

While in joystick emulation, the other function key, (mode key) can be set for Autofire, so that when you fire your gun or whatever, you *really* fire! The Autofire allows automatic continuous firing. You do not have to hold a button down or repeatedly press a button to get a burst of fire that should wipe out even the evilest of enemies.

When you are not in joystick emulation, just switch the mode switch to 'D.' This allows the mouse to drag items, just like normal.

The locking button allows you to lock on a drag, and the drag stays on as long as the button is depressed. In Joystick mode, this button allows for continuous autofire. To deactivate the continuous autofire or drag, just depress the button. Now you have single shot activated. Either way, this is an excellent option.

Optional Footpedal

The Tripletrack has an optional footpedal that performs the same functions as the right and left mouse keys. The footpedal plugs into the top side of the Tripletrack and allows for some interesting control of programs. Feet and hands! (This option does *not* come with the Tripletrack, but can be purchased separately.)

You probably are asking yourself how well the darn thing works. Well, I like it! I must admit, using a regular mouse for four years has gotten my hand used to using my index finger to do all the work.

With the Tripletrack however, the design makes use of your index, middle and fourth digits to move the trackball. Your thumb and little finger are the ones that depress the buttons. This feels a little clunky at first, simply because you are used to doing something else. However with a little practice (about a half hour), you will feel just fine about the digit switch.

The cursor movement is exceptionally smooth and with the various mouse accelerators around, the darn thing literally flies across the screen. Response is the best I have *ever* seen. And I have gone through my fair share of mice (mouses?) in my years of ST computing.

Why buy the Kraft Tripletrack? While the Atari mouse is functional, it doesn't look nice. Tripletrack looks a lot better than the Atari mouse. The options mentioned previously make this an excellent buy, and Kraft has included a nice cloth cover with the Tripletrack to keep the dust and dog hairs out while you aren't using it. Even the cover matches your ST's color!

Kraft includes a *five year warranty!* That's a pretty long time, and, if you think about it, that warranty will probably outlast your computer.

One last thought: For whatever reason, Kraft does not appear to be actively advertising this excellent product in the Atari arena. For this reason, your dealer may not know about the Tripletrack as a product for the ST. Let them know! And if you purchase this product, make sure you send the registration card and let Kraft know you are an ST user.

The Kraft Tripletrack trackball for the Atari ST is a definite *must have* for any serious ST user!

The ATARI XL/XE Commercial Software Drought is OVER !!!

SOFTWARE INFINITY proudly presents its Brand NEW *KE-SOFT Series* -- the First Major ATARI XL/XE Commercial GAME Releases to be produced for the North American market since 1987 !! Eleven spellbinding super-sophisticated 1991 GAMES on 9 economically-priced premium quality Disks ! Already Bestsellers in Europe -- newly enhanced to revitalize your XL/XE !

Every GAME in *SI's KE-SOFT* line boasts ultra-realistic & colorful state of the art high-resolution animated graphics, outstanding music, and lots of clever surprises. Many also feature digitized speech & sound effects, high-score saves, a password system to skip levels, and a capable Editor to near-effortlessly create your own new screens. Handsome and comprehensively detailed printed Instruction Manuals are written in clear, easily understandable English. All 11 superior 64K *KE-SOFT* titles are endlessly entertaining to novice and experienced ATARI GAMErs alike.

$10.50 GAMES
2 or more for $9.50 each !

ZADOR

Turn over all 144 Chinese-symbol tiles on the game board by matching singles to make pairs that are solely connectible by an invisible line (which can't cross any active tiles or be bent more than twice)! A high-powered Mah-Jong variant with 20 levels and useful "prompt next pair" option.

DRAG

Guide intrepid Drag the Frog past deadly mines, exploding bombs, & falling rocks in a treacherous underground lair, to collect diamonds before his air runs out! 50 screens of Boulderdash-type arcade action.

SOGON

Navigate your sturdy forklift around the 50 barrier-filled floors of a skyscraper to relocate large boxes one at a time to waiting storage bays. Once you've moved a box to any perimeter-wall or partition, you can't pull it back! Devious chess-like strategy; vital backup-one-move function.

ZEBU-LAND

Help Zebu engineer the escape of his 3 brothers from a 50-level labyrinthine world of revolving doors and blocked passageways (move wall-segments aside to reveal exits)!

DREDIS

At last -- the unparalleled mind-boggling Commercial ATARI XL/XE version of the arcade champ Tetris! Ultra-challenging puzzle, multiple levels of difficulty, one- and 2 - player modes.

Order 3 or more *KE-SOFT* GAME titles Mixed ($14.50 & $10.50 items together) -- subtract $1.50 from the price of each !

BACKUP COPY of any GAME Disk is $2.00 if purchased at same time as Original; $ 4.00 if ordered later.
Great *KE-SOFT* GAMES *DEMO DISK* with playable sample screens -- FREE with any 2 GAME Disks, or $4.00 separately.

SHIPPING And HANDLING is always just $3.00, regardless of quantity of *KE-SOFT* products ordered.
NO State Sales Tax is due on any SI Disk.

$14.50 GAMES
2 or more for $12.50 each !

TECHNO NINJA

Voyage to a hostile alien world to reclaim your home planet's ultimate source of power! Encounter 10 perilous landscapes (cities, bodies of water, spaceships, etc.) on 100 screens. Gain energy, earn up to 8 extra weapons, battle over 50 varieties of monsters. Enhanced density disk.

CULTIVATION / CHROMATICS

Two brain-busting puzzlers on one disk!
CULTIVATION: Put away your Farmer's Almanac -- this game's about the strategic "cultivation" of matching symbol-blocks; push together like singles in the proper order to make pairs and clear your choice of100 screens on 10 levels.
CHROMATICS: This mesmerizing 3-level Tetris-style contest utilizes 3 - 5 different colors instead of shapes; rotate the hues of blocks falling into a well to place 3 or more same-colored blocks together at the bottom.

OBLITROID

As the last Star Warrior of Xyros, you must track the evil Tindalos to his underground dungeon and engage in mortal combat! Find special weaponry to survive never-before-seen dangers on 4 Worlds comprising 140 screens; invaluable stop/continue mode. Extensive Manual is packed full of maps & tips. Enhanced density disk.

TOBOT / BROS

Two invigorating arcade adventures for the price of one!
TOBOT: Using his versatile laser gun, our robot superhero must escape a spooky 50-room castle filled with angry spiders!
BROS (Super Mario Brothers - inspired): Traverse 8 Worlds with 4 Underworlds each to rescue your brother from a hidden castle -- collect mushrooms to get power or shots, gather coins to earn additional lives, and vanquish legions of monsters!

Vampire's Empire

A Bloodsucking Good Story

Gordon Totty (MACE)

Dr. Van Helsing's mother was likely not a virgin. Of course, if he was adopted, we might have to reexamine this assumption.

What this tells us is that the vampires in Vampire's Empire from DigiTek, Inc. differ from the vampires in Andy Warhol's Dracula. In the latter, the vampire required the blood of a virgin (or, if you saw the flick, "wirgin"). It may also tell us that Warhol didn't know squat about vampires.

Van Helsing, who was born in 1680, had his life changed forever one memorable night in February, 1693.

This is the night he awoke at about 2 am and found a vampire sucking blood out of his mother's throat. No mention is made of Van Helsing's father. Either he was snoring, deceased or living somewhere else. In any event, it was the young Van Helsing, a mere 13-years-old, who had to try to help dear old leaking Mom. He failed.

He devoted the rest of his life to the study of vampires and a quest for the destruction of the nasty suckers. He became a vampirologist. He probably knew far more about the breed than dandy Andy ever did or imagined he did.

He was probably also one badly screwed up dude. Dr. Freud, who was born long after Van Helsing's demise, taught us a few things about how this experience might have affected a teen-aged boy.

Goodness only knows what Van Helsing did in the privacy of motel rooms! This being a family magazine, I will not speculate on the lurid details, but you may stop reading for awhile and speculate in detail.

Van Helsing was also a prolific writer of prose and verse. The following poem is reproduced from inside the folder this game comes in. DigiTek describes it as his "Plea to the Light" and states that it came from the inside cover of his journal, circa 1753. None of his writings past the year 1753, the year of his 73rd birthday, survive today.

The Light is my help and salvation/ Whom shall I fear?/ The Light is the strength of my life/ Of whom shall I be afraid?

When mine enemies and my foes,/ Came upon me to eat my old flesh,/ Came upon me to devour my soul (but not my garlic)/ They stumbled and fell.

Unto thee, O Force of Light, do I lift up my soul/ I trust in thee, let me not be discouraged,/ let not mine horrible enemies triumph over me/ and teach me the way, show me the path.

For in time of trouble it will be my shield/ and when I walk through his evil Lair, I will fear no one, for the Force of the Light/ and the stench of my garlic protect me.

I put all my trust/ in the Force of Light and its Power/ to defend all that is good in the world/ to destroy the Price (sic) of Darkness.

Yea hear my praise, my crying/ Hear my glorious honor and singing and/ protect me from the mad ONE that hath horns and hoofs/ and free me of my arthritis.

Modern scholars believe that Van Helsing may have been the first to discover that poetry need not rhyme, that blank verse is art, too. Philosophers have noted the heavy religious influence on his poetry, and wonder why it is, with all the references to light, that water is not also mentioned. Both philosophers and poets have been stumped by the reference to the "Price" of darkness.

The above poem gives you almost all of the direction you are going to get before you assume the persona of Van Helsing, a funny looking little guy, and embark upon solving the dilemmas of the Vampire's Empire.

The physical aspects of the empire are a series of stairs and platforms which you descend in your search. The documentation is scanty, and if I were not a lazy typist I could probably reproduce the other half of it in about two columns—maybe one, with small print!

The documentation consists of one 8-1/2 x 11 inch page, printed on both sides, and folded twice so that it makes eight tiny pages. Its main content is three entries from Van Helsing's Journal, one each from 1693, 1744 and 1753.

The last two pages describe your main tools: mirrors, garlic, and a magic ball. Nothing is mentioned about a wooden stake or a pistol loaded with silver bullets.

You are handicapped in your search, the object of which is to find and kill the main non-man himself, Count Dracula, king of the hickey (hickey if you are from the Northeast, love suck if you are from the Southwest)!

The Van Helsing figure is a cute little old man, gnome-like with a large head and small body. His nose is considerably bigger than mine, a comfort to me in this cruel world of small-nosed people. (Just how do you all get enough air through those things? Don't you feel like you are suffocating?) He shuffles about noisily, and slides to a stop when you bid him to do so with your joystick, unless he is on a slippery surface.

You will be entertained in your journey by music. It is good music, but it repeats over and over and can become annoying on a long search. Of course, you can turn the sound down.

The artwork, or graphics, in this game is exceptional. There are a series of beautiful platforms, stairs, and columns furnished with trunks, candles, oil lamps, and strange stuff like eyes that pop open at odd moments. Two Amiga screens are reproduced on the folder. They appeared to me to be accurate representations of the Atari screens as well. Cute mice abound. Please don't kick them.

Frequently you will see glowing gold, with red, brown and blue accents. An hourglass on the left functions, but its meaning was not plain to me. Repeatedly, it finished draining, only to begin again.

On the right is a long, vertical, red bar. Again, meaning unknown to me, though I guess it to be a life-line. When gnomes or gargoyles "spit" (drip moisture) on Van Helsing, this bar shortens. When Van Helsing "picks up" a golden lamp, this bar lengthens. None of this is explained in the documentation. You figure it out for yourself.

The Van Helsing figure is unhurt by falls. Push the stick up and he stands up again, ready to resume the quest. This, plus the cuteness of Van Helsing, the "monsters," other human figures and the mice (or rats), belies the "frightening atmosphere" promised on the box. I never found the Count, but expect him to be cute, too.

The search aspects of this game can be overpowering. It uses high resolution and smooth scrolling for its good artwork. It is easy on the eyes, and ears for as long as you enjoy the music. But it promises 240 different screens, and my children and I never even saw the bloody Count in our efforts to date.

Children that I have exposed to this game, two of mine and two playmates for a total of four aged 8 to 11, have been delighted with it. As usual with me, the 11-year-old boys taught me a thing or two about it that I hadn't discovered. I think that if I could line up a 13-year-old researcher we could whiz through these challenges. Well, I'm nurturing one myself; wait two more years.

You will learn this game as you might once have learned to swim: dive in, and do it. There are not even any title screens, menus or credits to delay your plunge. When Vampire's Empire finishes booting, you are confronted with the first screen. Go to it.

Another poet, not Van Helsing, once said something like, "When into life as into lakes we dive, we are lucky to come up alive." If your experience with Vampire's Empire parallels mine, you'll come up alive. Not because you are careful, but because you'll have a hard time finding the trouble you are looking for.

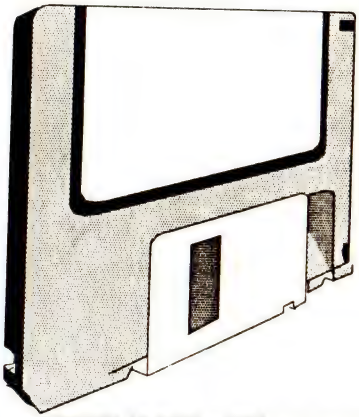
To join CompuServe or for more information, call (800) 848-8199. In Ohio and Canada, call (614) 457-0802. If you're already a member, type **GO ATARI** at any ! prompt.

AIM Disk of the Month
February 1991



All files on this disk are self-extracting LZH archives created with Double Click's Self-Extracting ARC program, DC SEA! To use these programs, simply double click the files. Then, click on Extract and select the drive/folder to which you want the extracted files saved. Click on Verbose to get a list of the files in each archive or Exit to abort.

Here's a short description of the files on the February '91 disk. For more complete documentation, see the text files contained in most of these archives.

✓**BUTTNFIX.APP**—Fixes problem of double mouse clicks when you only click once in TOS 1.4 or above. Desk accessory from Charles F. Johnson based on an idea by Gene Sothan.

✓**CAL32.APP**—Calendar 3.2. See any month, any year from 1 to 9999. Attach 'events' to days by date or by position in month. Display events for the day, browse through events, find a specific event and more. Runs as a PRG or ACC on any ST/TT in any rez. Includes CalShow to display upcoming events when you boot up.

CHECKING.APP—Excellent, highly efficient checkbook program. Maintains a Payee and Memo list, along with ability to edit checks and produce reports.

✓**COLORQLT.APP**—Simple game to help teach color matching to young children. Low rez color.

DBLPAGE3.APP—Print up to 4 pages on a single sheet of paper with an SLM804/SLM605 laser printer! Custom fonts, custom defaults, and command line support.

DBMAN_4.APP—CMD files accompanying dBMAN TipSTer #4 by Pete Gilliam.

DCFLIGHT.APP—Freeware from Double Click Software! Turns on floppy light to show access of RAMdisks, etc. Only uses 392 bytes. ST/STe/TT compatible

DCLEFTY.APP—Switchs eft and right mouse buttons. Great for left-handers or if your left mouse button is wearing out. Freeware from Double Click Software.

✓**ENCRYPT.APP**—Encrypt or decrypt ANY type of file on the ST. You specify the key and the program does the rest.

FLMPLAY.APP—Plays animations in Lexicor Software's FLM format. Just select the name of the FLM file you want to play. Opening dialog box shows all keyboard commands available in the player. Written by David Ramsden and Paul Dana. Watch for some great animations on upcoming disks.

✓**GLEE130.APP**—Graphic Library Editor 1.30. Load Deluxe Paint ST or CAD3D animations, IFF Degas or NeoChrome graphics and save them as C or GFA source code!

✓**ICON_90A.APP**—Collection of 100 icons for NeoDesk 3. Icons for Quick ST, Double Click Utilities, Spectre, SuperBase, Turbo ST, Tempus and more.

✓**KV_FONIC.APP**—This program introduces children to phonics. It includes 9 puzzles containing consonants (b, c, d...), blends (sl, sn, sm...) and digraphs (th, sh...). Educational software from Knowledge Vine. Low rez color.

LIBMASTR.APP—Shareware utility to organize, modify, convert and print your Print Master Libraries.

PNTVIEW.APP—Viewer for pics created with Lexicor Software's Prism Paint. Written by Robert M. Birmingham.

✓**ROBIN.APP**—Control Mother Robin to catch flies and gather her children from various nests. Avoid hazards such as candle flames and spiders. Designed by Juergen Reichen-wallner from Germany. Color only.

SEQ2FLM.APP—TTP program that converts Cyber Paint SEQ files to Lexicor Software's FLM format. FLM is a new compressed animation format that results in smaller files, and faster playback speeds. Enter the name of the SEQ you want to convert and the name for the new FLM file, separated by a space. Example: OLD.SEQ NEW.FLM Written by David Ramsden.

✓**TPN2_114.APP**—Taipan II version 1.14. GEM version of a classic trading game. See how long you can stay in business trading goods from New York to Rio in the 1800s. Best played in low rez.

UNSIT.APP—Extracts files from Macintosh Stuffit (.SIT) archives. Runs under TOS—no emulator is needed! Even works with ARCSHELL.

✓**WHATIS41.APP**—Recognizes 71 types of files: ARCs, LHarcs, PRGs, pics, ACCs, animations, etc...no more "what kind of file is this?" problems! Runs as a PRG or an ACC on any ST/TT in any rez. This version adds PKZIP, more Neo, Deluxe Paint ST and Prism-Paint files to the list.

YAHTZEE.APP—Yahtzee 2.0 is a slightly enhanced upgrade of Yahtzee 1.0 converted from Atari XL BASIC to GFA Basic by Y. Wolf in 1987. All prompts changed from keyboard to mouse. An excellent 1-6 player game that faithfully recreates the classic game Triple Yachtzee. GFA source included. Medium rez color.

✓**ZX81.APP**—Timex/Sinclair ZX81 emulator for users who can't get enough of the ST's emulation capabilities. Includes many ZX81 programs including an assembler and an integer basic compiler.

Readers can purchase this disk from their local AIM Participating user group or by sending $6 ($5+ $1 S/H) to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108.

Please specify the February '91 disk when ordering.

Introducing New Products:

Silhouette Graphics Auto-Tracing for the Atari ST

Load, modify or create raster graphics images and auto-trace them into GEM vector graphics. Auto-tracing features: 1) straight line identification, 2) curve smoothing, 3) curve fitting, and more. Open IMG, Degas and MacPaint file formats. Save raster graphics in IMG format. Drawing features include polygons, stars(3-99 pts./sides), parabolas, spirals, bsplineand multiple pt. bezier smoothing. Contour data files or screen areas; similar to altitude contours of a topo map. 1 Mb required.

Exposé A Desk Accessory for ST Desktop Publishers and Graphic Artists

View and clip out graphic files from Expose' GEM window, capture screens. Simple drawing pen and eraser included. Load, edit ascii files into the notepad and send notepad text directly into the main program from the desk accessory. Access the Atari ST extended ASCII character set. Show disk free space, system memory and view and edit system time and date. Load and view Degas, Degas compressed, Tiny, Neochrome, IMG, GEM metafiles and MacPaint files. Converts low and medium resolution to high resolution. Comes with special reference files (*.IMG) for Symbols, Dingbat character to keyboard configurations, and font family displays.

Also From Maxwell:

Fractal Fantasy ~ 2D/3D Mandelbrot Fractals, Degas Formats.
Megstenders ~ Megas ST keyboard extension cords(6,8,12,25').

New Product Release

ST/MEGA Compatible Mouse

Features:

- Opto-Mechanical Design for Maximum User Sensitivity
- Ergonomical Design For Optimum User Comfort
- High Resolution Photo tracking of 200 Pulses per inch
- Replaceable Teflon wear pads (feet)
- Teflon rollers on the steel photo optic interrupter shafts for maximum smooth operation and ease of maintenance/cleaning
- FCC certified to comply within the limits for a Class B computing device
- Full ST/MEGA owner support with replacement parts
- Compatible with 8-bit GEM operating systems
- Model CBM1 Mouse - Suggested retail of $49.95

Now you have a second choice for mice you can use on your Atari ST/Mega* computer system! You will find because of its unique shape The Best Mouse can be used for many hours of uninterrupted computing work with little or no fatigue. Most Atari owners who have used The Best Mouse agree, they would not switch back. See your local Atari dealer for your free TEST RIDE of this new premium mouse today or contact:

AAAUA ATARI 8-BIT USER GROUP

Alamo Area Atari User Association (AAAUA),P.O. Box 79-1426, San Antonio, TX 78279-1426

The AAAUA is an Atari 8-bit user group serving the greater San Antonio area. General meetings are held on the first Tuesday of each month at the Balcones Heights Community Center, 107 Glenarm, San Antonio, Texas, from 6:30 to 9:30 PM. General meetings feature a presentation and small group problem solving. Each third meeting we have a swap meet and computer workshop.

Members receive a subscription to AIM as part of their benefits. Dues for regular family membership are $24 per year or $15 for six months. Dues for "Subscribing" membership has been increased to $15 per year domestic and $18 per year for most foreign countries due to increased costs. Subscribing members receive a subscription to AIM and (FR)ANTIC, and have access to our P.D. Library. For further information, call Al at (512) 492-6633.

President	Alvan Sherrill
Vice-President	Billy Washburn

Treasurer	Joe Barth
Public Relations Officer	Bruce Davisson
Librarian	Russell Gibson
Newletter Editor	Manuel Garcia

Presidential Ponderings by Alvan Sherrill

The big news this month is the AAAUA Christmas Party held Saturday December 15th at the Oaks of Marymont Apartments. We are grateful to the management for permitting us to use their absolutely beautiful facilities and to Peggy Blank of AAAUA for making the necessary arrangements.

Members started to arrive at 6:30 PM just as the last of four computers were set up and the decorations were completed. Party Chairperson Thelma Sunvison, assisted by Jannet Blocker, in charge of food, and her group of helpers had prepared an abundant feast to please a king.

At about eight PM the Super PacMan contest began. Out of eighteen participants, Adam Weissmuller took the first prize of a Super PacMan cartridge; Don Rogers and Chris Cassiday took the second and third prizes, respectively, each an Atari Joystick. Following this, the first four issues of ANTIC magazine donated by Floyd Blunk, owner of Atari-ville, our local Atari store, were auctioned off. These four priceless and historic bits of nostalgia all received the high bid from Dr. Malcolm Orr, a long time Atarian and loyal member of AAAUA. At the conclusion of the auction, Dr. Orr donated the magazines back to the user group for the hard copy library. Such generosity is rare, indeed! Thank you, Dr. Orr.

After the auction, Santa Floyd Blunk presented an Acey Deucey disk, by Softsmith, to each member present, followed by Santa John Hardie who gave each member a PD disk which our Librarian, Russell Gibson, had painstaking assembled. John Hardie is past Vice-President of AAAUA and flew in from New York just for this occasion.

Next on the agenda was a raffle where everybody won! Nineteen of the lesser prizes of a miniature computer clock and an Atari bumper sticker, were awarded, followed by a repair kit, a circuit board clock, a 300 baud modem, a 1200 baud modem, an Atari 810 disk drive and an Atari 800. The Grand Prize, donated by John Hardie, was a real arcade GYRUSS game console. This was won, appropriately, by RUSSell Gibson. I don't think he could have been happier if he had won the Irish Sweepstakes!

In the awards ceremony, Thelma Sunvison, Jannet Blocker and Rose Marie Pettit all received the AAAUA One Dollar Award for outstanding and dedicated service. The Atarian of the Year award went to Gino Giammalvo, past newsletter editor. Gino did not receive the award just for his outstanding work as newsletter editor, but for his too numerous to mention contributions made to the user group over the past year.

Thank you, for all of us.

ABLE

The Atari Boosters League East (ABLE) meets monthly with enthusiasts and provides user support for all Atari computers except the Portfolio and PC line. The purpose of ABLE is to advance the knowledge of the membership through mutual education and the interchange of ideas.

General meetings are held in the Palm Magnolia Room at the Orlando Public Library, 101 East Central Blvd., on the last Sunday of each month from 1:30 to 4:30 P.M. ST SIG special interest meetings take place in Room 134 at the Bush Science Center on the Rollins College campus on the second Wednesday of each month from 7 to 9:30 P.M. Ad hoc meetings are scheduled as needed to present speakers, conduct special workshops, provide tutorial seminars and for parties. We assist members in service and software problems, as well as arrange group purchases and discounts.

Information is disseminated to members through our newsletter, the ABLE Atari Information Digest (ABLE AID). A package of twelve selected previous issues of ABLE AID higlighting the "super eight" computers is available for $10 ($5 for members). In 1990, ABLE began participating in the Atari Interface Magazine.

ABLE accepts written correspondence at P.O. Box 1172, Winter Park, FL 32790, while membership inquiries are handled by Hadley Nelson, President, (407) 671-0317 or Milton Eager, Treasurer, (407) 834-0581. Annual dues are $12.

We have also established an ABLE Program Library of User Software (ABLE PLUS), consisting of several thousand files for the super eight and sweet sixteen computers. This library contains public domain programs contributed by ABLE members, as well as other computer clubs and users, to allow the sharing of user-written software. A computer specific listing is available to non-members for $3 and disks are available to non-members for $6 each.

Atari Club of Denver minutes December 4, 1990

Guy started the meeting off by showing a telephone dialer program that he wrote. The program uses a modem to dial a number that is typed into the computer. Larry then showed us the highlights of the latest version of his disk labeler program. He recently made some minor changes that make the program easier to use.

Election of new officers was next on the agenda. Larry was nominated for president and accepted. With a unanimous vote, Larry will be the president for 1991. Joe said that he would continue as Executive Director and Guy said that he would continue as Treasurer unless some else wanted those positions. No one spoke up, so Joe and Guy will continue in their respective positions. Paul also was willing to continue as club librarian. We should all thank these people for their efforts to keep the club going.

After the elections, Guy showed how to use the Desktop interface on the ST. Since most of the members only have 8-bits, this gave them a chance to see something a little different for a change.

StarFleet Meeting Minutes by Thomas Oughton

December 14, 1990 -- The meeting started with a total of 7 members present. Anyone who wants to attend our meeting, we now meet at Pomona High school in Arvada, Colorado. Mike bought a 20 meg. hard drive for the the Atari Clubs of Denver's Bulletin board. This along with a backup power supply he created, should make the board reliable. The phone number for the board is (303) 343-2956.

Other news discussed is that Diamond developer Alan Reeve is thinking of publishing a magazine. It will contain about 50% Diamond articles, and 50% other 8 bit articles. We discussed the idea of having less demonstrations, and spending more time answering questions. But, we need a larger turn out for that. Beginning users, COME TO THE MEETINGS, we would like to help.

The first demonstration was of a program written by our president Chris Guenther. This program he wrote for his mother allows a diabetic to record blood sugar levels, and insulin amounts. These values can be printed in either a bar graph form or a normal print out. This should help the doctor and patient control the illness. This program written in BASIC is available in the clubs library.

With Christmas upon us, the next demonstration was of the Christmas and New Year related programs in the club's library.

Mapware was the next program demonstrated. This oldie allows the 8 bit Atari to create detailed maps of portions of the world. It does not have all the country boundaries for all countries though. It will produce maps of four different projections; Cylindrical, Azimuthal Equidistant, Orthographic Equatorial, and Perspective. The Cylindrical is the fastest to generate, and the the one people will use the most. Perspective is what the Earth looks like from an altitude entered. This program is written in BASIC and will run under Turbo BASIC which speed things up a lot. Using Turbo BASIC, it took about 12 minutes to create a perspective map. These maps can be saved to disk, and using a print program like Trent Dudley's Superb Screen Dump be printed on paper.

The Atari Club of Denver is going to catalog all the disks in their library. To speed up the job, one of their members wrote a program in Action! to catalog disks. This program is very easy to use. This product is very nice and after the demonstration we received, I hope it will soon be in the Starfleet library. The Meeting broke up at 10:05.

ACCT

Atari Computer Club of Toledo club members receive, as part of their dues, Atari Interface magazine and access to the 8bit and ST public domain software libraries. Disks are $2/8bit and $4/ST. Non-members may purchase disks at a slightly higher cost.

ACCT meets on the second Monday of the month, from 7-9 pm at Bassett's Health Foods, 3301 W. Central Ave (Westgate Shopping Center), Toledo, OH. ST Sig held monthly at the home of David and Brenda Micka. Dates and times announced at meeting. ACCT may be contacted at 4487 289th, Toledo, OH 42611 or by calling Dave Micka at (419) 729-1891 or Michael Justice at (419) 242-7797.

ACCEPT
Atari Computer Club of El Paso, Texas

ACCEPT (Atari Computer Club of El Paso Texas) ACCEPT is the only Atari club in the entire El Paso southwest. Membership to ACCEPT is $20 a year. A membership in ACCEPT will get you the magazine your holding for an entire year, discounts at Jenkins' Computers and on various ST publications. Technical help, and access to one of the largest PD libraries in the US are also thrown in for good measure. Special access to the STE-EP BBS, an ACCEPT members BBS is also a privilege of membership. Make checks payable to: ACCEPT 10953 Yogi Berra El Paso, Texas 79934

BBS support for ACCEPT: STEP El Paso: 915-755-STEP STE-EP BBS El Paso: 915-821-9220

ACCEPT executive committee Steve Bruck, Tim Holt, L.R.'Pete' Rosh, Dave Davis

From the President, If you missed the December meeting of the club, you missed quite a bit. Here is a rundown:

The club now has a new name! members voted to change the club name from the ST Club to ACCEPT. ACCEPT stands for Atari Computer Club of El Paso Texas. This name is more encompassing than the name ST Club and should help to draw new members, those that may be familiar with the MS Dos and Mac formats that many of our club members are using. Some of us are using MAC and IBM almost exclusively on our Atari's. Because of that, we will be adding more MS- DOS and Mac stuff into our library.

Dave Davis has a tentative list of the library. 56 pages of arc'ed, lzh'ed, tos'ed, and apt'ed files. This represents a much larger library than we had previously, so if you see our former librarian, let him know how much we don't miss him. Dave is doing a GREAT job! Thanks again Dave!

The club will be getting some free copies of the magazine Atari ST Journal. You have to come to the meetings though, to get the magazine.

The auction was a great success! 21 items were auctioned off, for a grand total of $254.35. Here are SOME of the deals that were made: A BEST mouse went for $20. The excellent game Resolution 101, $12. A hardly ever used version of Wordperfect $75! We had $40 an $50 games going home with new happy owners for less than $10! You can't get those kind of deals through the mail! (And there are STILL folks out there that won't join our club! Go figure.)

Club member Bill Marquis won the Atari Lynx that we raffled off for Christmas. Congrats to Bill, and thanks to all of you that helped sell and buy tickets. We made a few dollars on the raffle, and we certainly didn't lose any money, which was my only real concern.

The Kraft Tripletrack trackball for the ST was the demo by myself, and Steve Bruck demoed how to install Neodesk after most everyone else left.

I want to take this opportunity to wish all the club members and thier families a wonderful new year. You know, we have anifty little computer, and even though our numbers grow smaller and smaller each year, you folks have continued to help ACCEPT prosper and grow. We now have members in Canada, Mexico, and in 12 of the 50 states. That is due to your help, your confidence and support that what we are doing each month is a help to you. I would personally like to thank those members that have hung on for a long time with us: Paul, Dave, Pete, James, Suzy, Tom, Mark, Steve and any others I may have left off. To you new members, Wendell, and Joe, you are the hope for our club in the future. I thank you all!

Have a Happy New Year!

ACORN

Atari Computer Owners of Rochester New York

The Atari Computer Owners of Rochester, NY (ACORN) meets on the 2nd Wednesday of each month at Brighton High School, based in room 262S. Before each meeting, a STarter class for the ST meets at 6:45 pm and a Basically Speaking class for the 8-bit starts at 7:00 pm.

ACORN operates a BBS at (716)436-3078 with 52 megs of public domain downloads for the 8-bit and ST systems. Our mailing address is POB 23676, Rochester, NY 14692. Dues are $18 per year which includes access to the club's PD libraries, enhanced access to our BBS, and subscriptions to our newsletter, the ACORN Kernel and to Atari Interface Magazine.

President	Don Allis	(716) 293-3415
Executive VP	Albert Yarusso	(716) 244-4487
8-BIT VP	Nick Cup	(716) 266-1648

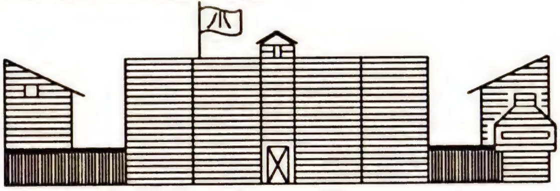
ST co-VP	Robert Costello	(716) 244-4487
Secretary	Chris Freemesser	(716) 328-1703
Treasurer	Vinnie Indovina	(716) 594-9731
Basic. Speak. Class	Jeff Summers	(716) 342-7632
STarter ST Class	Stu Woodard	(716) 352-4937
Kernel Editors	Candi & Bruce Nelson	(716) 334-5513
8-Bit Librarian	Nick Cup	(716) 266-1468
ST Librarian	Joe DePierro	(716) 223-7838
Ex. Newsletters	Helen Kiker	(716) 924-4809

December Hi-Lites At the December meeting, Kernel Editor Candi Nelson demonstrated PageStream and how the ACORN Kernel is put together. Bruce Nelson showed a videotape of his visit to San Jose Computer and talked about his visit to Atari HQ.

The January 9th meeting will be our annual "disk swap". ACORN members may purchase copies of any of our ST or 8-bit p/d library disks for only $1.00.

The ACORN BBS is available to all Atari users. The number is (716) 436-3078 at 3/12/2400 bps.



ATARI COMPUTER OWNERS RESOURCE NETWORK
FORT WAYNE, INDIANA

ACORN, the Fort Wayne area Atari users group, meets at the Georgetown branch of the Allen County Public Library on the first Saturday of each month beginning on at 10 AM. Annual membership dues are $18. Call our BBS at (219) 744-1396 for more information or write to us at ACORN c/o Ken Helms, 3627 Iowa Court, Fort Wayne, IN 46815.

CALENDAR: Tentative schedule for the demonstrations at the monthly meetings are: February, Computer Utilities; March, Business Software; April, Programming Languages; May, Music; June, Telecommunications; July, Three Rivers Festival

Meeting Notes: Kevin Van Zuilen, president of the local chapter of the IEEE, has expressed an interest in affiliating his organization with ACORN in order to gain a node on the national BBS network. The IEEE will pay the added cost of the long distance calls. The officers are working out the details of the affiliation. Scott Schaffer demonstrated Micro Illustrator on the XL/XE. Scott Sorg demonstrated Degas on the ST.

The February meeting will not be at the usual time and place. The library is conducting personnel training and the officers are investigating alternative times and places.

ATARI FEDERATION

Regular meetings are held at the VAFB Federal Credit Union, Vandenberg Village, Califorina on the first Monday of every month at 7:00 P.M. Dues are $10 for individual or $15 for family membership. The Atari Federation maintains a PD software library for both 8-bit and ST computers.

Atari Federation, P.O. Box 5367, Vandenberg AFB, CA 93437

Secretary's report: December's meeting was pretty quick. We elected new officers, or should I say our old officers were renewed for another year. So Phil Rominger is the President, Bob Ribortone is the V.P., Matt Matias is the Secretary, Herb Kanner is the Treasurer, and Chester Hadly is the 8-bit Librarian. Two new officers are: Al Hanson is now the Newsletter coordinator and Dan Liston is now the 16-bit Librarian.

Besides the elections, several gifts were given to members as door prizes. To top-off the evening, this was the club's Holiday Pot-Luck. If you missed this meeting, you missed some good eating.

Seasons Greetings.

Birmingham Atari Computer Enthusiasts

The Birmingham Atari Computer Enthusiasts of Birmingham, Alabama meets at the Vestavia Hills Library downstairs at 7:00 p.m. the second Monday of each month. Membership dues are $20 for a regular membership,and $35 for a professional level membership.

Mark Bodenhausen	President
James Gilreath	Vice President
Brenda Bodenhausen	Secretary
Steve Yates	Treasurer

For membership information, contact Steve Yates, 1005 Candy Mountain Road, Birmingham, Alabama 35216.

Our BBS is at (205) 833-5012. This is both a voice and data line. To access the BBS, press 1 after the first ring. For voice, press 2. After 6 rings, 2 is automatically selected.

BRAG ST

Buffalo Region Atari Group for ST's

BRAG ST was founded in 1987 to serve Atari ST owners in the Western New York area. General Membership Meetings are held on the third Thursday of the month at Erie Community College North Campus, Room S-105 in the Student Center. Setup begins at 7:00 PM; Meeting starts 7:30 PM. The Board of Directors meet on the the first Tuesday of the month at the Your Host Restaurant, Harlem at Sheridan at 7:30 PM. All are welcome to attend. Piracy will not be tolerated at any BRAG ST function.

BRAG ST, PO Box 1035, Buffalo, New York, 14225

Chairman	Mark Pierro	(716) 691-7844
Vice Chairman	Ken Malark	(716) 683-1272
Finances	Gerry Genson	(716) 877-1328
Records	Joe Rogozinski	(716) 877-8378
Disk Librarian	Carl Barron	(716) 885-4325
Public Relations	Harvel Hontz	(716) 689-8074
Graphics	Dick Kersting	(716) 839-0494

November 15, 1990 BRAG ST General Meeting

Club Business: AIM- A vote was taken in regard to the "Editorial Ramblings" article on page 6 of the November AIM. The results of the vote were to "keep the price, size and quality the same, but move to second class mailing".

Board of Directors Elections - The following members were re-elected to the Board of Directors: Mark Pierro, Gerry Genson and Joe Rogozinski; also elected as a new Board member was Dane Stegman.

TV/Monitor - Mark Pierro reported the results of the Committee which went to Stereo Advantage and inquired about a 20 inch TV/Monitor for the club. The choices were between a Samsung ($249) and JVC ($350). The membership voted to purchase the Samsung.

Club BBS - The membership was reminded that the Club BBS, "BackScatter", phone number is 684-3978 and the access code is 'boast' (no quotes) for message area 69 and file areas 61, 62 and 63.

Demonstrations: Dick Kersting did a great job in demonstrating his MiGraph Hand Scanner. Several members brought pictures for Dick to "scan" in for future manipulation and/or storage.

At the break we raffled off Vegas Craps (won by Bert Royce) and LDW Basic (won by Bill Schmitt).

Bert Royce got the demonstrations going again with a MIDI demo. He showed various techniques that professional musicians use to help create and edit music. The last demonstration was on ST Aladdin by Carl Barron. Using this program helps you navigate GEnie, simplfy tasks, minimize time online and therefore saves you money! This program looks like it will become as popular with ST users as it is with the IBM users.

The meeting adjourned at 10 PM.

B.R.A.C.E.

Bluegrass Region Atari Computer Enthusiasts

B.R.A.C.E. (Bluegrass Region Atari Computer Enthusiasts) meets the third Sunday of each month from 1 - 4 PM. Current membership dues are $15 per year for an individual membership, $20 per year for a family membership and $10 per year for an associate membership. (An associate membership includes receiving the monthly newsletter, but excludes the use of the library.) Members of have extra privileges on The Abyss BBS (606) 223-2782.

President	Hal Nason	(606) 269-8989
Vice President	Greg Parsons	
Secretary	Chris Dotson	

CDACE

Capital District ATARI Computer Enthusiasts

The Capital District Atari Computer Enthusiasts was founded in 1981, is located in Albany, N.Y. and serves Albany, Schenectady, Rensselaer, Saratoga and surrounding counties in upstate New York. XL/XE meetings are currently held on the third Wednesday of the month and ST meetings on the last Wednesday of the month. CDACE meetings are held at the Computer Cellar, located in Westgate Plaza, Albany, New York.

The club has extensive public domain libraries for both computers which are available to members beginning at 6:30 PM on meeting nights. ST-based disks are priced at $2 while the XE-based library continues to remain free to all members.

Dues are currently $20 per year for each family. This includes a subscription to AIM magazine, full access to the club BBS, and our monthly newsletter. The club actively promotes the use of all Atari computers through demonstration and application and welcomes non-members and share ideas.

President	Bob Thompson	518-439-5356

CACE

Cascades Atari Computer Enthusiasts

Cascades Atari Computer Enthusiasts is the Atari Club in and around Jackson, MI. The CACE BBS is run by the club and open to everyone. The number to call is (517) 764-4047. Current membership dues are $14.80. Any written communication with CACE should be sent to PO Box 6161, Jackson, MI 49204. Our meetings are held on the second Saturday of the month fro 1p.m. to approx. 4p.m. at the Boos Recreational Center. For more information, contact Brent Fisher at (517) 764-4599.

Central Oregon Atari Club, PO Box 6824, Bend, OR 97708

Membership dues are $1/month and $1/year for each additional family member. We meet every second Saturday of the month at 5:00 PM at the Ann Rita Conference Center, which lies just in front of the St. Charles Hospital on Neff Road in Bend.

CUSTUG

Champaign-Urbana ST Users Group

The Champaign-Urbana ST Users Group (CUSTUG) meets at 7pm on the second Wednesday of each month in the Auditorium of the Urbana Free Library at the corner of Elm and Race in Urbana, IL. Membership dues include a subscription to AIM and GLITCH and use of the commercial lending library. New members are welcome. The group supports a local BBS, Blackhawk's Keep, operating 24 hours a day at 3/12/2400 baud (1/8/N): 217-892-5512.

Henry Murphy	President
Jimmie Myers	Vice President
Jim Linder	Secretary/Treasurer
Tim Brumleve	Librarian

CRAG Calumet Region Atari Group

CRAG Calumet Region Atari Group PO Box 10995 Merrillville, IN 46411-0995 CRAG, is a club for users of the Atari ST, STE and MEGA ST computers. CRAG meetings are held on the second Wednesday of every month at Broadway Music, which is located in Greentree Plaza, at 1509 West 81st. Ave(U.S. 30), Merrillville, Indiana. Meetings begin at 7pm.

Membership in CRAG is open to anyone. Dues are $15.00 a year and entitle you to a subscription to Atari Interface Magazine, as well as discounted prices on CRAG's Public Domain/ShareWare Library disks. Library disks are double sided. Cost per disk is $2.50 for members $4 for non-members. For more information call:

Jeff Coe (219) 663-5117 Randy Noak (219) 663-6912

President's Ramblings by Jeff Coe

Well, this is my first column to be printed in AIM. Due to my own uncertainty concerning lead times, I won't be passing along any time critical information this month. As I write this we have a few days yet before the CRAG Christmas party. I hope we had fun!

For January, we'll be giving away the ST SOUND SAMPLER that was donated to us by Datel Electronics. Come on out and throw your name into the hat for the drawing. I don't have the program topic worked out yet for this month, so I guess you'll just have to take your chances and see what we can come with. I promise that we'll have something to keep your interest.

It's also a bit early to give much information about the monthly Library disk. It'll either be a disk full of those fantastic Knowledge Vine childrens programs or a new Utility disk. We've been collecting some very nice software lately, plus starting this month we should be getting some help by way of AIM's Disk of the Month club. Which brings up a topic we need to think about. Do you, the members of CRAG, want us to make these disks from AIM available to you exactly as they come in? Or, should we pick and choose the programs we want from each disk and try to incorporate them into theme disks the way we have been? It's a decision that I think needs to be voted on since we're all paying for the disks.

I need to pass along a bit more information here. If you write articles for inclusion into AIM (please do!!), you need to get them submitted to an officer of CRAG by the 12th of the month. That way we can get everything collected and submitted to AIM in time to meet their deadlines.

Finally, you may have noticed that we haven't got a nice logo at the top of our section like the other clubs have. How about a contest? Get out your graphics software and see what you can come up with. The only requirement is that your design must be in black and white, so it can be used as clip-art. The higher the resolution the better. The entry voted best will appear at the top of this column every month, and the artist will receive a free disk from the PD/ShareWare Library. (OK, so it's not the greatest prize in the world, but what do want from me??)See you all at the meeting.

Eastside Atari Users Group

The Eastside Atari User Group, (EAUG), meets on the first Monday of every month, 7PM, at the Alton Square Mall Community Room, in Alton II. All meetings are open to the public. No club dues. PD library, club newsletter EAUG-Log, newsletter membership $18 per year. Member group of the Midwest Atari Regional Council, MARC.

Club BBS's: Eastside BBS 618-254-6077 and Garage BBS 618-344-8466. EAUG's address is 2425 Crislisa Dr, Alton, II. Call 618-465-0342 for EAUG information.

FACCS

First Atari Computer Club of Spokane

We currently own and maintain a 24-hour Bulletin Board System (BBS), open to everyone with a 300, 1200, or 2400 baud modem, called the Atari Zone 509-326- 5741.

Since we currently have renewal dates scattered throughout the year, please check your card for your current expiration date. Remember, once your membership expires we are no longer able to send your AIM Newsletter or allow you to remain at the F.A.C.C.S. level on the Atari Zone. To prevent interruption in your F.A.C.C.S. services please renew by the expiration date on your card.

G.T.A.U.G.

The Newsletter of the Golden Triangle Atarian

The GTAUG has been 'around' since 1981 and supports both the 8-bit and 16-bit communities. Meetings are held the first Tuesday of each month at a location announced in the previous meeting.

At present our dues are $24 per year (Our year begins in September.) and is pro-rated at $2 per month for new members the first year. Since our nearest dealer is 90+ miles away, it is imperative that we support each other. It is for this very reason our group is a fairly close and diverse. We support all facets of Atari computing from 8-bit to Spectre/Mac to IBM and MIDI.

GRASS

GRAND
RAPIDS
ATARI
SYSTEMS
SUPPORTERS

GRASS meets the first Wednesday of every month at the Wyoming Public Library, 3350 Michael S.W.. Doors open at 6:30, meeting starts at 7:00pm. Dues are $22.00/yr. including AIM. Bring in one PD software disk and get 2 blank disks for your time.

JACS

Jersey Atari Computer Society, P.O. Box 710, Clementon, New Jersey 08021. JACS BBS: (609) 346-1224

The Jersey Atari Computer Society (JACS) provides a forum through which members may further their understanding and enjoyment of all Atari computers, through the exchange of ideas and information with other users.

JACS holds two meetings per month at the Camden County Library, across from the Echelon Mall in Voorhees, New Jersey. The executive meeting, where all the planning for the club takes place, is held in the 2nd floor meeting room from 7-9 PM (meeting dates vary from month to month). The regular JACS meeting is usually held on the third Tuesday of each month, in the 3rd floor meeting room from 7-9 PM.

President	Mike Hopkins	227-9058
ST Vice President	Maureen Kelly	428-9381
Treasurer	Forrest Blood	877-3579
Recording Sec'y	Gary Mickus	767-1933
Membership Chair	Al Guretse	596-7567

The regular monthly meeting includes topics of interest for users of all Atari 8-bit (400/800 & XL/XE) and 16(ST/Mega) computers.

Layton ACE of Utah

The Layton Atari Computer Enthusiasts (L.A.C.E.) membership cost $20 per year. Privileges include the AIM Monthly Magazine, access to the 8-Bit and ST club libraries, monthly meetings, help and friendship. If you are presently not a LACE Club member and wish to join contact the one of following persons or write to LACE, c/o Irwin Brooks, 3897 So. 2275 W., Roy, UT 84067-3515.

Irwin Brooks,	President/ST Librarian	(801)731-1516
Richard Clark,	Vice President	(801)825-5823
Ken Karchner,	Secretary/Treasurer	(801)776-8015
Lonnie Allen,	8-Bit Librarian	(801)392-4450
Kelly Knecht	ST Librarian	(801)773-5652

The L.A.C.E. Club Meets in the basement of the Clearfield Library every second Wednesday of the month at 7:00 p.m.

Mark your calendars for the next meeting: December 12, 1990.

LBACE

The Long Beach Atari Computer Enthusiasts meet on the second Sunday of the month at 6:00 pm. Meetings are held at Mercury Savings and Loan on the corner of Long Beach Blvd. and Carson in Long Beach. Address is PO Box 92812, Long Beach, CA 90809.

President	Richard Hull	(213) 422-1055
Vice-president	John Saunders	863-2582
Treasurer	Pat Connelly	
LBACE BBS		498-8824

Club dues are $20 annually. The club supports both the 8bit and ST. Members have access to the club's PD library and BBS and receive a year's subscription to Atari Interface Magazine.

M.A.C.E.

The Michigan Atari Computer Enthusiasts

Members of MACE receive, as part of their dues, Atari Interface Magazine. Members are also entitled to purchase disks from the 8-Bit and ST public domain software libraries. 8-Bit disks are $3 each, and ST disks are $4 each. As an added bonus, if you purchase three (3) disks from either library you will receive a fourth disk of your choice at absolutely no cost. Non-Members may purchase disks at a slightly higher rate. Mail order is also available.

For a catalog of current disks in our libraries, send $2 to:
MACE, P.O. Box 2785, Southfield, MI 48037

MACE meetings are held on the Third Tuesday of each month at the Southfield Civic Center at 7:30pm. The Southfield Civic Center is located at 10 1/2 Mile and Evergreen Rd, one half mile south of the Evergreen exit on the new I-696.

Meetings are in the small pavilion, room 115. Parking is available in the parking garage below the pavilion or in one of the many parking lots on the Civic Center grounds.

If you have any problems with getting to the MACE meetings, please feel free to call on a MACE Officer to relieve you of your confusion. We are always glad to extend a helping hand!

Please come and join us! We are awaiting your visit!

MID-OHIO ATARI USER GROUP

The Mid-Ohio Atari User's Group (MAUG) is again without a place to meet. If you know of any apropriate place which is available, please contact Chuck Steinman as soon as possible.

MAUG membership dues are $8.50 per year for residents of Ohio, and $12.50 for non-residents. Included with membership is a subscription to the Atari Interface Magazine (AIM) at no extra charge. ST users may elect to also receive the AIM ST Disk of the Month, for a total fee of $20 per year ($30/year for non-Ohio residents).

Please make payments out to Chuck Steinman/Maug, and mail them to Post Office Box 134, Ontario, OH, 44862. Payment must be received by the 10th of the month preceding publication, to assure receipt of that month's magazine. Please notice your membership expiration date is is printed on your address label, and renew at least 30 days in advance of that date to assure uninterrupted service.

Middle Georgia Atari Users Group

M.G.A.U.G.

The Middle GA Atari Users Group is the sole Atari Club in the Middle Georgia area. We are composed of 60 members of which approx. half are ST users. Club president Pete Miller can be reached by phone at 912-328-8758. The MGAUG address is 115 Feagin Mill Rd., Warner Robins, GA 31088. MGAUG meets the second Sunday of each month at 1 PM at the Warner Robins Library. Annual dues are $5 with the newsletter optional. Use of the club library is free to all paid members.

The December meeting was a little scarce again this year as it has been in years past. Most of the discussion in the meeting centered around the new Mega ST and its enhancements. The club has an offer from the makers of Word Flair for a discount on the purchase of their word processor. Just send them a disk from Word Writer ST, 1st Word Plus or Word Up and you can purchase the latest version of Word Flair for only $75.

In related sales offers to the club. Practical Solutions which in the past has allowed the club to try some of their fine products has a BIG sale on their Tweety Board. For a mere $14.95 plus shipping you can get stereo effects out of you ST.

Lee Mavity has been nice enough to bring some of his latest issues of European magazines to the meeting for everyone to see. For the ST gamer this is the only way to see some of the great games that are available. Speaking of great games - for you WWII buffs WolfPack is comming out for the ST. WolfPack is a submarine simulation that looks great, Computer Gaming World readers gave it very high marks.

The AIM disk was not available yet this month but I am looking forward to seeing it soon. Be sure to bring your blank disk to the next meeting. Pattie at Unicorn Publishing has assured me that our issues will be coming a little more on time in the future.

If you are using our local IBM bulletin boards ST area then be sure to note that it may go down if you don't act. If you enjoy using the board then be sure to send the SYSOP at least $10 to cover his phone bills for the next year. If he does not get enough money then he will shut down.

There is also still a lot of software for sale at our bargain table. Some titles include: Final Assault, Battleship, Police Quest II, World Games, StarGoose, Jinxter, The Pawn, The Guild of Theives, Dive Bomber, Harrier Strike Mission and others. Most are selling for a mere $6 and are in their original boxes.

Well, that is about it for this year. I hope to see you in February and be sure to bring all the Christmas ST goodies that you get from Santa.

Nashville Atari User's Group

N.A.U.G.

Nashville Atari Users' Group P.O. Box 121752 Nashville, TN 37212. NAUG meets on the third Thursday of each month from 7PM to 10PM at the Cumberland Museum and Science Center. Membership dues are $24 per family for the entire year. With your membership you will receive our local newsletter, Atari News, a subscription to Atari Interface Magazine, access to the club's 8-bit & ST Public Domain/Shareware libraries, any group discounts on products, and entrance to all club related functions. We have an Associate Membership for $12 per year. With this membership, you will receive Atari News, AIM and access to our 8-bit & ST PD/Shareware libraries. People joining during or after the month of July pay 1/2 the yearly rate. Visitors are welcome to all meetings.

President & Editor	Walt Sullivan	(615) 228-7353
Treasurer	Michael Gardner	(615) 868-0843
8Bit Chair & Librarian	Jerome Seward	(615) 385-9366
ST Chair & Librarian	Lee Griggs	(615) 356-9071

O-ACEs

O-ACEs is a non-profit group interested in getting more out of Atari computers. We are NOT affiliated with Atari Corp. or any other commercial organization -- we are there for YOU! We cover BOTH 8-bit (including the 400/800, XL, XE, and XEGS series) AND 16-bit (ST series) Atari computers. We meet twice each month (except November and December) on the 2nd and LAST Wednesday each month. Doors open by 7:30 pm at La Vista Recreation Center, 8116 Parkview Blvd. (just off 84th Street, south of Food-4-Less and east of 84th at the light)

FIRST MEETING: (2nd Wednesday) Covers news, views, and decisions that ALL members might be interested in. FOCUS MEETING: (LAST Wednesday) Concentrated information on a single topic (such as word-processing, spreadsheets, music composition, desktop publishing, etc.)

Call 592-5427, for more info on O-ACEs!

Meeting News November: For November's meeting , we held our annual election/reelection of officers for the coming year. Only three offices were filled. For President, George Ortiz was voted unanimously in, Bill Zimmerman stayed on as the 8-bit Librarian and the new ST Disk Librarian is the former Vice-president, Pete Killian. No Vice President was voted in, but we are looking. Pete is filling as VP until we get a new one. The end of the month FOCUS meeting was not held because of Thanksgiving.

December: December's meeting has come and gone. We did vote Marc Lombardo for the office of Secretary/FOCUS Coordinator. Marc said he is looking forward to the new year for our club. From our mailbox we received several newsletters from other clubs, especially LACC. We also received our holiday greeting from AIM, thanks.

Also last, but not least, we received an offering from the author of the program GramSlam, the word processor accessory. During our meeting several ideas were floated around about increasing our membership. The main idea discussed was to take out a classified ad in our local newspaper. We are still looking for more ideas, if you have any other ideas, call me (George Ortiz) at 292-1904 or Pete Killian at 592-5427.

Upcoming Focus Meeting Subjects

We will be back to our normal schedule in January, when Pete is going to show/discuss in-depth the Aladdin program for Genie. I am going show/discuss Combat/Simulation programs for February 1991.

New Membership Benefits!

Pete discussed new benefits we just instituted for new members. Among those new benefits is a one-time only chit for new members. The new member must redeem this chit within one month after it was is issued for a disk of his choice from the club library.

Our disk library has been relatively stagnant recently, what with our previous librarian being called out of the country unexpectedly. We have been adding AIM disks regularly, but there has been little else coming in. We 'aim' to do more for you our members! Even better, we think a lot of you can help to mak things better by contributing PD/shareware you have that is not yet in our library. To make things sweeter, every one of you have a limited time (until the end of January 1991) to bring in as full a disk as you can and trade it for any other disk in our library. Now that you each have your own library disks (I still have some members that have not claimed theirs), use them and bring back some goodies, even if they are also oldies!

Local Show Coming Next Year

We have already been contacted about an annual event in our area, a Computer Expo held at a local junior high school. Our group has had a prominent place at the show for several years now, though primarily as a fairly ad hoc show and tell of some members favorite programs/hardware. This year maybe we can do a theme presentation (any suggestions welcome) and do even more to get the word out about our favorite machines. The show will be coming up in March 1991, more about that later.

Well that is all for now, Merry Christmas and Happy New year.

George

PAC

The
Portland
Atari Club
with the
Original
Eugene Atari
Computer
Enthusiasts

Annual Dues $25.00
Newsletter ONLY (year) $10.00

Portland Atari Club and the original Eugene ACE

We of the Portland Atari Club are very excited at becoming members of AIM. PAC is one of the oldest Atari clubs and still has active sections of both 8-bit users and ST members. We currently are available through the ACE of America BBS at 503-285-4417 operating on 300/1200/2400 baud. Club meetings take place the first Monday of the month at the Northwest Service Center on NW 18th and Everett. All are welcome. Meeting time is 7 till 9:30 pm.

The Portland Atari Club wishes to announce the results of the elections for positions on the Board of Directors.

President: David Hunt 286-6276
Vice-Pres.: Ben Smith 256-9974
Sec-Tres.: Mel Anderson 232-7231
Sergeant at Arms: Dutch Leonard 257-0481
8-bit Librarian: John Johnson 655-2092
ST Librarian: Teri Williams 771-7337
Membership Sec.: Randall Leong 246-6354
8-bit Program Dir.: Bob Beck 206-693-0347
ST Program Dir.: Paul Karczag 256-4199
Sig Coordinator: Mel Anderson 232-7231
BBS Director: Chris Healy 775-5295

I would like to congratulate the lucky winners, and commend those who ran unopposed for their willingness to serve.

In addition to having our annual elections, we also held our November swap meet and there were some very good bargains to be had. There were a couple of items I didn't even know existed! My only regret is that I was so busy running the meeting and elections I didn't have the time to spend any of my own money. It's not like I don't have enough stuff already but there is always something new to see and enjoy. We also passed a revision to our club charter which essentially removes the extra year of free membership for board members. This was passed unanimously.

By the time you read this letter we will have also had a hopefully successful Christmas party and will be looking forward to that new little Atari bonus under the tree. Maybe a monitor or printer, or how about a 9600 baud modem?

There is a BBS you may call which contains information on and about the club. ACE of America at 285-4417, 2400 baud and under. The monthly AIM disk is also available from the librarian at a reduced price. You must come to our monthly meeting where you can get this fine disk for $2.00 plus a blank disk in exchange.

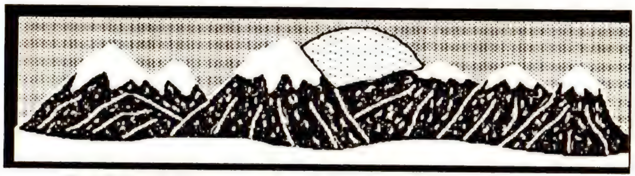
Membership to PACE is $30.00 per year or $9.00 per quarter. General meetings are held at 6:30pm on the third Sunday of every month. In the event of a holiday, a new date will be chosen and will be posted within the pages of this newsletter and on local Bulletin Boards. Membership includes a monthly newsletter, monthly meeting, FREE Disk-of-the-Month, access to our BBS, FREE printer ribbon re-inking, and FREE copying priveleges to our VAST collection of 8/16 bit Public Domain programs. Ports A.C.E. is an alliance of families with a mutual interest in the Atari Computer and is an independent, non-profit organization. PACE hardware assets: 130XE, 1050 Drive, MacInker and a Supra 300 baud modem. Any written correspondence should be addressed directly to Ports A.C.E., Tracy Hendershot, 4835 Crosley Avenue, Duluth, MN 55804.

I hope this Holiday Season has been special to all! The New Year is off to a great start. Our club has finally purchased its own 520ST-FM (The "F" stands for internal floppy; "M" means with built-in RF modulator.) No longer will the ST people have to bother with disconnecting their systems at home and lug them to the meetings. This will be an excellent system to start with and the ST Librarian said he saw no trouble transporting it to each meeting. Come early this month and work or play with your clubs' 520ST!

Larry Nadeau has undertaken quite a few 8bit projects this winter. Already, he has completed hard-wiring an IBM keyboard into his 130XE, lights and all. Mr Nadeau also says he has an awesome project in the planning stages and may even surprise us by Spring! Way to go Larry!

Many rumors and flying about lately. Since they are only rumors, I won't bother you with the boring details and just waste space in AIM, I'll bore you at the meeting! Also election of officers this month, so try to attend our next meeting on Feb 17th.



P3Atari Computer Enthusiasts (P3ACE)

Serving the Colorado Springs, Colorado ATARI community since 1982. PO Box 17779, Colorado Springs, CO 80935

President:	Rick Reaser,	380-8082
VP ST:	Terry Quinn	548-1954
VPXE:	Dave Koster	550-1410
Treasurer:	Sam Cherry	528-5071
STLibrarian:	Rick Mount,	596-8631
XELibrarian:	Dan Rumery	392-3568
Editor:	Ed Fletcher,	596-1130

The masthead should show our "new and improved" club officer compliment which was elected at our annual Christmas meeting. Some new and some old faces are included. We are still looking for an 8-bit VP. In the meantime, Dave Koster and I will be taking up the slack.

For those of you who missed it, the annual Christmas meeting/party was a real success. We managed to give away a good amount of 8-bit and ST software. We even sold a few things for $2 bucks apiece. We consumed mass quantities of goodies. Steve Leser even brought a cake. About 30 people made it in all. The club treasury and membership count are in good shape as reported at the meeting by Jerry Sundee. We discussed the AIM options and most felt it would be nicer to get the magazine faster. We will also start sending out reminders to people to renew their memberships this year. If you have any other suggestions to make the club better, please let one of the officers know. The club is going to join the Atari User Association (AUA) and try to get on the official Atari user club list for he billionth time. (Maybe they don't like us. We keep sending in our name, but they never respond.) Who knows, maybe Bob Brodie will even visit Colorado Springs. We are also going o try and get more outside speakers to come to the club, like from Denver. Hopefully, more or our 65 members can make it next year to our gala Christmas gathering.

The November ST SIG was a great success. Over 40 people showed up. What a shocker!!! Three new members were added to the club roles. The topic was utilities and Steve Leser had a nice program for us all.

As is always the case, we need more of you to write up articles for AIM to keep it the high quality magazine that it is. Several of us have written articles already, and we hope to see more.

LASERNET BBS (591-4620) now has several FidoNet echos up and running. Be sure to check in for the latest in Club News and happenings. If you don't have a modem, call me about borrowing the club's 300 baud Hayes "loaner modem."

For those of you who are on GEnie, be sure to check out GEnie Lamp. Our own John Peters is the editor. Terry Quinn is a frequent submitter, along with a few other members.

Please exmaine your address label to see how your membership is faring. See you at the next SIG Meeting.

PHAST - Phoenix Area ST

The PHAST monthly meetings are held on the second Saturday of each month at 8640 N. 19th Ave., Phoenix, Arizona from 9am to 12pm.

The Rushmore Atari Computer Enthusiasts is a nonprofit organization of Atari computer owners not affiliated with Atari Corp. Meetings are held on the third Saturday of each month, 2pm, at the Westminster Presbyterian Church. Annual dues are $12 for basic membership and $15 for membership and newsletter. RACE offers the Black Hills Atari owner hardware and software support and the largest library of public domain Atari software in the state of South Dakota.

NO PIRACY WILL BE TOLERATED AT ANY RACE FUNCTION!

President	Rick Burton	(605)-642-5353
V. President	Duane Charter	

RACC
ROCKFORD ATARI COMPUTER CLUB

WE'RE NOT JUST PLAYING GAMES ANYMORE!

Rockford Atari Computer Club is comprised of avid, dedicated users of all Atari computers. We support and promote the use of 8-BIT, and ST/MEGA machines with extensive PD libraries, monthly meetings, and semi-regular SIGS.

We have had a change of meeting place this year, as our previous site is being used for adult education on Saturdays. We may be able to secure a regular space there, if we can agree to meet at some other time/day (possibly evenings?). Any suggestions, or other alternatives should be mentioned at the meeting. Our regular business meeting is held from 9 to noon, the third Saturday of the month.

We have accepted the gracious hospitality, of the Springbrook Congregational Churches as an alternative meeting place. It is located, off Alpine, just as you make the turn onto Springbrook road, from Spring Creek road. Our mailing address is 3902 15th Avenue 1 - Rockford, IL 61108. Our phone number is [815] 397-5316.

SEVAC

South East Valley Atari Connection meets the third Saturday of each month at 10 AM at 3234 S. Fair Ln. (Eaton Business Park, just off of 48th Street and Southern), Tempe, Arizona. Yearly membership is $12.00. Membership includes reduced prices on PD ST and 8-bit libraries and monthly newsletter.

R.A.C.E.

President	Eric Schofield	851-5134
Vice president	Brian Casper	851-8092
Secretary	Tony Manino	851-8092
Treasurer	Jim Harrop	851-5134

Hey gang! Things are looking up in the Atari world! The Mega STe was announced by Atari Corporation at the November Comdex and it was supposed to have started shipping in December in Canada. Perhaps by the time you read this, it will be available in the good ol' U.S. of A!

Many months ago, I asked the club members exactly how many of you would be interested in a monthly club disk. At that point in time, we had at least a half dozen hands raised. As of right now (December 16) we have had only 3 subscriptions to this monthly disk. Why? The officers and I are working really hard to support the Atari community, it would be nice if the Atari community would help support the club. We need active members (let's not let our monthly attendance get low!), we need those subscriptions for the monthly disk (it's a good disk and we're working hard to keep it going, it takes many hours every month on behalf of me and Tony Manino), we need all of the members who haven't paid or haven't been active to make a decision ---> support the club or just be a loner.

Perhaps I sound a little bit upset. Sorry gang, I am. I am a full time student in school taking 18 credit hours, I have 2 jobs (I've pretty much quit one of them), I have family which I like to visit once or twice a month, and I am also the president of our users group. People complain about not having enough time to do things, well, I don't have enough time to do a lot of things neither. I'm only asking you to show up to the monthly meetings or to at least get involved with the club in some way or form. I think there are a few of you out there that don't appreciate the amount it takes to keep this club going.

Starting immediately, if you know someone who is interested in joining the club, tell them to get their subscriptions in as soon as possible. For the past 9 months, the officers have been catering to these people who continue to say "I'll pay the club dues next month." We are not going to waste anymore time calling these people. If they want to join the club, they'll join. If not, then so be it. I won't lose any sleep over it.

Let's get things in gear and make the club as good as it should be. By the time you read this, we should have an Atari dealer in the Raleigh area, I hope that you will support them and that your mail ordering volume will be reduced to nothing.

Next month's meeting will feature the Juggler! This is a program that will allow you to have several programs loaded into memory at the same time. Much like the MultiFinder for the Mac (except without the memory crashes). It should be really interesting and I hope that you will show up. Call me or any of the officers if you have any interests or questions.

Meeting: February 19 (Tuesday) at 7p.m. Richard B. Harrison Library "Juggler" memory partitioning demonstration

President	Claudette Tishcler	226-5644

STAG
Saginaw / Tri-City
Atari User Group
"where the deer and Atarians play"
ST

The Saginaw/Tri-City Atari User Group meets the last Saturday before the 18th of the month, at 9am, at the Rudy Zauel Memorial Library, on the corner of Center and Shattuck in Saginaw Township.

President	Bryant LaFrenier	(517) 835-2234
ST Librarian	LeRoy Valley	(517) 686-6796
Tres./Sec.	Marty Schmidt	(517) 792-6029
8bit Librarian	Ted Beauchamp	(517) 686-8872

Club dues are only $20, which provides support for both the 8bit and ST, and fill access to the club's Public Domain library, along with a year's subscription to Atari Interface Magazine.

December Meeting: The December 15th meeting featured our annual swap meet. Only a few people showed up even though historically we usually have a good crowd. A few bargains were available but not much happen.

We tried to plan for the Fashion Square Mall Community Fair in Saginaw on the 4th-6th in January 1991. This show gives us one of the few opportunities to present the world of Atari computing to our fellow neighbors in the Tri-City area. With possible presentations of MAC and IBM emulators along with the computing power of an Atari computer, our group will impress the visitors at the mall.

For the JANUARY 12th MEETING: In the January meeting, we will look at Desktop utilities like NeoDesk 3.0, DC desktop with DC Utilities, and QuickTools. Hopefully, we will attract a few new members to the group once the STAG group present ourselves at the Fashion Square Mall in Saginaw, MI in January. Show Off Your Atari St!!

Equipment Volunteers For January 12th are Bryant LaFreniere with his monitor and 1040ST.

STUN

The ST Users Network -- supporting users of the Atari ST, Mega, and newer technology computers. P.O. Box 27285 Salt Lake City, Ut. 84118. STUN operates a 24 hour BBS -- (801)272-4243. Open meetings are held on the 3rd Wednesday of each month at 7 P.M. in the Murray High School.

The Southcentral Pennsylvania Atari Computer Enthusiasts support both 8bit and ST computers. Dues are $15 per year and include a subscription to AIM and SPACE Probes. Information can be obtained by writing to us at PO Box 11446, Harrisburg, PA 17108.

ST☆R
ST ATLANTA ROUNDTABLE

STAR (ST Atlanta Roundtable) meets at Shoney's at 6551 Peachtree Industrial Boulevard at 7p.m on the Third Monday of each month. Membership dues are $15 per year. Each member will receive a copy of AIM and a new PD Disk is available each month. For membership info contact Ed Cadow, Claude Brewer Rd, Loganville, GA 30249 or (404) 466-0014.

President	Bruce Hein	(404) 926-0095

Newsletter Ed.	Jim Menegos	(404) 473-9885

ST.A.R.R. ST Atari Road Runners

THE #1 ATARI USER GROUP IN THE NEW HAVEN (CT) AREA

ST Atari RoadRunners is probably now the oldest continually running Atari user group in the state of Connecticut. The club was organized in March 1986 by one of the New Haven area Atari dealers and at that time we were strictly an ST club. As time went on, other Atari groups started to disband and we found ourselves in and among the 8-bit users.

We hold our meetings at Greater New Haven State Technical College, in North Haven, CT. Our meetings have traditionally been held on the first and third Thursday of each month. However, starting in January 1991, we will hold only one meeting per month and that will be on the third Thursday. The first meeting of the new year will be January 17th at 7PM. Hopefully, we will be in Room 307.

If you would like more information about ST.A.R.R., feel free to contact one of our officers listed below. And, do call the ST.A.R.R. BBS -- our sysop gets lonely sometimes.

Matthew Masserman	President	(203) 621-7007
Lou Demetriou	Exec VPresident	(203) 271-0452

SWAG
Southwest Washington Atari Group

The Southwest Washington Atari Group was formally created in April, 1985; prior to that, local Atari enthusiasts met on an irregular basis. The group has been holding its meetings at 6:30 p.m. on the last Sunday of the month (save July) at Clark County Fire District #5, Station 3 on 213 NE 120th, Vancouver, WA. SWAG started out with a large following of 8bit owners and as more and more members upgraded to the Atari ST, the membership has become mainly ST owners, but 8bit is still supported. Annual dues are $12 and SWAG can be contacted at PO Box 1515, Vancouver, WA 98668.

Allan Coker	President
Steve Traxler	Vice President
Gary Lentz	Sec/Tres/Librarian
Michael Calvin	Newsletter Editor
The Bear Cavern BBS	(206) 574-1146

Salinas Valley Atari Computer Enthusiasts

SVACE is the only Atari user group in the Monterey Peninsula area. It supports both the 8-bit and ST computers. There is a free disk of the month for all attendants, bring your own disk. Dues are $12.00 per year and includes Atari Interface Magazine. Meetings are at 7:30 P.M. on the first Tuesday of the month at the Salinas Community Center. Demonstrations and raffles are a regular part of our meetings. SVACE can be contacted at 672 E. Romie Lane, Salinas, CA 93901. Anybody interested in Atari computers is welcome.

We have had interesting meetings lately. By combining hardware from different users, we were able to scan things and print them on a deskjet. We had another meeting and again by combining equipment we connected two ST's together with a null modem. We then had demos of games that can be played by modem and a telecommunications demonstration.

The next meeting (which may have happened already) will be on MIDI. We expect to have two keyboards a number of MIDI programs and a demonstration of Sierra-on-Line's use of MIDI sounds in their games.

TACE
Tinker ACE of Oklahoma

Tinker ACE of Oklahoma meets the first Saturday of each month at 1 PM (12:30 set-up time) in the Moore Public Library, 225 S. Howard, just off of SW 4th and I-35 in Moore. TACE can be contacted at 104 E. Northrup, Midwest City, OK 73110 or at the TACE BBS (405) 755-9561, 24 hrs., 3/12/2400 baud, running Oasis 4.3 software with over 60megs online storage. ST & 8bit support. Dues: Full - $20, Correspondence - $15. Dues are prorated at $1.25/month for correspondence membership and $1.66/month for full membership.

WAUG

Windsor Atari Users' Group

The Windsor Atari Users' Group (W.A.U.G.), founded in 1982, is among the oldest computer clubs in North America to serve the Atari community. We are an international family of Atari owners with members from across Southwestern Ontario and the state of Michigan.

Our club meets every third Thursday from September through June with the exception of December when we meet on the second Thursday so as not to conflict with Christmas scheduling. We meet at 7:30 p.m. at the Roseville Gardens Community Centre, 6500 Roseville Garden Drive, Windsor, Ontario, CANADA.

Our club dues are $25(Canadian) per family membership. Each membership entitles you and your family to attend our regular meetings, as well as receive the AIM magazine as well as our own monthly publication, 'exSTracts'. In addition, each membership gives you access to our ever growing public domain library, packed with programming from around the world. Each club disk sells for $4.00 (Canadian) with the occassional monthly special as offered by our club librarians.

President	Brian Cassidy	(519) 966 0305

Software Coor.	Larry Latam	(519) 839 5096
Library Coordinator	Kevin McMahon	(519) 944 8935
Editor	Thom Woodrich	(519) 948 5448
Associate Editor	Shawn Cassidy	(519) 966 0305
Past President	Ray Caille	(519) 734 8183

Our September meeting saw the introduction of the new AIM disks of the month added to our expanding library. We were also graced with a visit from a former (but honourary lifetime) member, Allen Bargen now living in Kitchener, Ontario. We also had a few new games shown by Larry and Kevin. They treated us to SIM City and Police Quest II.

October, being election month, saw the addition of five new members on this year's executive. Following the elections, we had a change from our usual swap meet with that of an auction instead. With the talents of our auctioneer, Wally, we were able to raise approximately $200 for our club coffers. It was agreed that this was a more entertaining event than a straight swap meet.

In November the membership approved the motion to apply for a Wintario grant to acquire a new STe, hard drive and modem to establish a BBS in the near future. As well, Brian and Shawn showed off Battle Chess and Wayne Gretzky Hockey. Brian assured everyone that the new TT will be on display for the December meeting, in time for early Christmas ordering.

Things to watch for in future W.A.U.G. meets, the Stacy 4 with 40 Meg Hard drive and MIDI, Supercharger, Spectre GCR, the DVT VCR harddrive backup system, the Migraph Hand Scanner with Touch-Up, a new paint program in development (locally) and maybe even a visit from an Atari (Canada) representative. See you next month.

WACO

WESTMORELAND ATARI
COMPUTER ORGANIZATION

Westmoreland Atari Computer Organization meets the second Tuesday of each month in the North Huntingdon Township Town House, Center Highway and Brownstown Road (just off Route 30 near the Hamilton car dealerships, Irwin, PA) at 7:30 P.M.

Founded in December, 1983, WACO boasts huge ST and 8bit PD libraries. Double-sided disks are only $3 for members, $4 for non-members. Disk catalogs on disk are only $2. The $20 annual membership ($24 for family) now includes a subscription to AIM.

WAUG!

The Washtenaw Atari Users Group meetings are held every second Tuesday of the month at 7:30 pm in the Michigan Union building on the campus of the University of Michigan on State St. at the corner of S. University in Ann Arbor.

Club dues are $15 per year and provide access to the PD library and subscription to AIM. Meetings feature demos of both 8bit and ST software and hardware. Nonmembers and questions are welcome. Officers can be contacted by calling Craig Harvey at (313) 994-5619 or by BBS at Molin's Den at (313) 451-0524.

The December meeting of WAUG was held on 12/11. Craig called the meeting to order at 7:20pm, stating that he was making up for all the times the meeting had been called to order LATER than 7:30. This had no noticeable effect, however, so he called the meeting to order again at 7:40 (which seemed just about right!) Craig announced the meeting topic would be Christmas Party/Games, but this came as no surprise to anyone who was watching Pattie set up the cookies/soda pop table...

"Nobody gets any cookies or pop until AFTER I talk!" Craig warned, and then set about discussing continuing progress of plans for the Atarifest. Pattie helped describe events of the past week, noting that Atari Canada will probably do most of the leg work for the show while it would seem that Bob Brodie will be there and that is just fine with everyone involved!

Bill Rayl spent a few minutes discussing the contents of the ST Disk of the Month, followed by a request from Mike Olin for volunteers to help stuff envelopes containing User Group info about Atarifest. Many thanx to Soft-House Computer Center of Garden City for their contributions! The rest of the evening was spent in conversation and merriment.

Happy Holidays to all from the officers of WAUG!

FEEL THE SPEED!!

Quick ST II

FREE DEMO AVAILABLE!!

Software Screen Accelerator version 2.21

- speeds up your ST's screen graphics
- faster than hardware accelerators
- speeds up all fonts, including GDOS fonts
- requires less than 28K of memory
- supports all screen resolutions
- supports custom desktop backgrounds

The magazine reviews said of Quick ST II:

"***amazingly FAST***" - Nick Berry, PSAN (4/90)

"***I highly recommend this package***" - Ron Schaefer, ST Informer (6/90)

"***Buy it***" - A. J. Wrotniak, Current Notes (6/90)

See for yourself why over 5,000 fellow Atari ST users swore by Quick ST II in 1990. Buy Quick ST II for only $19.95 (or less) and enjoy a faster ST or STE computer!

ATTENTION ALL ST USERS!

Have you received your copy of the Branch Always Newsletter yet?

We have just released our year end newsletter packed with complete product information about our **Quick ST II** and **Quick Tools** packages, update info, dealer lists, hints and tips about using our products, questions and answers from our users, user group discount info, and valuable discount coupons for our new products for 1991. The newsletter was sent free to all registered users of our products and to all user groups in Canada and the United States. **To receive a FREE newsletter, send us your name and address and a copy of this ad.**

Quick ST II and **Quick Tools** are available at most Atari ST dealers across the U.S. and Canada. If ordering direct, add $3 s/h for U.S. destinations, and $5 elsewhere. U.S. dollars only please. For credit card orders, call our order line at 206-783-0933, business hours. **FEEL THE SPEED! DOWNLOAD THE FREE QUICK ST II DEMO.** Download QST22DEM.ARC from Genie, Compuserve, or the BBS.

"PHASE-3"™

PRISM-PAINT

PRISM-PAINT 1.0 is a powerful drawing program that runs in all ATARI resolutions plus 1024X768 4096 color mode and 24 bit true color with 16 million on-screen colors and is fully TT-32 bit tested and 68030 compatible. Not only will you find many of the features expected in a drawing program (such as boxes, circles, ellipses, area fills, cut, copy and paste, (with fine pixel editing), but also explores some rather unique areas of it's own! One of the more interesting areas of **PRISM-PAINT** is that it uses **PRISM-TABLET** (Graphics Tablet Environment) which supports the new Cal-Comp graphics tablet in four resolutions. Another feature of **PRISM-PAINT** is that it uses all of the computer's memory to support multiple picture buffers. This can range from approximately eight buffers on a 520ST to over 110 buffers on the MEGA4 ST, which allows the creation of animations using the built-in slide-show features.

When used in combination with other PHASE-4™ programs **PRISM-PAINT** takes full advantage of ADEPT* and the Image Systems ISAC High-Res color board.

PRISM-TABLET

(Graphics Tablet Environment)

PRISM-TABLET is a fully functional graphics tablet environment designed to be used with all "PHASE-4"™ programs. This feature is embedded in all programs and available as a stand-alone program which can be used with most well-behaved ATARI programs.

For more information write or call Lexicor Software Corp.,
58 Redwood Rd., Fairfax, CA 94930, (415) 453-0271.
Dealer inquiries welcome.

NeoDesk™ 3 is a complete replacement of the boring, built-in desktop that comes with the Atari ST. Its advanced, yet intuitive, graphical interface will make your computer both easier to use and much more powerful.

It is the easiest and most affordable way to realize your Atari's true potential. Many have called it "the ultimate upgrade for the Atari ST".

NeoDesk introduced the idea of placing your commonly used programs directly on the desktop while pioneering the concept of assigning different custom icons for individual files and folders.

Now NeoDesk 3 takes you a step further, introducing several new and original concepts which will make you want to scream "I want my NeoDesk 3!".

In addition to keeping commonly used files and programs on the desktop, you can now also keep folders on the desktop. And not to limit your creativity, with NeoDesk 3 you can even write *Desktop Notes*™ right on the desktop itself.

Only NeoDesk 3 allows you to look at two different parts of the same window, thanks to its amazing *Split Window* feature. Of course, each window can be set to display text or icons, independently of any other window. Each window can even have its own sorting and text options.

NeoDesk is also smart, using all of its available memory for file copying so that as many files and folders that will fit into memory are read in at once. No more useless disk swaps, even hard drives benefit from its speed and efficiency.

Add some of the other NeoDesk 3 features, such as a brand new Icon Editor, keyboard equivalents, desktop picture, file templates, *Active Icons*, and *Hot Keys* (execute your favorite program with a single key), then you have more than enough reasons to buy NeoDesk. But for those of you who need a little more, read on.

NeoDesk 3 now offers a unique *File Clipboard*™ which lets you temporarily hold files and folders in memory while you are busy doing other things. In a way, you can think of it as an automatically expanding and shrinking ramdisk.

You now also have the power of *Macros*, with which you can automate any series of desktop operations like opening windows, copying files, running programs, etc. These can also have *Hot Keys* assigned to them.

NeoDesk 3 even has special support for 5 1/4" floppy drives and formats all disks with the correct information so they work on most MS-DOS computers.

From low resolution to ultra high resolution, NeoDesk 3 supports up to 10 different resolutions in each system.

Of course, these features would not be useful unless they were easy to use. Rest assured, NeoDesk 3 has been designed to be "upwardly compatible". Use NeoDesk just like you used the original desktop, no need to forget all that you have learned.

It doesn't stop there. The included *Recoverable Trashcan* lets you recover files deleted with it at any time in the future. It was created using the *NeoDesk Developer's Kit*, which opens a whole new world of possibilities. There's also the *NeoDesk CLI* (both available separately), a complete window based command line interpreter which allows you to create pop-up menus, automate file operations, and much more.

No matter who you are, NeoDesk 3 has something for you. From helpful search capabilities to a powerful file reorder function. Thanks to its ability to remove itself from memory, it only needs about 35K of memory. Of course, there's lots more, which you can discover by ordering today!

NeoDesk 3 and the NeoDesk CLI are available from your local dealer, or order toll free by calling (800) 284-GRIB and get FREE 2nd Day Air (US only). Call or write for upgrade and other information.

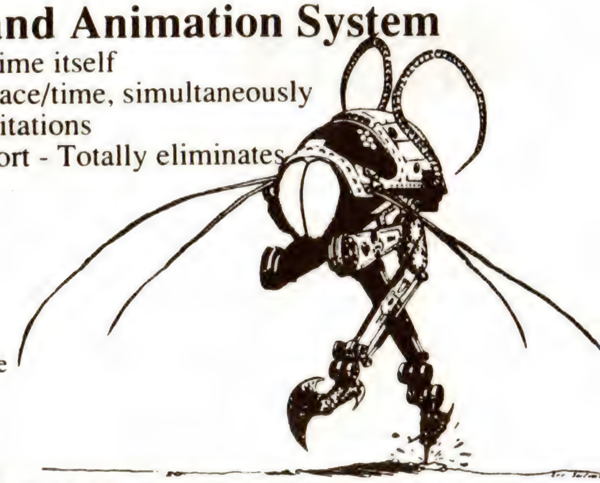
Take Total Control Of

TIME and SPACE

PHASE-4™ Solid Object Motion Control and Animation System

- Opens a 4th dimension in which you actually cut, copy and paste time itself
- View 3D objects in the past, present or future from any point in space/time, simultaneously
- Do cyclic polymorphic transformations without point and face limitations
- Fully mouse- and tablet- driven programming with keyboard support - Totally eliminates program control codes
- Supports all ST and TT resolutions
- Outputs to P.I.X.A.R.'s Renderman RIB files



ROSETTA-3D Translator/Viewer - $89.95

☐ Translate from one CAD, animation or rendering format into any other supporte
☐ Translation file size limited only by mass storage device - not memory size
☐ Translate entire folders using wildcards
☐ Import individual objects from within a file
☐ Quickly create and preview animations with simple "point-and-click" animation
☐ Unique 3D object marker enables design of animation storyboards in seconds not minuites or hours
☐ High speed wireframe and depth-cue wireframe modes
☐ Amazingly fast depth-cue point cloud mode for real time playback of large objects
☐ Several solid polygon modes - uses revolutionary new polygon drawing algorithm for lightning fast display

CHRONOS Key Frame Animator - $249.95

☐ Create stunning and complicated 3D animations without programming a single line of code
☐ Makes animation as simple as point-and-click... no complicated motion control language
☐ Point-and-click object, camera and light manipulation provides very inuitive user interface
☐ Spotlighting and shadow casting funtions built in
☐ Unique ability to cut, copy and paste motion for repeating complex motion sequences
☐ Data compatible with all Cyber™ series products

PRISM PAINT Drawing Program - $79.95

☐ Runs in all ATARI™ resolutions plus 1024X768 4096 color mode
☐ 24 bit true color mode with 16 million on screen colors
☐ All the standard paint program functions (circle, box, elipse, fill, cut, paste, copy, pixel editing etc.)
☐ Supports the Cal-Comp graphics tablet in four resolutions
☐ Create animations using the built-in slide show features

PRISM RENDER - $89.95

☐ Turns wire frame creations into "photographic" quality images
☐ Materials editor turns rendered surface into wood, chrome etc.

PRISM TABLET DRIVER - $49.95
PRISM TABLET w/driver - $224.95

Free Compuserve On-Line Support

ATARI BULLETIN BOARD

Bill & Pattie Rayl

Atari Corp. News

There has been lots of activity in the Atari community this month. Perhaps the biggest event was the non-conference with Sam Tramiel on GEnie on the 30th of January. It was a non-conference because GEnie's Grand Hall could not handle the number of people calling in to talk to Sam. The conference was moved into the Grand Hall to keep this from happening, since the Grand Hall is supposed to accomodate a large number of users.

Before the conference began, we were dropped off GEnie at least eight times, and there were several more service failures while Sam was speaking.

Over the few years that GEnie has been the official online support system for Atari, there have been four conferences with Sam Tramiel. Only one of those conferences has been a success with no system failures. The very first Sam Tramiel conference crashed GEnie altogether, whereas this conference just seemed to be bombing out the conference area.

The conference was nothing if not chaotic, and, judging by comments from paying subscribers, left attendees upset with GEnie and perhaps Atari as well. To try to make up for the fiasco, GEnie held another conference with Atari Computers Director Greg Pratt during the following week's regular Wednesday conference in the Atari ST Roundtable.

Sam Tramiel is scheduled to speak on CompuServe in the Conference Center late in February. The CompuServe Convention Center can handle over 500 users, and the past conferences with Sam in the Convention Center have been a success.

During the GEnie conference, the subject of advertizing was brought up, but never given a full discussion. According to Sam, Atari will not have a major ad campaign.

However, Atari will give ad money to dealers to build up Atari in their specific area. Atari no longer requires dealers to purchase a set amount of equipment, nor does Atari want the dealer to pay for it first and then reimburse them for half when they fill out paperwork.

Atari will now also pay up front for ads the dealers wish to run, whether newspaper, radio or TV ads. This refocuses Atari's policy about co-op ads, where advertizing depended on the dealer having enough spare cash to run all the ads and get back some payment down the road. Now, a dealer can get the funds from Atari to help strengthen his business, which strengthens Atari's presence in the dealer's area.

New Distributors

Atari has also signed up with distributors like Pacific Software to sell all the Atari hardware except the TT. This gives dealers more access to equipment since Pacific Software is the largest supplier of Atari software and most dealers order from them already. This means dealers aren't relying solely on regional firms to obtain equipment.

In the past, this system didn't work as smoothly as it might have because many of the rep. firms didn't give major effort to Atari and promoting Atari products.

Also, many dealers didn't have a regional firm to deal with, and this seemed to create a strain on Atari to make up the slack. Atari stopped going through distributors because dealers complained about mail-order houses undercutting their prices. Atari did this for the dealers, and has since acknowledged that this almost killed them.

Prices Drop!

On top of signing up three new distributors for Atari products, Atari has lowered its prices to dealers! Users across the country are seeing prices on new 1040STEs of $399 or less (without monitor). The suggested retail for the Portfolio has decreased from $399 to $299 and the Lynx has gone from $149 to $99. The price of the TT has also come down with the 2Meg/50Meg hard drive version starting at $2399 (with monitor). Megas have been spotted for less than $1000.

MegaSTEs have been spotted at dealerships too. Last month, we reported the Mega/STE passed FCC Class B testing, and now the TT and Mega/STE are shipping. TTs are being shipped to value-added retailers (VARs), but your local dealer may be a VAR. As of this writing, the TT had not passed FCC Class B, but was expected to soon.

At the recent Atari Show in Vancouver, British Columbia, a 1Meg version of the Mega/STE was shown. The thought behind such a machine, it seems, is allowing dealers to configure the Mega/STE to the taste of the buyer. Many users already own larger capacity hard drives than what comes in the Mega/STE, and it would be very simple to upgrade the SIMMs in a 1Meg Mega/STE to 4Megs of RAM. Currently, there is no word about whether we'll see such a machine in the US.

Atari Demo Contest

Apparently dealers have been clamouring for demos to show off the new features of Atari's hardware. To help them, Atari has announced a demo contest looking for demos that feature DMA sound, digitized speech and advanced color graphics that will make people want to buy an STe, Mega/STE or TT.

Demos should take advantage of the expanded color palette, or show off the abilities of existing packages such as the Cyber series or Deluxe Paint, or be self-running, interactive demos that a shopper could get involved with in the store. All submitted demos will become the property of Atari, and will be freely distributed to dealers and users. One winner and two runners-up will be chosen by Atari staff.

First prize is a TT; second prize is a Mega/STE; and third prize is a Lynx with two game cartridges. Entries should be sent to ATARIDEV on GEnie or 70007,1072 on CompuServe or mailed to Atari Corporation, 1196 Borregas Ave, Sunnyvale, CA 94086, Attention Bill Rehbock. All entries must be postmarked no later than March 26, 1991 and received by April 5, 1991.

Developer News

Jay Craswell, creator of the ISAC board, is now on his own as Dover Research. He's currently developing a VME graphics card for the Mega/STE. There has been discussion of a convertor box for products requiring the Mega expansion box. Also, George Richardson of Merlin Group, Inc. is developing a color/mono video VME card for the new computers.

Practical Solutions has closed its doors as of January 31st. A spokesman for Practical Solutions said a slow summer and fall season plus the onset of the recession depleted their revenues, leaving investors and bankers with the feeling it was time to call it quits.

Bob Luneski, author of the hard drive utility Diamond Back, announced he has cancelled Data Innovations' license to distribute Diamond Back II, effective March 8, 1991. Bob's company, Oregon Research Associates, will release an update to Diamond Back II on March 8. Current owners can upgrade to version 2.02 by sending their original disk and $7.50 to Oregon Research Associates, 16200 SW Pacific Hwy, Suite 162, Tigard, OR 97224.

Soft-Aware, Unlimited has announced the latest version of their versatile data/image manager. Version 2.03 of Informer II now allows up to 52 data fields and the user can view external image or text and even HEX files. Included in each package is a self-running demo to give the user a general overview of the program and its basic features. Soft-Aware, Unlimited, 334 B N. Euclid, Upland, CA 91786 or (714) 982-8409.

Menu Plus has just been released by Rimik Enterprises. Menu Plus is a full-featured desktop enhancement that allows users to quickly run programs on floppy and hard drives. Menu Plus allows you to set up a main menu with submenus, plus the ability to view Degas, Neochrome and Spectrum picture from the desktop. Users can also view or print text, with the left and right mouse buttons used for scrolling text up and down the screen. A special AutoPlay feature allows users to play sound files. Rimik Enterprises, 836 Osborne St, Vista, CA 92084 or (619) 630-1217.

Quidnunc Software announced version 2.0 of Stalk the Market will be available soon. It seems a delay was caused by some hardware problems that were only recently solved. Quidnunc Software can be contacted at (214) 243-0663.

Maxwell CPU is now shipping their desk accessory Expose. Expose offers users a notepad and graphics window, as well as a quick display of disk/partition free space, editable date/time clock, a screen snapshot function and more. In the graphics window, users can load in Degas, NeoChrome, Tiny, IMG, GEM and MacPaint files. These can be edited and cropped and then saved in IMG format. Expose sells for $39.95. Maxwell CPU, PO Box 576, Louisville, CO 80027 or (303) 666-7754.

From The Reader's Viewpoint

Dear Editor

Having just read the NeoDesk 3 review in the February issue of your excellent magazine, I felt that there were some minor points in the review that could use some clarification. Let me first state that overall I found the review very complete and accurate; it is a pity larger magazines do not take inspiration from magazines like yours.

First of all, we do not consider our product in competition with Double Click's DC Desktop program. This is something that even the folks at Double Click will agree with. While the programs offer some similar basic features, they are both quite different and intended towards completely different markets.

NeoDesk 3 has hundreds of features and capabilities that are either not available in any other program or only available after buying five or six different utilities (totalling a lot more).

The motivating factor behind all the enhancements and new features in NeoDesk 3 was not competition (after all, NeoDesk 2.0 was already selling quite well) but our users. Their strong support, encouragement, ideas and suggestions convinced us that we should do better.

It was with this support that we sat down and spent over a year of development working on a complete rewrite which resulted in what we have today.

Not only does NeoDesk 3 offer more features and capabilities than any similar program on the ST (including the new TT desktop), it seriously competes with the best desktops and shells offered on other computer systems.

I am sorry that Mr. Pike found our manual index limiting. We worked very carefully on it to include the information which we felt users would want to look up.

As Mr. Pike himself noticed, we did not duplicate a lot of the information that was already included in the very complete table of contents. Based on the mentions, comments and technical support calls we receive, we are confident that our manual has superceded our original intentions and offers the answers that most users seek.

One relevant feature of the program that Mr. Pike seems to have missed is the new "reorder" mode. By using this feature one can change the order of any directory (including the AUTO folder) to any custom order desired.

This not only allows a high degree of customizing (I personally prefer to have all the programs at the upper left of all my windows when I open a folder), but it also makes it much easier to reorganize the AUTO folder. However, Mr. Pike seems to have brilliantly solved the problem by discovering a novel way to do this.

Sincerely,
Rich Flashman
President, Gribnif

Dear Bill and Pattie

Happy New Year to all of you... I just want you to know that I enjoy AIM and look forward to receiving your outstanding magazine each and every month. Keep up the good work.

Perhaps you may want to call to your readers' attention the following events:

In August of 1990, I purchased NeoCept's WordUp v.3.0 from 1st Stop, a mail order firm in Ohio. Right out of the box, the program was full of bugs. The program would crash right after printing a document, which would force you to reset your system. I tried calling the customer service number; it was always busy, so I wrote NeoCept and 1st Stop.

To this day, and after two more letters, neither has replied. NeoCept's customer service number, after being changed three times, is a recorded message telling users to write. I ordered the 8/20/90 NeoCept fix from BRE Software. Now my system crashes before it prints!!

Needless to say, I am out over 80 bucks. I just do not want to see anyone get stiffed with this worthless and unsupported word processor from NeoCept.

There is no help, once you purchase the program.

There is a major shake out going on in the ST marketplace. Future Systems, makers of disk drives, just ceased to exist, which is a shame because they manufactured an excellent drive. I think that, as the ST market shrinks, due to Atari's US market strategies, and with price reductions from Apple and Big Blue, it is going to shrink even more, and we will see more and more vendors and manufacturers drop the ST.

I planned to upgrade my 1040 to 2.5Megs, but do I invest money in a machine that is doomed for extinction? Tell me I am wrong!

Ted Evans

Hi-Tech ATARI 8-Bit!

BRAND NEW ITEMS

$169.95/ $199.95 THE "SUPER E-BURNER!" $169.95/ $199.95

The Super E-Burner is a **PROM/EPROM** copying/programing device that plugs into your Atari's cartridge port. It is the **FASTEST**, most versatile Eprom programmer ever devised for Atari. It will program all Eprom sizes from 2732's through 1 Meg! Its speed is incredible. It can program a 27128 and double verify its contents in 15 seconds! It is a software driven device which allows the user to **READ** and/or **PROGRAM** proms/eproms and save their contents to disk or hard drive. Only $169.95 plus $8 S/H/I. Mini **GANG BURNER** which is the same as above but will burn two eproms at a time is only $199.95 plus $8 S/H/I.

$49.95 "HARD DRIVE PRO BACKUP!" $49.95

A truly useful utility for anyone owning a Hard Drive. It is the simplest, fastest, most versatile HD backup program ever offered for Atari 8 bit computers! It will allow you to stream your data to floppys (up to 8 destination drives!), other HD's, and is VCR compatible if and when our VCR backup interface becomes available!

- **SUPER FAST**
- **AUTOMATIC COMPRESSION** to save disk space
- Allows saving to 8 **DESTINATION** drives!
- Allows saving to another HD
- VCR backup compatible
- Restores individual directories
- Works with **MYDOS** or **SPARTA**
- Will save to **80 TRACK** drives
- Backs up by **ARCHIVE**, by **DATE**, or by selected **DIRECTORY/SUBDIRECTORY**
- Supports **ULTRA HIGH SPEED** disk I/O to capable floppy drives
- Allows **PRINTER DUMP** of all pertinent information

Only $49.95 plus $5 S/H/I.

$99.95/ $139.95 "XF551 3.5" CONVERSION!" $99.95/ $139.95

The **XF551 3.5" CONVERSION kit** for your XF551 drive will double your storage space (750K per disk!) while allowing you to use the far superior 3.5" disks currently being used by many of the major computer manufacturers. Included with each kit is a high quality **SONY** 3.5" drive, completely mounted in a 5 1/4" faceplate assembly, all cables necessary for a **SOLDERLESS** 2 minute installation, and a completely re-written OS (including some incompatibility problems). This is the best quality conversion of its type! Only $99.95 plus $8 S/H/I. A **DELUXE CONVERSION** which allows the use of the existing 5 1/4" mechanism in your XF551 along with the 3.5" drive is also available. It will allow you to access BOTH mechanisms as two separate drives so copying from 5 1/4" to 3.5" disk or vice-versa is possible even when mixing densities! And its totally **SWITCHLESS!** Just insert your disks and DOS does the rest! Kit contains all features of the standard conversion (above) except that minimal soldering is required. Only $139.95 plus $8 S/H/I.

$49.95 "BLACK BOX ENHANCER"!© $49.95

A must for all serious **BLACK BOX** owners! This device simply plugs into your **BLACK BOX** and delivers the following features:

- High resolution screen dumping in 16 shades of **GREY!**
- Dramatically improves print quality of **TEXT** or **GRAPHICS!**
- Built in handler will print **CONTROL** and **INVERSE** characters.
- Has built in Hard Drive **TASK MASTER** utility
- Supports **MYDOS** and **SPARTA**
- Supports all densities
- Built in **SECTOR EDITOR** supporting partitions up to 16 meg!
- Displays **DIRECTORIES** and **SUBDIRECTORIES**
- Built in **SECTOR COPIER** utilizes all available memory
- Copies selectable sectors
- Allows editing of **ASCII**
- **SEARCH** by string (**ASCII** or **HEX**)
- Automatic **HEX/DEC** toggle
- Built in **DISASSEMBLER**
- **EDIT/SEARCH** by 11 or 16 bit links/**SPARTA** sector map/or entire disk

Ideal for repairing blown directories, making on the spot repairs or

REPAIRS

For 24-48 hour repair service on Atari computers or drives, call our repair department at (716) 586-5545 day or night. All work is guaranteed, NO minimum estimate fees; if you have two or more items for repair and don't want to spend any money .... send them to us and we'll use the parts from both defective items to make one good working unit at NO CHARGE ... we'll keep the other defective item for parts!

BEST SELLERS

$69.95 SUPER ARCHIVER $69.95

The new **SUPER ARCHIVER**, obsoletes all copying devices currently available for the **ATARI 1050!** It eliminates the need for Patches, **PDB** files, Computer Hardware, etc. Copies are exact duplicates of originals and will run on any drive; without exaggeration, the **SUPER ARCHIVER** is the most powerful **PROGRAMMING/COPYING** device available for the 1050! Installation consists of a plug-in chip and 6 simple solder connections. Software included. Features are:

- **TRUE DOUBLE DENSITY**
- **ULTRA-SPEED** read/write
- **FULLY AUTOMATIC COPYING**
- **SUPPORTS EXTRA MEMORY**
- **SCREEN DUMP** to printer
- **TOGGLE HEX/DEC DISPLAY**
- **SECTOR or TRACK TRACING**
- **AUTOMATIC DIAGNOSTICS**
- **DISPLAYS HIDDEN PROTECTION**
- **ADJUSTABLE/CUSTOM SKEWING**
- **AUTOMATIC SPEED COMPENSATION**
- **AUTOMATIC/ PROGRAMMABLE**
- **PHANTOM SECTOR MAKER**
- **ARCHIVER/HAPPY ARCHIVER**
- **COMPATIBLE**
- **BUILT-IN EDITOR**-reads, writes, displays up to 35 sectors/track short
- **BUILT-IN CUSTOM FORMATTER** up to 40 sectors/track
- **BUILT-IN DISASSEMBLER**
- **BUILT-IN MAPPER**-up to 42 sectors/track
- **DISPLAYS/COPIES** Double Density **HEADERS**
- **AUTOMATIC FORMAT LENGTH CORRECTION**
- **SIMPLE INSTALLATION**

$99.95 The "SUPER ARCHIVER II"!© $99.95

NOW! COPIES all **ENHANCED DENSITY** programs plus retains all of the features of our World Famous **SUPER ARCHIVER**! (see above). Allows you to **COPY** or **CREATE** single or **ENHANCED** density protection schemes (including **PHANTOM SECTORS!**). Completely automatic; compatible with the **BIT-WRITER I**; the **ULTIMATE BACKUP/PROGRAMMING** device! Only $99.95 plus $4 S/H/I. **NOTICE!** If you already own a **SUPER ARCHIVER!**, you can upgrade to a **SUPER ARCHIVER II** for only $29.95 plus $5 S/H/I (disk only-no additional hardware required).

$79.95 BIT-WRITER $79.95

The Super Archiver "**BIT-WRITER**"! is capable of duplicating even the "uncopyable" EA and SYN series which employ 34 FULL sectors/track. The "**BIT-WRITER**"! is capable of reproducing these and **FUTURE** protection schemes of non-physically damaged disks. Simple installation... **PLUG-IN** circuit board and 4 simple solder connections. The "**SUPER ARCHIVER**" with the "**BIT-WRITER**"! is the ultimate **PROGRAMMING/COPYING** device for Atari 1050's. **EXACT DUPLICATES** of originals are made! Copies run an **ANY** drive. Must be used with Super Archiver. Only $79.95 plus $5 S/H/I.

$69.95 ULTRA SPEED PLUS $69.95

Imagine a universal XL/XE Operating System so easy to use that anyone can operate it instantly, yet so versatile and powerful that every Hacker, Programmer and Ramdisk owner will wonder how they ever got along without it! Ultra Speed Plus puts unbelievable speed and convenience at your fingertips. Use **ANY DOS** to place an **ULTRA SPEED** format on your disks, boot any drive (1-9) upon power-up, format your **RAMDISK** in Double Density, activate a built-in **400/800 OS** for software compatibility, plus dozens of other features too numerous to mention! Below are just a **FEW** features you'll find in the amazing OS:

- **ULTRA SPEED** SI0 for most modified drives
- **ULTRA SPEED** is toggleable
- Boot directly from **RAMDISK**
- Special timer circuits not required for 1 or 2 Meg upgrades
- Background colors adjustable
- Reverse use of **OPTION** key
- Cold-start without memory loss
- Built-in floppy/disk configuration editor (1-9)
- Built in **RAMDISK** configuration editor(1-9)
- **RAMDISK** exactly duplicates floppy drive so sector copying and sector editing are now possible
- Built-in MINI Sector Copier
- Toggle **SCREEN OFF** for up to 40% increase of processing speed
- Toggle internal **BASIC**
- Ram resident disk loader program (**MACH10** menu)
- **DOUBLE DENSITY RAMDISK** capable
- Entire **MEMORY** test that pinpoints defective **RAM** chip
- Boot any drive (1-9) upon power-up or cold-start
- Supports memory upgrades up to **TWO MEGABYTES**
- **THREE** Operating Systems in one (**XL/XE, 400/800, ULTRA SPEED PLUS**)

$39.95 THE "RICHMANS" $39.95

80 Column Word Processor

Easy to use, very **powerful**, and **NO ADDITIONAL HARDWARE** required! Works with TV or Monitor! This "**DISK ONLY**" 80 Column Word-Processor is simple to use while offering numerous features such as:

- Completely Menu driven
- Self contained DOS
- Complete Text formatting
- Built-in Printer Drivers
- Page numbering
- Justify and Endfill
- High speed Cursor
- Spell Checker
- 80 COLUMNS ON THE SCREEN!
- Insert and Delete
- Search Mode
- View only mode
- Memory Statistics
- Alternate Output
- Change screen Colors, borders, luminesce
- Mouse compatible
- XEP-80 Compatible

One expert has compared **40 domestic** and **foreign word-processors and concluded that the RICHMANS 80 Column Word-Processor is the best!** Only $39.95 plus $5 S/H/I. (64K required).

$199.95 The "BLACK BOX"!© $199.95

The **Black Box** is a device for your XL or 130XE computer that adds tremendous power to your 8-bit Atari. It has two buttons, two switches, and a set of dip switches visible from the outside. It plugs directly into the back of the 600XL, 800XL, and 130XE computers. Custom cases may be an optional expense. The **Black Box** performs three main tasks: interface to a SASI/SCSI bus device (hard disks), Parallel printer port, and a RS232 port. A fourth option, available soon, will be a floppy disk port, especially useful to XF-551 owners. The SASI/SCSI port provides the necessary signals for hooking up most common hard disks. You may partition your hard disk into as many drives as you wish; up to 9 can be accessed at at time. By pressing one of the buttons on the **Black Box**, you will enter the configuration menu, where you can re-assign drive numbers, etc. When you exit, you will be right back in the program you were running when the switch was pressed. Each hard disk can be write-protected. The Parallel Printer port will allow you to hook up any printer that uses the standard Centronics interface. As an option, you can use the computer's extra memory as a printer buffer, or order the **Black Box** with 64K of on-board RAM. You may assign printer number and line-feed options within the menu (for use with multiple printers). Another amazing feature of the **Black Box** is the built-in screen dump. By pressing a button (on the box), the contents of your screen will be dumped to your printer (you can define text or graphics modes with a switch)! The RS232 port supplies the full RS232 spec signals for connection to a modem, or another machine (for null-modeming). The handler for the **Black Box**'s modem port is built in and takes up NO memory! The port handles rates up to TRUE 19.2K BAUD! A future upgrade for the **Black Box** is a floppy disk interface board. This will allow the addition of up to four 5.25" or 3.5" mixtures of floppy drives to be used with the system. The drives will act like standard single/enhanced/double density disk drives, but MUCH faster! All drives will be Super Archiver compatible, and support up to 2 sides of 80 tracks. Along with this hardware upgrade will come software capable of reading, writing, and formatting disks in IBM's MS-DOS format and the Atari ST format, and allow you to transfer files between those disk formats and the Atari's format. In addition , a machine language monitor has been added to allow memory disassembly, memory/register changes, and more. The Price of the **Black Box** is $199.95 for the basic unit and $249.95 with 64K of RAM (for printer spooler) plus $8 for S/H/I. An optional custom **BLACK BOX** case is available for $39.95 extra. The Black Box is a product of Computer Software Services...Not the Black Box Corporation!

$199.95 The "MULTIPLEXER"!© $199.95

This device brings the power and flexibility of larger systems to your 8-bit. The **Multiplexer** is a device (actually a collection of modules) that allow up to 8 Ataris to read and write to the same drive (typically a hard disk), printer, and talk to each other. One "master" computer (any 8-bit) is equipped with the master **Multiplexer** interface. Then up to 8 "slave" computers can hook up to the master, each having their own slave interface. The "common" peripherals (things that are to be shared) are connected to the master computer. On each slave, all disk and printer I/O is routed through the master, so no drives are needed on them. The master computer can be configured in any manner you wish - you can for example have certain peripherals "local" to the slave, or routed to a different number on the master. Under development is a BBS system that will make full use of this device, allow ing up to 8 lines/users to be using the system at the same time! A multiuser chat mode is a feature of this program, however, you do not NEED this program to run a BBS with the **Multiplexer** (but be warned that not all BBS programs will run concurrently). All slaves are independent, and do not need to have the same program running on them. This system is excellent for BBS SysOps, because you can be using your hard disk(s) while still running your BBS uninterrupted! Another example is in a classroom situation, or anywhere a disk needs to be shared by different people. This is an EXCELLENT programming/debugging tool as well! The **Multiplexer** price is $199.95 for a master and two slave units (plus $5 S/H/I). Additional slave units are $99.95 each.

HARD DRIVE & LIMITED SPECIALS

Hard Drive Systems include drive, Black Box, a zero RF power supply, controller, cables DOS and assorted HD software. All systems are wired, preformatted and have sample programs on them. Attach to your computer and BOOT! No hassles! We have systems available from 5 meg to 108 meg. Prices start as low as $399.95!

Limited Specials are on a first come, first served basis. Preowned items are in exceptionally clean condition and are in perfect operating order. All items are warranteed. Sorry...no rainchecks...no Dealer Discounts. S/H/I to be determined according to weight and value of each item purchased.

1. 5 Meg removable or 10 Meg fixed Hard Drive Systems...NEW!	$399.95
2. 20 Meg industrial HD system	$495.00
3. 32 Meg industrial HD system	$595.00
4. 64 Meg industrial HD system	$750.00
5. 108 Meg industrial HD system	$995.00
We have all HD sizes from 3.5" to 8" industrial—any capacity!	
6. Adapter 4000A controller	$89.95
7. Adapter 4070 (RLL) controller	$125.00
8. Western Digital controller	$59.95
9. Xebec 1410 controller	$69.95
10. 130XE x/320K Power Plus and Ultra Speed+	$250.00
11. 1050 drives with SUPER ARCHIVE II and SILENCER	$250.00
12. Magnavox 80 column GREEN screen monitors w/sound	$59.95
13. DISKCRACKER (newest version)	$19.00
14. SILENCER (for 1050)	$19.00
15. BLACK PATCH master w/DATA DISKS 1+2	$35.00
16. SUPER PILL w/o case	$25.00
17. SIO Amplifier	$39.95
18. QUINTOPUS/QUINTOPUS II (Switchable Ports)	$39.95/$59.95
19. XE551 Enhancer	$29.95
20. Power Plus memory upgrade (256K or 320K)	$99.95
Lots of used equipment...cheap...call!	
VERY LIMITED—Remote IBM type keyboard with interface for Atari 8-bit computers...complete!	$99.95

Right On Target

David Plotkin

To all my avid readers, my apologies for having missed last month's issue. It wasn't intentional, it was just that the pressures of life around the end of 1989 did not permit time for writing this column, though heaven knows I tried.

As I mentioned in my last column, I moved, and as I predicted, it was a horrendous job getting everything untangled. But also as predicted, labeling all the cables worked wonders, and the system went back together quite well.

Cleaning Out the Computer Room

In fact, I discovered that some of the parts of my system were not needed any longer, and they have been retired.

The first thing to go was the external disk drive switch. This was in place so I could switch between my 5.25 inch drive (which is also history) and my normal 3.5 inch drive.

I don't use the 5.25 inch drive any longer, primarily because I don't write the "Mac and PC" column for STart magazine any more, and thus have no reason to load up PC software any more. I actually own a PC, and had the foresight to buy it with a 3.5 inch drive, so that I can use 3.5 inch disks on both machines.

I also got rid of my RS-232 switch, which let me go between my modem and another serial cable. The other serial cable was in use to transfer files between my portable and the ST. My new portable has a 3.5 inch drive, so that bit of hardware is no longer needed either. Unfortunately, the Atari disk drives are only 720K, so I need to specially format the PC 3.5 inch disks, which are capable of handling 1.44 meg.

I was surprised as heck to find out that the disk drives for the TT are *still* 720k—here you have a most powerful machine, using old drive technology. But then, we have to remember Atari practically had to be coerced into boosting the TT processor's speed to 32 Mhz from the paltry 16Mhz it was originally. You have to wonder whatever happened to the kind of forward thinking that brought up the original ST.

The final bit of hardware that got retired was a printer switch box that enabled me to connect up both my ST and my Amiga to my printer.

As it turns out, the Amiga has been gathering dust in complete disuse for several years now, so I haven't even bothered to set it up in the new house—although that may change, as there are some incredible new games coming out for it (as Dave Small says, it's a *great* game machine). No need for a printer connection, though.

Emulators and Accelerators

There has been a surprising amount of news on the hardware front. Surprising because the news is from third party vendors, not from Atari, who as of this writing still does not have FCC class B certification on either the Stacy or the TT.

In fact there is a rumor that the Stacy is being redesigned to be smaller, lighter, use less power, and meet FCC standards. If true, all I can say is "hooray!"

I have a Stacy, and don't use it because of the lack of battery option and the extreme weight. Instead, I prefer my TI Travelmate 2000, which uses an 80286, has a 20 meg hard drive and VGA and weighs 4.4 pounds. It's also 8.5 x 11 and fits rather easily in my briefcase.

The interesting thing about the Travelmate's monochrome screen is that it is 640x400, 16 shades of grey. Hmmm, these specs sound like they could work real well for the Stacy. How would you feel about a 4.4 pound Stacy portable that could do *both* color (16 shades of grey) or monochrome (remember the 640 x 400 resolution). With a 20 meg hard drive, such a device could sell (with a meg of memory) for well under $2000. Atari, are you listening?

New Spectre

Dave Small should have released the next incarnation of Spectre, version 3.0, by the time you read this. There are lots of changes, including the ability to support 68030 accelerators and use the 68882 math coprocessor.

This is real good news to Mac emulator fans, since the Mac just screams with a 68030, especially running at 32 Mhz.

Some rather neat memory tricks have been done to allow the 68030 to achieve maximum speed, although some of these tricks may have to be disabled through software for program compatibility reasons.

Just remember that using a 68030 will mean that some programs won't work.

Fast Technologies Steps Up to the Plate

As if this wasn't enough, there is word Jim Allen of FAST Technologies also has a 68030 accelerator ready to go to market. It is a completely different design, and it remains to be seen which product will offer the higher compatibility.

One thing is virtually certain—if past performance is any indicator, these guys will do their darndest to provide the best product they can. They listen to their customers, which can't always be said of Atari. But the TT looks like dynamite, so we'll just have to wait and see as these products reach the market.

There are hot and heavy developments on the PC emulator front as well. Specifically, the two remaining emulators (PC Speed and Supercharger) are getting upgrades to handle an 80286, with some rumblings of 80386 support in the future. The 386 news is the most exciting, because you can run both Windows 3.0 and DOS software in windows, with true multitasking.

Interestingly, Talon Technologies carries both products, although they are direct competitors, and Talon's not insignificant technological expertise is being used to bring side products to market for these emulators independently of what is being developed in Europe, where the emulators originated.

Well folks, that's about it for this month. See you next time!

ATARI'S MEGA/STE—INSIDE AND OUT

Bill & Pattie Rayl

Atari surprised developers and users by showing a new 16MHz computer called the Mega/STE at last November's COMDEX. There had been plenty of rumors of such a new beastie before its release, but everyone online from Atari emphatically denied its existence. Then came the unveiling in Las Vegas.

We've now had our hands on a Mega/STe for a couple months. Shipments of Atari's newest computer are already reaching dealers, so look for it at your local dealer.

Hardware

The Mega/STE comes in two basic configurations: a 1Meg version with no hard drive (according to Atari Canada) and a 2 or 4Meg version with hard drive (according to Atari US). The list price for the 4Meg version is around $1,800. For that price, you get:

16 MHz 68000 CPU
Detachable keyboard
Mouse
Blitter chip
4096 color palette
Stereo sound output
SIMM memory
TOS 2.02 with NewDesk
Double sided 3.5" floppy drive
50Meg internal hard drive
Built-in fan
Standard parallel port
MIDI In and Out ports
Cartridge port
DMA port
Two 9-pin serial (RS-232) ports
8 MHz VME bus
Standard SCC LAN port

All in all, that's quite an impressive list of hardware. And, the Mega/STE is quite an impressive machine. Basically, it's a marriage of the STe, Mega ST and TT in one affordable package. Gone are the STe's two DB-15 joystick ports and the Mega's internal bus (developers overwhelmingly voted for a VME bus instead). Otherwise, the Mega/STE has everything the ST and STe computers had and more.

All of this hardware is enclosed in the new TT-style case, which has been "affectionately" called the "wedding cake" design. Personally, we find the case design to be quite compact, sleek and refreshing.

A Closer Look

One of the surprises of this machine, at least for us, was the two serial ports on the Mega/STE. We did not expect them to be 9-pin male connections, since previous STs and STEs have all had 25-pin connections. The TT also has two 9-pin serial cables. A simple standard 9-pin to 25-pin adapter is all you need to plug in your old cable and modem.

The Mega/STE is more like its big brother, the TT, in other ways too. The SCC LAN port and VME bus also appear on the TT, and the TT also has the NewDesk built in (More on NewDesk later!) In fact it's probably as correct to say the Mega/STE is a 68000 version of the TT as to call it a souped up STe!

The detachable keyboard is, in a word, fantastic. It's the best keyboard we've seen for *any* computer both in response and feel. The function keys are raised, rounded keys that are easily distinguishable from each other by touch. The keyboard itself is "scouped," making long periods of typing effortless. As an added bonus, the 'F' and 'J' keys have a raised bump on them, so your fingers can easily find the home row if you're a touch typist. The '5' key on the keypad also has a raised bump on it. The action of the keys themselves is very good and the contact is solid.

Many people have wondered

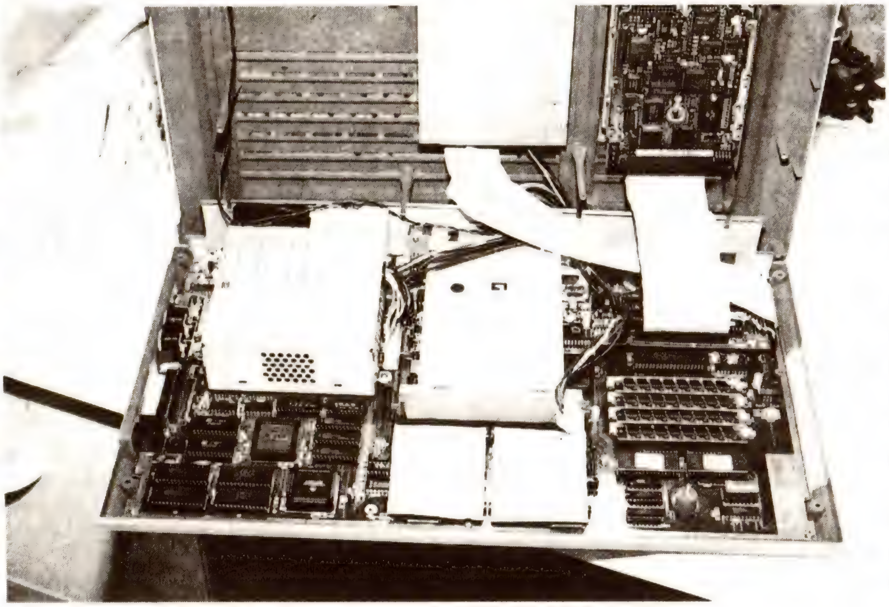
about the "pencil tray" on the front of the Mega/STE's CPU. This is really a depression that has a corresponding ridge on the bottom of the keyboard. By fitting these together, you can make your CPU and keyboard one unit. (Note: The keyboard does not snap into this depression; it merely rests in it.) The keyboard also has a slight depression, and this may be used to hold pencils and pens, but is more likely designed to accent the scouping effect of the whole keyboard.

The mouse/joystick port 0 is on the right-hand side of the detachable keyboard, while joystick port 1 appears on the left-hand side. Because of this, both ports are easily accessible.

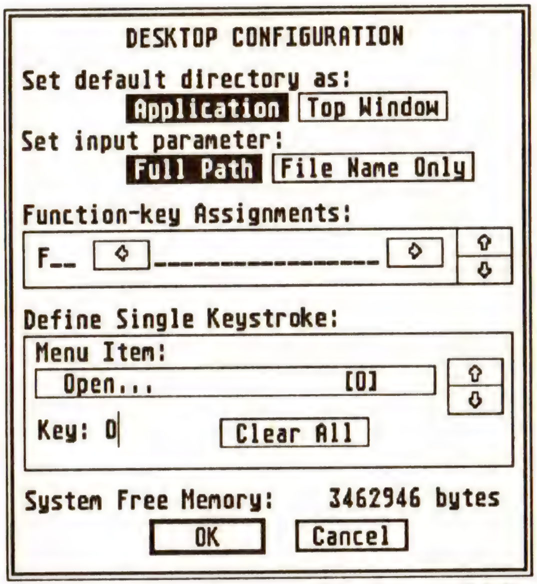
NewDesk

The most striking new feature of the Mega/STE, from a user's standpoint, is the new desktop that comes built-in to the computer. The additional features that have been added to the desktop are numerous.

Up to seven directory windows can be open at one time. This is not really very important now that Atari has added some very useful keyboard commands to the desktop. Holding down the Alternate key while pressing the key indicating a drive letter (such as 'A' or 'C') opens a directory window.



Clicking on a folder icon while holding down the Alternate key causes a new directory window to open that displays the folder's contents. This is handy for times when you want to copy files from a folder to its parent directory.



DESKTOP CONFIGURATION

Set default directory as: **Application** Top Window

Set input parameter: **Full Path** File Name Only

Function-key Assignments:

F__ ◇ ________________ ◇ ⇧ ⇩

Define Single Keystroke:

Menu Item:

Open... [O] ⇧ ⇩

Key: O

Clear All

System Free Memory: 3462946 bytes

OK Cancel

Pressing Control and a drive letter (such as Control-C) will cause a currently selected directory window to switch to displaying the new directory. With this feature, we've found that, at most, only two directory windows need be open at any given time.

You can use the cursor keys to scroll around directory windows! All options appearing in the drop down menus can have user-defined keyboard equivalents as well. We've re-defined many of the items to suit our own likes, like 'F' for Format Floppy, 'C' for Create Folder, etc. Function keys can be assigned to individual programs. By pressing a function key at the desktop, the corresponding program is executed.

Along with the ability to "move" files using the Alternate key while dragging them, Atari has added two related commands. Copying files while holding down the Control key allows you to rename the copy. Holding both Alternate and Control while copying does a file move and rename simultaneously.

There are even keyboard commands for switching resolution and printing the contents of a selected directory window!

Icons

Although not as customizable as NeoDesk or DC Desktop, Atari's new desktop does have a number of icons from which to choose. The largest selection is for devices, such as floppy or hard drives, CD ROM, laser printer, etc. You can, however, use any of these icons as file icons.

You can now place *any* icon directly on the desktop. For example, you can drag a folder icon onto to the desktop and open a directory window for that icon by double clicking it. This feature is most useful for placing program icons on the desktop. Then, you simply double-click these icons to execute the programs.

To remove an icon from the desktop, you simply drag it to the trashcan. You are presented with the choice of removing the icon, deleting the corresponding file or cancelling the operation.

Color Backgrounds and Windows

You can now set the desktop background color and pattern from the Set Colors & Style option. You are only offered eight fill patterns, but those are adequate. This option also allows you to set color and pattern for window backgrounds, as well.

Here, it seems Atari could have gone a little bit further. It would have been nice, for example, to allow setting the text color as well. Then users could choose black backgrounds with white text, etc. If you define your window background as full black currently, all the text in the window disappears.

Extensible Control Panel

Finally, we have a control panel that everyone should be happy with. With the new Extensible Control Panel, you select only those .CPX files that you want to use. You even get the option of making these files RAM resident or loadable from disk. No more memory waste!

The CPX modules that came with our Mega/STE include Color Setup, Configure CPXs, General Setup, Accelerator (Atari's Mouse Accelerator needed), Modem Setup, Printer Setup, Sound Setup and Window Colors.

The Window Colors CPX allows you to change the color of all pieces of a window—from the scroll bars to the close buttons. Sound Setup allows you to set bass, treble, volume and balance for the Mega/STE's stereo sound output.

The General Setup CPX contains, among the usual control panel options, the ability to set the CPU Speed. The options are 16 MHz with or without cache and 8 MHz without cache. The true 8 MHz mode makes the Mega/STE compatible with any time-critical programs for the ST. By default, the Mega/STE boots up in 8 MHz mode, but you can change this by saving the control panel settings.

With the new Extensible Control Panel, you are given the option of storing the CPX files anywhere you choose. We have them in a folder called CPX on drive C. Normal (.ACC) desk accessories can still be used by the system, but they cannot be loaded as Extensible Control Panel modules.

This new control panel is compatible with all ST/STe/TT computers and Atari says they plan to release it soon to all users via the online services.

Compatibility

For those of you who crave 16 MHz benchmarks, Quick Index numbers show the Mega/STE to be as fast as an AdSpeed-equipped STe. From a practical viewpoint, the Mega/STE runs circles around the older machines. Users of DTP and CAD packages will benefit greatly from the increased speed. The time it takes to ARC files is nearly cut in half!

So far, most everything runs just fine on the Mega/STE. PageStream shows a noticeable speed improvement at 16 MHz. STWriter saves ASCII text a lot faster than it used to. SuperBase and LDW Power are faster at calculations and searches.

We tested a number of games. Iron Lord works fine and was considerably faster. The real killer, though, was Pinball Wizard. Even at the slowest speed setting, the ball was cruising so fast you could hardly keep up with it! Switching to 8 MHz mode made the game playable again.

Joppa FAX seems to have a problem with the new serial ports. It functions fine as a modem on port 1, but has problems sending FAXes. Plugging the FAX modem into port 2 solves the problem. Joppa is aware of this problem (it seems to happen on the TT, too).

Hotwire runs, but doesn't work properly when booted from the AUTO folder. The CodeHeads have already announced an upgrade.

We've run into a few public domain and shareware programs that don't run on the Mega/STE. Most of these are graphics demos or games that won't run on the STe, either. The recently released MIDI Maze II from Germany works on a normal STe, but locks up after a few minutes of play on the Mega/STE, whether in 16 MHz or 8 MHz modes.

The Bottom Line

The Mega/STE is, in our opinion, the best overall computer for the home and small business user that Atari has ever produced. With proper marketing, this machine could win hands-down against the Mac Classic and IBM PS1. Atari has once again moved into the position of having "Power without the Price."

Menu Plus "Program Launcher & More"

Menu Plus

Menu Plus is a full featured "Desk Top" enhancement that allows you to quickly launch (run) any program on your hard drive or floppy disk. Smart menu system allows you to set up programs by category (Main Menu) and sub-category (Sub-Menu). This allows you to highly organize all of your programs. But Menu Plus is much more than a program launcher, just read the features below.

BYTE Magazine Answers Back

Tim Holt (ACCEPT)

A few weeks ago, I submitted a letter that was making the rounds on the BBSes to the editors of BYTE magazine. In essence, the letter asked why the Atari platform was ommitted in a recent article about desktop publishing. I didn't think I would get a response, but I did. Here is the entire text of that letter:

January 8, 1991
Timothy Holt, President
ACCEPT
10953 Yogi Berra
El Paso, Texas 79934

Dear Mr. Holt:

Thanks for writing! I always appreciate hearing from readers—even when they are not happy with BYTE.

I can understand your frustration. The Atari is a very nice platform that pioneered several key areas the rest of the microcomputing world is only now starting to pay attention to.

Believe it or not, my first "real" computer was a very early Atari 800. I still have that puppy on a shelf at home, and drag it out from time to time for the sheer fun of it.

I got my start in computing with that 800. A friend and I founded "Shelter Software," a tiny company that wrote and sold various programs for the Apple and Atari computers: I was the staff's Atari programmer.

So please don't assume there is any anti-Atari bias here at Byte. It just doesn't exist.

In fact, a quick search through the BYTE archives shows me we've covered Atari about every month in 1990, about the same coverage we had in 1989, too. Now, these weren't splashy cover stories—they tended to be references inside other articles.

That might not seem like much, and I fully realize that your letter was to inform me that our coverage was still inadequate. However, BYTE covers the Atari far, far more than any other non-Atari-specific magazine. That ain't chopped liver.

Despite the fact that less than 1 percent of BYTE subscribers have Ataris, we feel the Atari is innovative enough to have covered it in literally every section of the magazine. It's been a part of What's New. It's been in our columns. In reviews. Everywhere. I am proud that we already cover the Atari as much as we do. And will continue covering it appropriately: I like the fact that BYTE leads all non-Atari-specific magazines in this area, and want to see it continue.

But, given limited editorial space, we have to draw the line somewhere. And that "somewhere" means that occasionally, we have to omit coverage of the Atari in areas that it might seem to belong. There's a market reality here that I can't ignore: less than 1 percent of BYTE subscribers own Ataris.

Why is that? Ask Atari. If they'll get on the case and give the Atari the push it probably deserves, increasing its use among BYTE readers, then for sure we'll increase our coverage even more. But that kind of push can ethically come only from Atari—it's not Editorial's job to promote a product. We report; the companies promote.

So in sum, I would like to reiterate my understanding of your position: I honestly do sympathize. As a former Atari fanatic, I wish it enjoyed the success of the IBM PC.

But I also hope you'll understand my position and see the "half full" nature of BYTE's coverage, rather than seeing it as "half empty." A careful reading of BYTE may turn up far more coverage of than you may be aware of.

In any case, we'll do our best to give the Atari its due whenever and whereever appropriate.

Thanks again for writing!
Best,
Fred Langa, Editor-in-Chief

Irwin Brooks (LACE)

As some of you might already know, the October issue of BYTE magazine ran a comparison of desktop publishing (DTP) systems for the two major PCs. The IBM compatible using Ventura and Macintosh using PageMaker were highlighted. This was very curious indeed, since your and my favorite computer was suspiciously absent.

The Atari ST has held its head high in the DTP arena. So much so that Atari has successfully bundled a mono Mega 4 system with an Atari Laser Printer and DTP software and sold them as a system for this very purpose. Premier DTP software is readily available for a variety of applications in price ranges from as low as $59 to over $450. Calamus, PageStream, Timeworks DTP and other software titles come to mind as excellent and inexpensive (when compared to the equivalent IBM/Mac products) DTP programs. Aftermarket hardware products like the full page viewing Viking Moniterm Monitor and the MiGraph hand scanner are just two of the tools available that increase the effectiveness and usefulness of the Atari DTP alternative.

Atari DTP

The magazine you are now reading was created with an Atari DTP system. And the quality is here so the quality must be there—in the Atari DTP system.

The overall cost is the *real* Atari DTP advantage. When you add up the complete system price of the Atari, Macintosh and the IBM, the Atari is the hands down winner. I will concede one point here though; the DTP software choices of the big two are more numerous than they are for the Atari. However, at $500+ each how many DTP titles do you want to purchase?

So the nagging question in all this is: why did BYTE magazine leave the ST out of this DTP comparison? With such a strong capability and availability for DTP? That is the question that inspired a letter writing campaign sponsored by ST Report (a weekly on-line magazine).

Letter-Writing Campaign to BYTE

The suggested letter as it appeared in ST Report was addressed to Mr. Langa, managing editor of BYTE magazine. The letter extolled the merits of the Atari line of computers and expressed regret the ommission of the ST from the DTP comparison. Since I wholeheartedly agreed with the contents of the letter I promptly sent it off to Mr. Langa at BYTE. His reply was received within the week. (Mr Langa must have taken keys in hand as soon as he got my letter! Aren't computers wonderful?)

You should understand here that I do not have the luxury of owning an Atari DTP system; but like every other Mega/ST owner, I take comfort in the fact that with a few costly additions I could. (A laser printer, a hand scanner and, of course, PageStream running on my dream TT would be extremely nice.) For now I'll settle for my DTP software and a 24 pin printer that did a bang-up job of printing a fine looking Christmas letter, flyers, labels and other quality work. All at a price that is not beyond the reaches of the average computer user.

The Reply

Mr. Langa's reply was very diplomatic and consiliatory. He explains that his first computer was an Atari 800 which he still has and occassionally enjoys.

In my opinion, up to here Mr. Langa is probably right on target. However, the next part in the letter I don't like. I'll quote.

"There is a market reality here that I can't ignore: less than 1 percent of BYTE subscribers own Ataris.

"Why is that? Ask Atari. If they'll get on the case and give the Atari the push it probably desires, increasing its use among BYTE readers, then for sure we'll increase our coverage even more. But that kind of push can ethically come only from Atari—it's not Editorial's job to promote a product. We report; the companies promote."

Reporting or Promoting?

This position brings up an interesting point. Is unbiased product comparison reporting or promoting? I strongly disagree with Mr. Langa implying that including the Atari DTP system in the October BYTE comparison would be promoting the Atari systems. That argument is no more valid than saying that IBM and Macintosh computer were promoted by their appearance in the BYTE report.

Instead, what I do see happening here is a deliberate attempt to narrow the focus of a multi-platform computer magazine to reporting on the top two systems, IBM and Macintosh. This reader alienation, whether 1 percent or 25 percent, further reduces the percent of BYTE subscribers with other types of computers. In addition, it creates a very myopic-visioned reader. While the computer world will continually evolve, the BYTE reader will be unaware of improvements and advancements from the other computers as long as they do not cross that PC/Mac boundary.

Going with the Flow

In the short term this "top dog" coverage policy could have benefit by gaining additional readers at the expense of the few alienated computer users. However, it can also prove to be self destructive. You see, computers, like other things, go in and out of vogue.

When the next new and faddish computer comes into dominance, BYTE will have to change their coverage at the risk of subscriber bailout or they will slowly blow away in the wind. If a broad scope of reporting and coverage were offered instead, no changes would have to be made and no loss of readers would result. Besides, users subscribe to computer specific magazines in addition to BYTE subscriptions anyway.

So Mr. Langa, I hope this is not BYTE's policy. I truly believe that it could cause an early end to one of the all time best computer magazines ever published. I hope that future reports are given in an unbiased and unfavored manner and that the global BYTE that I remember of yesterday will be the BYTE of tomorrow.

- RUNS 286 AND 3.0 WINDOWS
- BUILT IN BUS FOR FUTURE EXPANSION
- SEPERATE 5V DC SUPPLY
- INSTALLATION MANUAL
- 12 MONTH WARRANTY
- SHIELDED ABS CASE (FCC CLASS A CERT.)
- ONLY 6.25 X 7.25 X 2.25 IN.

SUPERCHARGER OPTIONS SOON TO BE RELEASED

SCplus/NET - Full networking board
- Connect DOS and TOS programs or files under Novell™ etc.
- Transfer rates of 2.5 Mbits/sec.
- Plugs into existing expansion connector with no soldering required.

SCplus/286 - Turns SuperCharger into a full 286 co-computer
- Runs at 12 MHz on a pure AT chip set
- Comes with 1 Meg of RAM expandable to 4 Meg - full EMS support
- Contains true AT expasnsion slots - accepts ANY expansion card
- Provision for an 80286 co-processor
- Plugs into existing V30 socket with no soldering required.

SCplus/386 - Turns SuperCharger into a full 386 co-computer
- Runs at 16 MHz on a pure 386 chip set
- Comes with 1 Meg of RAM expandable to 4 Meg - full EMS support
- Contains true expasnsion slots - accepts ANY expansion card
- Provision for an 80386 co-processor
- Plugs into existing V30 socket with no soldering required.

TRUE MULTI -TASKING

Connect several superchargers together to run different programs concurrently

HOT KEY

Allows TOS/DOS switching **without** rebooting.

TOOLBOX

Programming interface to allow programmers to develop their own background tasks.

LAUNCHER

Execute DOS programs directly from your TOS window.

SuperCharger - Only

$450

V1.4 Upgrade Kit - $19.95

The Great Piracy Questionnaire

Robert Pecora (CACE)

After reading several articles this past year on software piracy, the thought occurred to me that maybe part of the problem is not that there are so many dishonest people out there, but people just aren't educated about software piracy.

So, in order to better bring the problem to life for each user, I sat down and wrote the follow questionnaire covering several real-life situations. I hope that for each of us, it will stir the imagination, as well as the conscience.

The following are situations that you may encounter as a computer user, followed by questions about the situations. The results of these questions will define whether you are an upstanding and responsible member of the computing community or you need to clean up your act!

1. *A friend approaches you and says, "For being such a good friend and helping me with that computer problem I had the other day, I'm letting you have a copy of Calamus." You then:*

A. Say, "No, thank you. You keep it."

B. Accept the program and add it to your library of marvelous titles.

C. Accept it and format over the diskette when you get home.

D. Accept it with the idea that you probably will not use it, but keep it "just in case" you decide to buy it later.

2. *You are on a bulletin board and are scanning the FILES area for programs to download when you notice that some of the files are commercial pirated programs. Do you:*

A. Download the files for your use, telling yourself the responsibility belongs to the BBS sysop?

B. Leave a message to the sysop of your suspicions and names of the files?

C. Just download the upgrades to the programs that you already own and legally purchased?

D. Upload a Virus program to the BBS?

3. *A friend gives you the telephone number of a "pirate" bulletin board in the area and of all the great new commercial programs that you can get for free! Do you:*

A. Call the bulletin board and download all of your favorite programs before the law finds out and shuts it down?

B. Notify the authorities?

C. Download your favorite files for yourself, then notify the authorities?

D. Ignore the fact that there is a pirate BBS in your area.

4. *You owe a friend a favor and the friend asks you for a copy of a commercial or copywritten program that you purchased. So, you:*

A. Make him a copy of the program and promise yourself that it will be the last time you make an illegal copy.

B. Tell your friend that you don't think that would be the ethical thing to do.

C. Make him a copy as a backup disk since he promised to purchase the program as soon as he gets the money.

D. Give him a copy because he is poor and can't afford to buy any good software.

5. *You are at a computer festival/show and are delighted at all the new stuff for your computer. You are just about to buy a program from a vendor for a good price when a friendly guy takes you aside and says "Let's pitch in together and buy the program, then I'll make us both a copy. It'll be like getting it half-price!" Do you:*

A. Agree and do as your new friend proposes?

B. Tell him "No offense, but I'd rather not."?

C. Go see if you can find a third person to go in on the deal?

D. Try to get it for free from your friend who already has it?

6. *You download a "shareware" program from a local bulletin board. The document file asks for a donation of $20 "if you like the program and use it." So, you:*

A. Send the $20 to the author.

B. Decide it's not worth the $20 and send the author $10 instead.

C. Decide that you don't want it, but keep the file in case someone else wants it.

D. Use it and promise yourself to send the money later when you are not so busy.

7. *You go to a user group meeting and at the meeting everyone is trading copies of the hottest game on the market! Do you:*

A. Take a copy because everyone else is doing it?

B. Take a copy because you did not actually make the copy of the disk yourself, so you aren't guilty?

C. Refuse a copy and mention the activity to the club president?

D. Quit going to user group meetings?

8. *You buy a copy of a commercial program and one day discover that the diskette no longer works in your computer. A friend offers you a copy of the program that he pirated. What do you do?*

A. Accept the pirated copy from your friend?

B. Refuse the copy and send the original diskette to the publisher for a new disk?

C. Pay your friend for replacing your bad diskette?

D. Go out and buy the program again from the local software store?

9. You are the system operator of a local bulletin board system. You get a message one day from a user that there is some pirated software on your BBS. Do you:

A. Forget about it? You didn't put them on there! Someone else did!

B. Take the software off the BBS and use them yourself.

C. Remove the programs from the BBS and discard them? Then, send a message to the uploader warning him of the consequences of doing it again.

D. Try to encourage the practice so that everyone will like your BBS more than all of the others?

10. You have just sold some legitimate commercial software that you purchased to a friend. What do you do with any backup or hard drive copies? Do you:

A. Give the backup copies to your friend and delete the files from your hard drive?

B. Keep the backup copies in case you need them someday?

C. Sell the backup copies to someone else and make more money?

D. Continue to use the H.D. copies

End of Test

Now, let's find out how you did on the test. The answers for the questions are as follows:

1. The correct answer is "A." "C" may also being an acceptable answer when confronted with a person who insists that you have it and doesn't understand the meaning of "NO." However, you will have the appearance of being a pirate to those who know of the exchange.

2. If you picked "B," you are correct! Don't be fooled by "C." Unless the company where you purchased the software offers free upgrades, you are obligated pay the upgrade price required by the company or vendor.

3. This question has two possible answers. If you are the type to not sit idle while a crime is being committed, you may decide to choose "B" and report the activity to the authorities or call the Piracy Hotline set up by the Software Publishers Association. However, if you are the meeker type and don't want to "get anyone into trouble," you may choose "D" and ignore the BBS and discourage its use among your friends.

4. "B" is the correct answer here. With "A" and "C" you are only fooling yourself and if you are that easily fooled, I have some swamp land for sale. "D" is a two-edged sword, used by both givers and takers. The truth is; being generous with stolen pirated software does not make you a good Samaritan.

5. The correct answer is "B." Let's face it. Going together with a friend and sharing the price of software is dishonest. If you get to keep the original disk does that make the other guy the thief or are you both half-thieves? The fact is that if you made the bargain to share the price of the software, you share ownership 50% by the deal struck. This makes you a half-thief which is a whole lot like being half pregnant! These mind games that we play make it all the harder to run a clean software library. Pretending to not understand the legality of the act is denying the truth to yourself and is no excuse for theft.

6. "A" and "C" are proper choices for this question depending upon whether you like the program or not. Since the software authors want the program to get around to as many people as possible, whether by downloading from a BBS or from a friend, "C" is acceptable as long as you do not use the program yourself. "D" is a trap that many of us tend to fall into. We all procrastinate or "put off" things and forget about them. Self-discipline is in order here. When you decide that you like a shareware program, *immediately* write the check and put it *in the mail!* There! You *did* it and it's *over* with!

7. Let's go for answer "C" for this one. If the activity is not condoned by the user group and the club officers are unaware of the activity, tell them about it and state your misgivings. If the activity is open and everyone knows it, it would be better to choose "D" and not be a part of a "Den of Thieves." Join another user group or create your own to establish good ethical standards in your community. It would probably also be a good idea to contact Bob Brodie at Atari about this club's practices.

8. The best answer would be "B," although "A" is OK as long as it is the same version as the copy that you already own. Many software vendors replace damaged diskettes for free or a small fee so if in doubt, go "B."

9. The answer is "C." Even though you did not put illegal copies of commercial software on your bulletin board, you as the SysOp are legally liable for any pirated software on it. The authorities can confiscate you computer hardware, fine you in court, make you pay damages to the software developers and more! Don't fool yourself here. The lesson you learn can be very expensive.

10. "A" of course, is the answer. When someone buys a legal copy of a software title from you, he should get the original and he legally is entitled to owning a backup copy now and not you. You should, therefore, delete any copies that are in your possession no matter where they may be stored.

Well, how did you do? You may want to know how this test is scored before you can decide how well you've done. Unlike other tests that allow you to get some of the questions correct to pass, if you have answered *any* of the previous questions incorrectly, you are a *Software Pirate!* Sound a little unfair you say? Think about it for a minute.

Think about how unfair it would be if you were working for someone and he refused to pay you for your hard work. If this were to happen to you, you would find no deaf ear to your pleas of injustice.

Why should it be any different for software developers? The fact is, it isn't any different! Maybe because of the fact that it is *so easy* to steal software, and not many people so far have been prosecuted for piracy, pirates have the feeling that "If I can't get caught, it's OK."

Computing should be an activity governed by good ethical conduct. For the Atari ST community, it is much more vital that we understand the obligation that we are under.

We want respect from all other computer communities, but do we earn any respect?

We want more and more titles to be made available in our computer format, but do we encourage it by stimulating the market demand?

We want more users to join the Atari ranks, but do we foster a good healthy environment for growth?

We want other ST users to be our friends, but do we have to make friends by stealing?

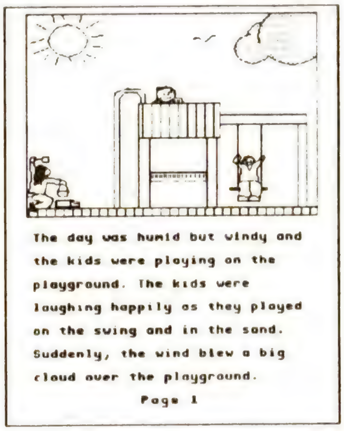
The Atari ST is a powerful and pleasurable piece of workmanship. Let's be the first to give it and the people who *really* support it the respect and support that they deserve.

For your budding journalist:

KIDPUBLISHER *PROFESSIONAL*

a desktop publishing program for young writers

- ☆ publish your own illustrated stories, posters, etc
- ☆ four built-in font styles, and parent or teacher can create a fifth
- ☆ extensive drawing program
- ☆ title page, LOAD options
- ☆ word wrap feature, underlining, and mouse control of cursor



The day was humid but windy and the kids were playing on the playground. The kids were laughing happily as they played on the swing and in the sand. Suddenly, the wind blew a big cloud over the playground.

ANSWERS, TIPS AND RELEVANT INFORMATION

Paul V. Alhart (AFED)

Call Waiting vs. Telecommunications

Some time ago, at the insistence of my wife and two teenage daughters, I subscribed to call waiting.

This is an option offered by the phone company that lets you know if someone is trying to call you while you are already on the phone—kind of like having a two line phone. You are signaled of the second call by a short tone.

While this tone is rather unobtrusive during a voice conversation, it is murder to a modem link. Your modem will think that the carrier has been lost and will immediately hang up.

Imagine you have almost completed a 20 minute download (long distance) and your friend calls you to chat. Oops. No successful download and maybe no more friend.

There is an answer to this problem. Another option offered by the phone company is cancel call waiting which allows you to disable call waiting on a call by call basis. In my area this is a separate service.

I was tired of limiting my modem use to 1 or 2 in the morning to avoid getting bumped off line, so I ordered cancel call waiting.

More Problems

Now, all I needed to do was tone dial 70# before placing my call and I would not be interrupted by the call waiting tone.

I couldn't wait to try it out. I booted 1030 Express ver.2.1 and started dialing. Oh Oh.

Express would not even let me enter # using the manual dial option. I could include # via the menu dial option, but it didn't generate the proper dialing tone. It dialed a 3 instead.

Let's Try Something Else

Not one to give up, I started trying every key on my Atari till I got one that gave the right dialing tone. The ^ key was the one that worked. Now every number in my dial list starts with 70^ to cancel call waiting.

Still, this won't work for the manual dial option of 1030 Express unless you make this sequence your Long Distance code as described below.

Not long ago I upgraded to a 2400 baud modem and started using 850 Express ver.3. With 850 Express # dials properly. You do not have to substitute the ^ key. You still can not directly enter # using the manual dial option, but there is a way around this.

Make 70# your Long Distance code. Then if you need to dial manually, precede the number you are dialing with ! which will cause your cancel call waiting code to be dialed.

Note

There are several versions of 850 Express and 1030 Express, as well as several other terminal programs to choose from. Also, some phone companies have different options and different codes for using them.

You may have to experiment a little for your particular situation, but you should *never* have to lose a 20 minute download or a good friend because of call waiting.

The ATARI XL/XE Commercial Software Drought is OVER !!!

SOFTWARE INFINITY proudly presents its Brand NEW *KE-SOFT Series* -- the First Major ATARI XL/XE Commercial GAME Releases to be produced for the North American market since 1987 !! Eleven spellbinding super-sophisticated 1991 GAMES on 9 economically-priced premium quality Disks ! Already Bestsellers in Europe -- newly enhanced to revitalize your XL/XE !

Every GAME in *SI's KE-SOFT* line boasts ultra-realistic & colorful state of the art high-resolution animated graphics, outstanding music, and lots of clever surprises. Many also feature digitized speech & sound effects, high-score saves, a password system to skip levels, and a capable Editor to near-effortlessly create your own new screens. Handsome and comprehensively detailed printed Instruction Manuals are written in clear, easily understandable English. All 11 superior 64K *KE-SOFT* titles are endlessly entertaining to novice and experienced ATARI GAMErs alike.

$10.50 GAMES
2 or more for $9.50 each !

ZADOR

Turn over all 144 Chinese-symbol tiles on the game board by matching singles to make pairs that are solely connectible by an invisible line (which can't cross any active tiles or be bent more than twice)! A high-powered Mah-Jong variant with 20 levels and useful "prompt next pair" option.

DRAG

Guide intrepid Drag the Frog past deadly mines, exploding bombs, & falling rocks in a treacherous underground lair, to collect diamonds before his air runs out! 50 screens of Boulderdash-type arcade action.

SOGON

Navigate your sturdy forklift around the 50 barrier-filled floors of a skyscraper to relocate large boxes one at a time to waiting storage bays. Once you've moved a box to any perimeter-wall or partition, you can't pull it back! Devious chess-like strategy; vital backup-one-move function.

ZEBU-LAND

Help Zebu engineer the escape of his 3 brothers from a 50-level labyrinthine world of revolving doors and blocked passageways (move wall-segments aside to reveal exits)!

DREDIS

At last -- the unparalleled mind-boggling Commercial ATARI XL/XE version of the arcade champ Tetris! Ultra-challenging puzzle, multiple levels of difficulty, one- and 2 - player modes.

Order 3 or more *KE-SOFT* GAME titles Mixed ($14.50 & $10.50 items together) -- subtract $1.50 from the price of each !

BACKUP COPY of any GAME Disk is $2.00 if purchased at same time as Original; $ 4.00 if ordered later.
Great *KE-SOFT* GAMES *DEMO DISK* with playable sample screens -- FREE with any 2 GAME Disks, or $4.00 separately.

SHIPPING And HANDLING is always just $3.00, regardless of quantity of *KE-SOFT* products ordered.
NO State Sales Tax is due on any SI Disk.

$14.50 GAMES
2 or more for $12.50 each !

TECHNO NINJA

Voyage to a hostile alien world to reclaim your home planet's ultimate source of power! Encounter 10 perilous landscapes (cities, bodies of water, spaceships, etc.) on 100 screens. Gain energy, earn up to 8 extra weapons, battle over 50 varieties of monsters. Enhanced density disk.

CULTIVATION / CHROMATICS

Two brain-busting puzzlers on one disk!
CULTIVATION: Put away your Farmer's Almanac -- this game's about the strategic "cultivation" of matching symbol-blocks, push together like singles in the proper order to make pairs and clear your choice of 100 screens on 10 levels.
CHROMATICS: This mesmerizing 3-level Tetris-style contest utilizes 3 - 5 different colors instead of shapes; rotate the hues of blocks falling into a well to place 3 or more same-colored blocks together at the bottom.

OBLITROID

As the last Star Warrior of Xyros, you must track the evil Tindalos to his underground dungeon and engage in mortal combat! Find special weaponry to survive never-before-seen dangers on 4 Worlds comprising 140 screens; invaluable stop/continue mode. Extensive Manual is packed full of maps & tips. Enhanced density disk.

TOBOT / BROS

Two invigorating arcade adventures for the price of one!
TOBOT: Using his versatile laser gun, our robot superhero must escape a spooky 50-room castle filled with angry spiders!
BROS (Super Mario Brothers - inspired): Traverse 8 Worlds with 4 Underworlds each to rescue your brother from a hidden castle -- collect mushrooms to get power or shots, gather coins to earn additional lives, and vanquish legions of monsters!

C-manship

COMPLETE

Learn to program your ST in C!

A Taylor Ridge Book

"Clayton Walnum not only succeeds in teaching the C language, but also explains the intricacies of GEM better than I've seen it done anywhere."
--**David Plotkin**

"Great stuff! C-manship is a terrific way to learn the C language in general and ST programming in particular. Highly recommended!"
--**Charles F. Johnson,**
Codehead Software

Everything you need to know to program your ST in C, from the basics of C to the writing of a full GEM application with windows, dialog boxes, and menu bars. Desk accessories and built-in resources, too!

To order, send $19.95 plus $3 postage & handling (Canada $4, Overseas $6) to the address below. The disk version, which includes all programs on two single-sided disks, is $10 extra. CT residents must include 8% sales tax. Visa and Mastercard accepted.

C-MANSHIP COMPLETE

Bill Rayl

Practically everyone who has owned an Atari computer for more than a year has heard the name Clay Walnum. Clay's C-manship articles in ST-Log were read and looked forward to by many beginner and intermediate ST C programmers.

Now, a little over a year after the demise of ST-Log, Taylor Ridge Books has released C-manship Complete by Clayton Walnum. This 400+ page book contains all 31 of the C-manship articles that appeared in ST-Log over nearly a four year span.

Learning C

There are many other books out there that teach C programming, but none of them directly support the Atari ST. C-manship starts with the basics, teaching you C with an ST perspective.

The book focuses on Megamax and Laser C, but the examples are easily ported to Mark Williams C, Sorzobon C, etc. I use both Laser C and Mark Williams and have had no problems using either with most of the supplied source code.

Following the book from Chapter 1 (Some Basics) to Chapters 27-31 (A Complete GEM Application), C-manship shows you everything you need to write sophisticated GEM or TOS/TTP programs. Individual chapters handle such topics as using the file selector, desk accessories, simple animation techniques and more.

Each chapter has at least one accompanying type-in program, and many have more than one complete (and often useful) program. The book's six page Index is very well done and makes finding a specific topic very easy.

Because the book is a compilation of monthly articles, C-manship Complete is very much a tutorial. It is organized in such a way that each new chapter builds on the previous. All in all, C-manship Complete is the best C programming class available for the ST... and you don't even have to leave your home to attend.

If you're just starting to learn C or want to learn, this book is a must have. Intermediate and "expert" level C programmers will, no doubt, also want this book on their reference shelf.

I was one of many ST-Log readers who read Clay's original articles with great interest, having just started programming in C around the time the C-manship articles began.

Unfortunately, I missed a number of the issues. Cmanship Complete gives me all those articles in one spiral-bound volume.

Get the Disks!

For those of you who don't want to type in all those sample programs that accompany each chapter, Taylor Ridge has the solution. The C-manship disk pack contains two single-sided disks with the source code and executables for each chapter. The complete source code and executables for Clay's MicroCheck ST is also included. This full-blown GEM application is, by itself, worth the price of the disks.

I personally believe you can learn a lot by typing in the source code yourself and trying to debug it to find your typos. At times, though, this can be a bit tedious—especially when the source code for some of these chapters is over 13K. Save yourself a lot of time

eSTeem PILOT

Peter Loeser (TEAC)

Back in 1960, Dr. John Starkweather of the University of San Francisco developed a special "authoring language" called PILOT.

PILOT was an acronym for Programmed Inquiry, Learning Or Teaching. It was a special programming language designed to be used by educators and students to develop interactive, conversational dialogs for computer-based educational programs. It was fairly easy to learn and has enjoyed great success in its various guises since it was first released. For example, many of you may be familiar with the popular 8-bit version that was released by Atari.

PILOT is now available for the Atari ST in its newest version called eSTeem PILOT, thanks to the efforts of programmer Tom Nielson. While attempting to retain much of the ease of use of the earlier versions, Nielson's eSTeem PILOT adds many new dimensions to the original text based version. Before we continue, it is important to emphasize that PILOT is a programming language, not a completed program.

Like BASIC, LOGO, or any programming language, it is a tool to allow the user a way of writing programs for the computer. It is an excellent "authoring tool" for creating customized programs to use in Computer Aided Instruction, training, testing and evaluation, simulations, and for repurposing or combining commercial Laser video presentations into your own programs. For example, you could write a CAI module on "The Diary of Anne Frank" and include screens from the movie's Laser Disk.

With eSTeem PILOT you can use graphic images within your modules drawn with Degas, Easy Draw, or other similar ST drawing programs. You can place graphic, mouse-controlled pointers that can locate hotspots (hidden "Hypercard-like" buttons) to access dialog boxes, plus switch between split screen text and graphic displays.

You cannot, however, create stand alone programs that will run on your ST without first loading them with the PILOT program.

The main PILOT program is completely configurable with three levels of use: Manager, Author and Student level. You can enter names of users and set their level of access. Features such as access passwords, automatic logging of user names, title screens, operational modes, user access criteria and autoloading can easily be configured at the Manager level. Creating and modifying instructional modules is done at the Author level, while Students are just allowed to run modules.

This is not a program recommended for beginners without previous programming experience. Although it comes with a well written manual, eSTeem PILOT would not be easy for beginners to work their way through without either computer experience or help from somebody that has that experience. The manual is written as more of a resource than a tutorial.

I'd say that if the previous paragraph confused you, you will experience some difficulties learning to use eSTeem PILOT. But I also feel that if you do learn to use it, the rewards will be considerable.

In a conversation with author Tom Nielson, I learned he is in the process of writing PILOT modules that teach the user how to program in PILOT. He has also started a PILOT section in the Atari ST Roundtable on GEnie (Category 29, Topic 7). He hopes that, eventually, teachers using PILOT will share their learning modules with each other, much the same as Mac users share Hypercard stacks.

PILOT is also open ended. It already has the ability to produce multimedia educational units, including Laser disk interface, access and control, but also has the potential to use CD-ROM drives and the ability to communicate with virtually any type of hardware you wish through the ST's built-in RS-232 serial port.

Practically speaking, if you are a teacher, eSTeem PILOT will allow you to make custom lessons, tests and learning programs. You could also teach programming with it. The modules can be written on any word processor capable of saving ASCII files. If you are willing to spend the time necessary to learn PILOT, and you and your students have access to ST computers, this program could be a very valuable teaching tool for you.

Born Again Flowcharts

Robert C. Arp, Jr.

The Birth of a Concept

Long long ago, in the early days of computer programming, when bending the primitive intelligence of computers to the will of men was more of an art than a science, those involved with computer programming instruction tried to establish conceptual formulae with which to impose a mathematical type of discipline upon the new murky profession. One of the mantras invoked by many instructors was "flowcharts."

The Rapid Decline and Fall of a Doctrine

I doubt that any of the newer computer texts preach the "no program can begin without a flowchart" dogma; this admonition was relaxed slightly after many programmers admitted that they did indeed write programs without flowchart "guidance."

You can see a more modern version of the "flowchart" doctrine in Radio Shack's "Understanding Computer Science" (the first volume), which sells for something like four bucks. The ideas about computer programming presented in the Radio Shack book are very dated; however, for someone new to programming, those ideas are better than none at all.

Originally, the flowchart doctrine relaxation took the form that, well, you can begin to program without a flowchart, but its construction is required at some phase of the program development cycle. Eventually, however, some heretics began to claim that flowcharts have no place in the program development cycle and flowcharts are to programming as woodchips are to toilet tissue.

In time, flowcharting fell from grace and flowchart templates were thrown in the useless-stuff drawers along with slide rules and typewriter ribbons. Oh, some programmers continue to flit through a small flowchart now and then during algorithm development, but gone are the monstrosities which plagued us during those early years.

An Idea Whose Time Has Come?

Why am I bringing up this subject now? Has Bob gone bonkers? Am I writing this just to throw Dave Small into fits of laughter? Not really, and, in fact, Dave has presented a very pragmatic view of programming in two very recent issues of Current Notes; so well written that I shan't even touch upon those aspects presented by that master programmer. (That's all of the sucking up I do in one article, Dave.)

I do want to make at least this much of a case for flowcharts: it is not the concept that was/is flawed; it was/is the notion that the tool should or could control the thought process of the craftsman. The entire concept of what programming is was skewed when the flowchart concept was first introduced.

An accurate viewpoint of inaccurate dogma is expressed by the following two sentences extracted from the Radio Shack chapter on programming:

"This first step in program development can often trip up a programmer. If you jump into design without understanding the problem that your program is to solve, then your program is doomed from the beginning."

If the above were true, very few programs would ever be completed. And it was the dogmatic insistence by those who were selling the idea flowcharts be completed before programming begin which, more than anything else, caused programmers to reject flowcharts as a programming tool.

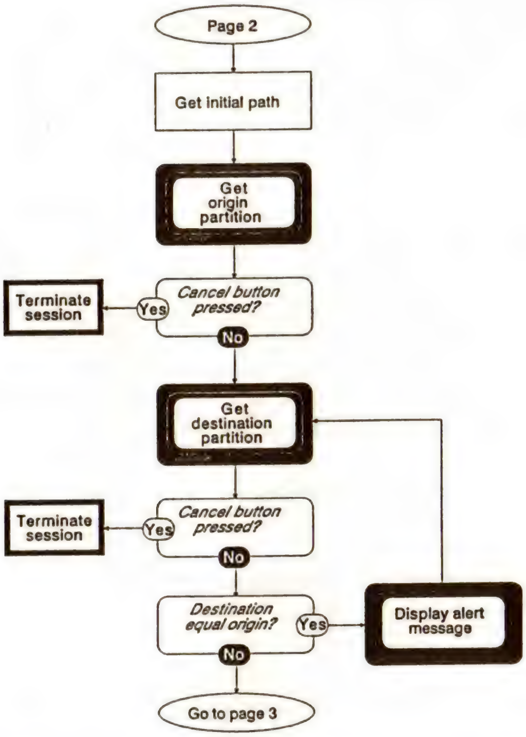
The truth is the programming process is more than just defining the problem; furthermore, you can indeed begin to write a program while having only a very hazy concept of the problem. Hell, you can begin while having only a very hazy concept of programming.

Using Flowcharts to Clarify Ideas

The Radio Shack chapter does point out the utility of flowcharts as design aids. A quick simple flowchart sketch can often solidify hazy ideas into a draft algorithm; the draft can be used to jam lines of code into the editor—that's what it's about, after all. But to extrapolate the flowchart's significance as a design aid to significance as a requisite documentation device, as the chapter does, is nonsensical.

Flowcharts as Supplements to Documentation

As a supplement to natural language documentation for any process, be it automotive repair, semiconductor testing or even cooking, flowcharts can enhance a presentation, but it hardly functions as definitive documentation.



That's one of the reasons why documenting with flowcharts could not live up to expectations; programming managers wanted the flowchart to be the documentation.

Another reason is that flowcharting was very time consuming; another is that the design of a flowchart was never fixed. And alterations to existing flowcharts took more time than did the original work. Finally, I'd like to stress another reason that flowcharts have not been as useful as they can be. The standard flowchart symbols just don't have enough graphic impact to make them worth the bother.

A Debugging Tool

Recently, I had reason to "rediscover" flowchart utility. After completing the draft design of a complicated algorithm (I *am* a developer, albeit a slow one), I found debugging to be rather confusing because I was having an extraordinarily difficult time keeping track of my location within the algorithm. I had found a critical error in logic, and I knew precisely what needed fixing, but the precise location within the algorithm where the correction should reside remained elusive.

Enter Draft Plus, Stage Left

Finally, I decided I couldn't perform the correction without a flowchart to serve as a map of the algorithm. I started looking for my old green templates, but they were scarfed up by gremlins long ago, so I resigned myself to free-hand work. Suddenly, I was inspired! Why not use the ST to draw the flowchart? After all, I had purchased (but never used) GFA Draft Plus at the San Jose show.

The more I contemplated the idea, the better I liked it. I could remove the symbolic restrictions imposed by the United States of America Institute and design my own symbols; symbols that would provide a greater impact graphically. I began to study GFA Draft Plus enthusiastically.

Exit Draft Plus—To The Garbage

I didn't work with Draft Plus very long before I realized it was not even worth the $9 I spent for it. This package has no drafting features whatsoever. No rulers, no grid and some poor excuse for a cursor that places objects on the screen with absolutely no regard for where I want them.

I find it to be less of a drafting program than Degas Elite. I had previously done a lot of drawing using Degas with the assistance of a 6-inch ruler and a compass held up to the video screen; a tedious process at best. I safely conclude that the ruler/compass method forced by Degas's lack of features is infinitely more pleasurable than using Draft Plus.

Sifting through Rubbish

After deciding to give up, and while relating the incident to a sympathetic friend, some enthusiasm returned when he informed me that he had on his ST most of the drafting and desktop publishing software available. He walked me through the programs one by one until I finally found a suitable package.

I've seen all of the advertisements; I've read all of the hyperbole; and now I've tried most of the programs. I conclude there are a lot of drafting and publishing programs sold in the ST market that should not even be given away, unless to your worst enemy. But I have found one pearl among the rubble.

Enter Easy Draw, Stage Right

As for drafting programs, Easy Draw is the exception. Easy Draw is good. Perhaps Easy Draw is the best. I had to invest some valuable time learning to manipulate the program's most applicable features; and there was GDOS, fonts and the ASSIGN.SYS file; but the results justify the effort. I've begun to develop a flowcharting repertoire which just might lead me to expend more effort towards the refinement of this tool.

What It Be Like

I am including two Easy Draw *.GEM files, each of which contains one page of the first two pages of a flowchart I am designing for my own use. I know the editors of AIM do not squander magazine space, but perhaps they will be inclined to print one or two.

I think the flowchart icons I developed within Easy Draw will graphically speak for themselves; else I've failed to design better icons than those standard icons which I have condemned. However, it is not my intent to provide universally definitive flowchart icons; I require them to be only personally definitive. I encourage you to develop your own, and, if you are so inclined, to share yours via AIM.

CODEHEAD SOFTWARE
The finest in productivity and utility software for the Atari ST

Announcing:
CODEKEYS
The latest addition to CodeHead's streamlined fleet of luxury vehicles!
The Macro Tool!
Automate any task on your Atari computer with CodeKeys! CodeKeys records all key and button presses and plays them back with precise timing, or as fast as possible! Use CodeKeys to assign keyboard equivalents to drop-down menus, to create a "timed save" function for any program, or to click on icons, buttons or windows! Fine-tune your macros with a flexible GEM-based editor - macros can be nested, looped, repeated, or delayed!

CodeHead products are available at your local ST dealer or call us directly for more info.

Developing More Icons

The images I supply are only two of those I require for my complete flowchart; therefore, I will develop many more icons along the way to completion. In case it is not obvious, perhaps because of my lack of drawing expertise, the icons which look like a video screen do represent same.

I direct your attention to the video screen icon containing the text "Display alert message." As soon as I connected this icon to the "Get destination partition" icon, I realized I had introduced an undesirable algorithm lock. The lock is this: if the user is alerted to the fact that identical origin and destination partitions have been selected, and if it is the origin partition entry which must be corrected, the user must exit the program to do so.

See, the flowchart began to assist me right off the bat.

FEEL THE SPEED!!
Quick ST II
FREE DEMO AVAILABLE!!
Software Screen Accelerator version 2.21

- speeds up your ST's screen graphics
- faster than hardware accelerators
- speeds up all fonts, including GDOS fonts
- requires less than 28K of memory
- supports all screen resolutions
- supports custom desktop backgrounds

The magazine reviews said of Quick ST II:
"*amazingly FAST*" - Nick Berry, PSAN (4/90)
"*I highly recommend this package*" - Ron Schaefer, ST Informer (6/90)
"*Buy it*" - A. J. Wrotniak, Current Notes (6/90)

See for yourself why over 5,000 fellow Atari ST users swore by Quick ST II in 1990. Buy Quick ST II for only $19.95 (or less) and enjoy a faster ST or STE computer!

ATTENTION ALL ST USERS!
Have you received your copy of the Branch Always Newsletter yet?
We have just released our year end newsletter packed with complete product information about our **Quick ST II** and **Quick Tools** packages, update info, dealer lists, hints and tips about using our products, questions and answers from our users, user group discount info, and valuable discount coupons for our new products for 1991. The newsletter was sent free to all registered users of our products and to all user groups in Canada and the United States. **To receive a FREE newsletter, send us your name and address and a copy of this ad.**

16Bit Computer Faire in London

Michael Shütz

[with additions by Pattie Rayl]

I just returned from London yesterday, so here is my (German) 10 cents worth about the London show.

There were over a 120 vendors at the show showing off software and hardware for the ST and Amiga. Typical for the English ST market, the whole show was dominated by game software. Where, for example, the Atari fair in Düsseldorf, Germany, is probably 80 percent dedicated to application products and maybe less than 20 percent to game software, at the 16Bit Computer Faire in London it was just the other way around.

US Vendors

Naturally, there was other stuff to see and buy besides games. Double Click Software was showing off their own DC Desktop and DC Utilities as well as Computer Safari's font packages and Branch Always' Quick ST II. Strangely enough, Mike and Jim of Double Click got more questions on whether they were going to sell their Stacy than their software.

Atari Interface introduced their Atari magazine, complete with public domain disk of the month and Clear Thinking's EdHak editor to the English crowd.

Talon Technology was showing off PC emulators and their new line of designer mice available in a plethora of colors.

Best Electronics shared the display with Talon Technologies. Brad didn't seem to be completely happy with how the show went for him.

Soft-Logik's Stephanie Manning traveled from St. Louis to demonstrate both the Amiga and ST versions of Pagestream. PageStream was "wowing" the show-goers, who were mostly Calamus or Fleet Street owners, which is natural considering where these programs originally came from.

European Products

Retouche Professional was shown by the English distributor. HiSoft was there with their full range of programming languages, and even some German companies like the modem supplier CSR and the hard drive manufacturers LACOM and PROTAR came to London to show off their products.

Quality games like Captive, Powermonger, Speedball II and Populous could be purchased for 17 pounds (approximately $30).

Even with over 120 vendors, not many were developers. A very high percentage was made up of large dealers and vendors selling public domain software or commercial software and/or hardware. User groups had booths set up and there were several UK magazines, such as Let's Compute and ST Format, present.

The show was held on two floors at the Novotel in Hammersmith and was very well accepted by the English public. There were many times during the three days where rows between the booths were blocked simply because of the large number of visitors.

A very high percentage of the visitors were kids and students, naturally attracted by the games. Unfortunately for the US vendors, these types of show-goers didn't seem to have much spare money to spend on new (to them) US products. The attendance for this 16Bit Computer Faire was projected at around 20,000 Amiga and ST owners.

The Show's Over

All in all there was nothing new to see for the ST, but the show was a success for both the organizer, Westminster Exhibitions, and most of the exhibitors.

For the US vendors, it seemed their hopes of a market that was at least similar to North America's weren't fullfilled.

Several vendors had to send product home, and those fortunate enough not to, had to scramble to find a UK distributor to purchase leftover products.

It would seem the grass in the UK is just as green as it is here in the US.

SLICCWARE™ ships FREE product updates !

By Randy Foster
President of **SLICCWARE™**

With the beginning of the new year, SLICCWARE™ released version 1.02 of SLICCTOP™, which adds new software specially designed to monitor and maintain operating system integrity.

In keeping with company policy, updates were shipped, free of charge, to all registered owners.

With SLICCTOP™ . . .

The user need not abandon the desktop to enter an application. Support is provided for special desktop applications to run concurrently on the desktop with full data sharing. In addition, the user may toggle back and forth between the desktop and any program which uses a standard menu bar -- while applications on the desktop continue their processing uninterupted.

No longer need a user wait while long transfers or printouts are taking place. Processes such as copying, moving, deleting, or printing files, are placed in a queue at the time they are initiated. And because the system is multitasking, the user is immediately free to initiate another process or continue working with his favorite software.

No longer need a user watch helplessly while a process, initiated unintentionally, is carried out to completion. Select CANCEL from the watch box provided, and the process is terminated immediately!

Like organization? SLICCTOP™ allows the user to organize his working environment by installing up to 144 applications, data files and windows for quick access from the desktop menu bar or keyboard equivalents!

Short on memory? SLICCTOP™ uses high speed code swapping to minimize memory requirements; and, if the user desires, may be swapped out almost entirely while executing a program. That is why SLICCTOP™ requires a hard drive.

Purchase price . . . **only $49.95 !!**

For more information, call: **(206) 867 - 1786.**

Or to order directly, send $49.95 (check or money order payable to SLICCWARE) to:

SLICCTOP, P.O. Box 2609, Kirkland, WA 98083

STash v. 1.4

High Speed Hard Drive Back-up Program

R. Larsen & J. Hepworth (STUN)

Data On Drive C: May Be Damaged or some other computer profanity jumps to the screen.

Yes, it's true, sports fans. Even the most expensive hard drive can suffer from sudden amnesia for many reasons. Maybe you just dragged the wrong files to the trash icon. Maybe the whole drive quits working. Either way you now have a serious problem.

An Ounce of Prevention

The main thing to remember before anything happens to the files you have stored on a hard disk is *back-up your data!* A lot of hard work could be saved by making a copy of the information onto a set of diskettes. It's painless, and you can rest at night knowing you won't lose your files once you have them stored.

STash from Silicon Mountain Systems can provide you with a reliable disk back-up of those precious files on your hard drive in a hurry and with a lot of optional choices. Sometimes you back-up the whole drive; other times you back-up just the files that are new or changed since the last time you did a back-up (incremental).

Do you have files on your hard drive larger than can normally be stored on one disk? That's no problem with STash.

The program comes on a single disk, and several helpful utilities are also included. The manual is brief, but covers all the features. A discussion of the differing theories behind back-up methods leads off the documentation.

How STash works

STash is unique in its approach to data back-up. Rather than the two main methods used by other back-up software, STash makes use of both at the same time. Some programs just copy files from the hard drive to disk as files, while others make a "bit image" copy of every sector of a hard drive.

Both ways have drawbacks. File copiers can't handle a file that is too long for a floppy disk and are generally slower and use up more disks. Image type copiers seem fast and complete, but the back-up can't be restored to a drive if you change the size or the total number of the partitions.

STash copies files from your hard drive and writes them as an image on specially formatted disks, putting the most data on the fewest number of disks. Any file that is larger than normally fits on a disk just smoothly spreads to the next disk.

The beauty of using STash is that it runs in all three resolutions and even with limited memory and accessories or auto programs loaded you won't notice any drop in the performance of the back-up. Often, back-up software requires that nothing reside in memory besides itself.

You have the option of using either a single- or double-sided disk drive. You can back-up a whole partition or just one folder and everything in it. You can turn disk verify on or off. Probably the nicest feature is that STash reports the total number of disks it will need before it begins to write to any of them!

STash won't let you use the wrong disk, either. If you accidentally put a disk in the drive that already has part of the current back-up stored on it, you are prevented from overwriting the data already on the disk.

A small configuration file stores the information you supply about your disk size (single- or double-sided), which type of back-up you wish (full or incremental and recursive or non-recursive), your write verify choice and the selected path.

Since you may need to make more frequent back-ups of certain parts of your drive than others because of the replacement value of the files or the constant change of the data, you can save several different configuration files and load them to instantly set up for each particular back-up.

Using STash

STash intelligently handles a bug in Atari's TOS 1.0 and 1.2 that set the archive bit in the directory for each file, giving back-up software the wrong information for incremental back-ups. Whatever version of TOS you are using, STash works right.

Some Drawbacks

There are some possible drawbacks to using STash as your hard drive back-up program. You are allowed to use only one floppy drive for the back-up even if you have two. The disks are given a special format over which you have no control. The format is 80 tracks with 10 sectors per track. You may have drives that will write to more than 80 tracks, but you can't do it.

The format is not a TOS file format, so you can't go in and select a few of the files and restore them. In fact, if you attempt to look at the directory of these disks, you get garbage like something is wrong with your computer. This requires you to install the complete back-up (however, remember that you can do partial back-ups and the back-up may be small enough so this is no bother).

STash apparently has no way to restore a back-up to the hard drive if one of the disks in the back-up is unreadable. The files will be safely restored up to the point where the disk error occurs, but no other disks of that set can be restored.

Missing from STash is a permanent logging procedure. Files are listed to the screen during the back-up, but there is no way to scroll back through the list or print it or store it to disk with the back-up. When the back-up disks are complete, there is no way to know what files are on them.

Testing STash

When STash was tested on a Mega 2 with TOS 1.4 to make a back-up of a 5 megabyte partition with 4.9 megs full, these were the elapsed times:

1st Back-up verify on: 22 min. 58 sec
(disks need formatting) .
2nd Back-up verify on: 12 min. 28 sec.
(disks already formatted)
3rd Back-up verify off: 6 min. 00 sec
(disks already formatted) .

You can see that if you feel secure doing the back-up with write verify off on disks that already have the special STash format, you can produce a rapid complete back-up of your hard drive—nearly a megabyte per minute. Of course, incremental back-ups will go even faster.

Making your data safe from "hard drive amnesia" is fast with STash and restoring the STashed away data is easy, too.

GramSlam

from Phil Comeau Software

Bill Pike (PAC)

Write it Right, Right? Right!

When I began writing reviews, I was just having fun passing on what I learned—both the good and bad points of programs and systems. I consistently used a spelling checker and I thought if the spelling was correct I couldn't be far wrong.

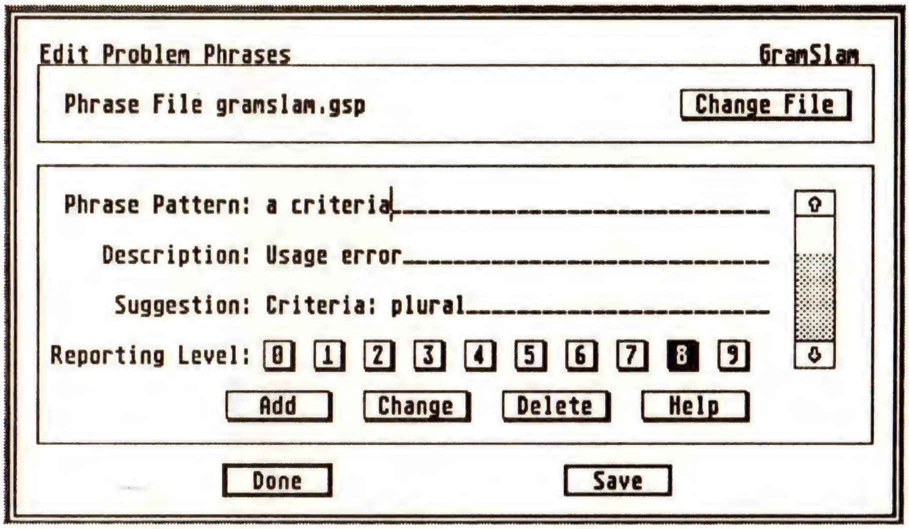
As I continued, I had more than a few critical comments about my murdering of the "King's English" (sometimes by slow torture) from friends and others. I found the need, read that necessity, to improve my grammar.

If I was using an Itty Bitty Machine (IBM for the uninitiated), several programs would be available to check grammar, at a cost of from $75 to $250. However, not using an IBM emulator, that option was not open to me.

To make a long story shorter, about a year-and-a-half ago I found a demo of a program called GramSlam. I tried the program and it was just what I needed. And, the price was right. Needless to say I ordered the full working version within a few days.

Version 1.0 was awkward to work with, but it did the job. The program is now at version 3.0 and works very well indeed. GramSlam checks for 1,200 abuses of the English language. I am now using it consistently for all my writing.

There is a demo version of GramSlam version 3.0 on CompuServe for those who wish to look before buying. I have nothing but praise for the companies providing this option of "try before you buy" instead of sticking you with a program which doesn't do what you wanted.



Edit Problem Phrases

GramSlam

Phrase File gramslam.gsp

Phrase Pattern: a criteria

Description: Usage error

Suggestion: Criteria: plural

Reporting Level: 8

Let's Get To It

Enough of the background! GramSlam is a Grammar and Style Checker. It compares words and phrases in a document with a listing of possible errors. The listing has been compiled by Phil Comeau from nine college level and beyond books of grammar and style.

The program can also check for variations between American and English language spellings. Yes, you can add your own pet phrases to the program if you wish.

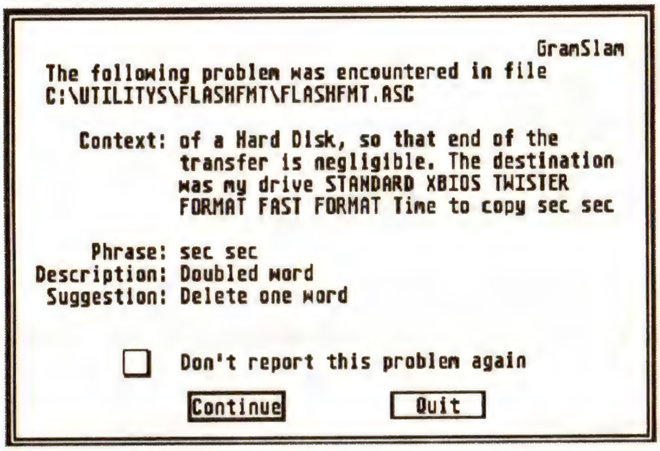
Some of the features are: It works on any Atari 16-bit computer in medium or high resolution. GramSlam runs as an accessory or from the desktop. Multiple levels of checking—from Brooklyn to formal London—are supported.

The program works with any text editor/word processor that can output an ASCII file. A readability index (FOG index, years of schooling needed to understand the document) is shown after the check is complete, along with statistics about the document. It even checks for double words.

GramSlam can output to the screen, a printer and/or a disk file—all at the same time. You are shown the problem it has found, the context surrounding the problem and a suggested correction.

The program is a bit dumb—it just looks for words and phrases, so some suggestions should be taken with a grain of salt. I suggest saving the file to disk along with the screen display. This allows you to open a second window in your word processor/text editor containing the "problem" file next to the original document.

The manual for the program is well written, and covers just about everything you could wish. However, it doesn't cover how to install the program on a hard disk. Oh well, we can't be perfect. Just copy all the files to a folder anywhere on your hard drive (how about your word processor folder?)



```
                                                    GramSlam
  The following problem was encountered in file
  C:\UTILITYS\FLASHFMT\FLASHFMT.ASC

       Context: of a Hard Disk, so that end of the
                transfer is negligible. The destination
                was my drive STANDARD XBIOS TWISTER
                FORMAT FAST FORMAT Time to copy sec sec

        Phrase: sec sec
   Description: Doubled word
    Suggestion: Delete one word

           ☐   Don't report this problem again
```

The manual has a discussion of how GramSlam works and its limitations. Another section shows examples of errors along with the level assigned to each type of error, to give you an idea of just what the program is reporting. The reporting environment is discussed and examples are given. You are shown how to edit (add) your own pet errors for the program to find. There is also a discussion of how to interpret the information in the Document Statistics shown at the completion of a check.

There is only bad point I can find with the program—it only works well with ASCII files. Non-ASCII files can be checked, but the program does get confused.

Why it is suggested to install the program as an accessory, I don't know. It is also suggested that you install GramSlam as an application (do you wish to check every file with a particular extension?). I just run GramSlam as a program. I suggest saving your document in your word processor format first, then saving the ASCII file for checking by GramSlam. That way, you can load your file back into your word processor and easily make changes later.

GramSlam 3.0

How's Your Memory?

A Guide to Upgrading the Memory in Your STe

Eric Schofield (RACE)

According to the survey that STart magazine conducted of its readers last year, approximately 25 percent of Atari ST users plan on upgrading the memory in their computers. At one time, increasing the RAM in your ST was a complicated procedure. There are numerous upgrade boards available and who knows which ones are easier to install or are compatible with your machine?

Atari's introduction of the 1040 STe on US shores has simplified the matter greatly. One no longer needs to purchase upgrade boards or dynamic RAM chips. Improving one's memory is as simple as adding more memory modules directly into the computer.

The concept is sheer simplicity, but that's where the simplicity ends. Once you get your memory modules, the question arises as to which bank do you insert your new modules into? Do they have to be inserted in any special order?

What is a SIMM?

Before I get too involved in the actual process of upgrading the memory in your STe, let me explain what these memory modules are. The memory modules used in the STe are referred to as SIMM units. SIMM stands for Single Inline Memory Module.

A SIMM unit consists of a small circuit board which measures about 1 inch wide by 3-1/2 inches long and houses eight memory chips on the surface of the board. These SIMM units plug right into the STe's motherboard thus requiring no memory upgrade board. A 1 megabyte SIMM unit can be obtained through mail order for less than $60 and they should be purchased in pairs.

The 1040STe comes with four 256K SIMMs which equals 1 megabyte of RAM. In order to upgrade your memory, you would have to purchase either two 1 meg SIMMs to upgrade to 2 megs of RAM or you would have to purchase four 1 meg SIMMs to upgrade to 4 megs of RAM.

Installing SIMM Units

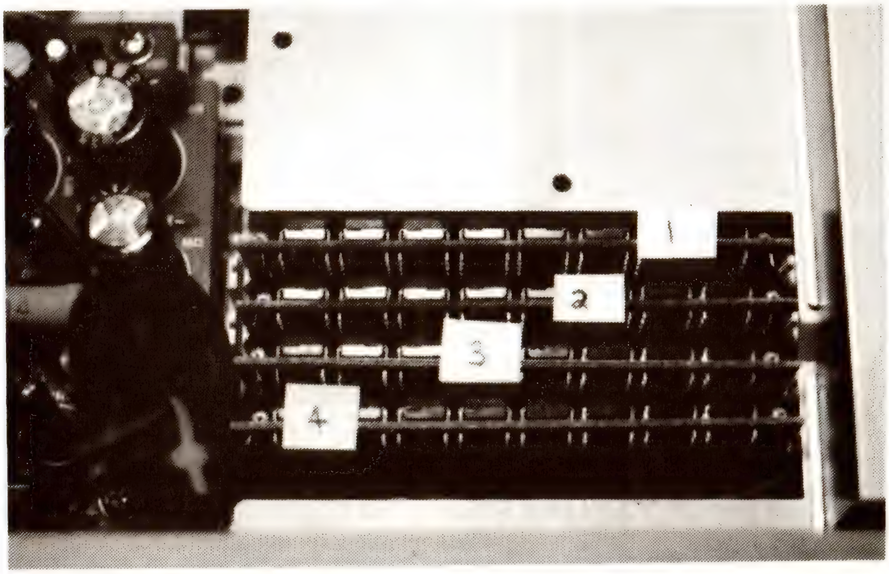
Installing your SIMM units is a fairly simple task. You will need a Phillips screwdriver and flathead pliers. You must first remove the cover of your STe (Note: this procedure voids your warranty. You should contact your dealer and inform him of your intentions).

Once this has been done, you must remove the shielding which covers the left side of the computer's power supply. This shielding consists of six screws across the top and three screws on the rear. There are also two metal tabs which should be bent straight with the flathead pliers so that you can remove the shielding from the case.

Once the shielding has been removed, the SIMM unit housing will be revealed to the right of the power supply. There will be four rows of SIMMs. With the keyboard facing you, the SIMMS are numbered in reverse order (i.e., SIMMs are numbered 4, 3, 2 and 1 starting with the row closest to you).

You must first remove the four SIMM units that are occupying the housing. This is a simple procedure. On the left and right side of each SIMM, there are tabs that must be pushed to the side. Then, pull the top of the SIMM unit towards you.

The final step requires you simply to pull the SIMM unit out of the housing. Repeat this procedure for all four units.



Variations

If you are expanding your memory to 2 megabytes of RAM, you should place your 1 megabyte SIMM units into slots 3 and 1 of the housing. This procedure is quite simple as well. Insert the first SIMM unit into slot 1 at a 45 degree angle. Be sure the SIMM unit is sitting squarely in the slot.

All you have to do now is push the top of the SIMM unit up so it sits perpendicular to the motherboard. Be sure the tabs of the SIMM housing snap securely around the SIMM unit. Repeat this procedure for all of the SIMM units you install. If upgrading your RAM to 4 megabytes, simply install all four 1 meg SIMM units into the four existing slots.

Before closing up your computer shielding and casing, you should boot your computer to make sure everything is installed properly and the contacts are making good connections. Be sure not to touch the power supply while testing the SIMMs. You could receive a *nasty* shock! If you have problems booting your computer:

1. Make sure your SIMM units are placed in the proper slots if you are upgrading to 2 megabytes (slots 3 and 1).
2. Make sure your SIMM units are seated securely into the SIMM housing.
3. Have your dealer check your SIMM units to find if they are working properly.

Can I Have 2.5 Megs of RAM?

Many of you may be wondering if it is possible to obtain 2.5 megabytes of RAM. The answer to this question is yes. All you need to do is place your 1 meg SIMM units into slots 3 and 1 and place your 256K SIMM units into slots 4 and 2. This should give you 2.5 megs of RAM.

If you find that this procedure gives you 4 megabytes of RAM when you do a memory test, the problem is with your MMU (memory management unit) chip. Some of the MMU chips that came with the 1040 STe's do not check to see what type of SIMMs are in the slots. It detects that there is a 1 megabyte SIMM in slot 1 and since all four slots are occupied, it presumes there are four 1 megabyte SIMMS installed. This will cause your computer to crash if you run a program that tries to address the additional memory that isn't there.

If your computer does not recognize 2.5 megabytes of RAM, all is not lost. There is a patch program available on the major online networks that, when put into the AUTO folder of your boot drive, will reprogram the MMU to recognize the proper amount of RAM. The name of this program is SIMMFIX.ARC. Good luck to all of you and if you have any problems, just give your dealer a call!

Drakkhen

Scott Sorg

Drakkhen is a fantasy role playing game by Infogames. The genre has seen some excellent games (Dungeon Master, Phantasie, Bloodwych), and here's another game destined for greatness.

The graphics are slick and fairly smooth. The sun travels across the sky every day, and the sky changes colors from the oranges of sunrise and sunset to the purples of night. The scenario is original and very good, and the interface is easy to work with.

Background

The scenario of the game is that the father, who created all, created the drakkhen in his own image. He also created the great dragons to rule over the drakkhen. It was the great dragons, who in their desire to create, brought forth man upon the earth. Many millennium later, the last great dragon on earth has been killed by a misguided Paladin. This act fulfills a prophecy that signals the end of mankind and the re-emergence of the drakkhen. The death of the great dragon brings the end to magic in the world.

All the Kings of the world gather to discuss the ramifications of a world without magic. They discovered, from the crew of a royal flagship, that an island had come into being; home of the drakkhen.

The island would soon grow to encompass the entire world. They also learned of the Ninth Tear, a faction of the drakkhen sympathetic to humans. A human priest had stayed behind on the island with members of the Ninth Tear faction.

Your King has chosen you and three companions to go the island of the drakkhen. You must find the priest and solve the mystery of the Ninth Tear. Do this and the world will be saved, fail and die with the knowledge you have allowed the destruction of mankind.

Instruction Manual

The instruction manual is not the worst one I've seen, but it's definitely not the best. The characteristics (str, dex, etc) most important for a particular class aren't well defined and the special abilities of each class (fighter, scout, priest, magician) aren't even mentioned.

One very important thing was also left out of the manual. The manual doesn't tell you how to cast spells outside of a combat situation. The manual gives you enough information to get started in the game but that's about it. It doesn't include any (none, zip, nada) hints in terms of strategy. The manual doesn't even tell you really where to start.

Game Play

You can play with preselected characters, you can't save the game this way, but you can get the feel of the controls and wander around a bit to see what's what. You start the game without your armor and weapons.

During the game there are basically two modes of operation, group mode and character mode. Group mode shows first person view (like Dungeon Master). This mode cannot be used indoors. Character mode is a third person view, where you can see all of your characters and command them individually. Outdoors you can toggle between group and character modes by hitting return. Encountering a creature will also automatically take you from group to character mode.

One of the interesting features of the game is that the movement is not the standard front, back, turn left and turn right. The movement is more like that in a flight simulator. You can rotate left or right 360 degrees, so you can lose your sense of direction easily. You can, however, regain your sense of direction by waiting until sunrise to find East. Around most castles and buildings there are directional arrows pointing each compass direction. Also at each crossroad there is an arrow indicating North.

There are also roads from place to place which (if mapped) allow you to consistently find a particular place (castle, temple, weaponsmith). But woe to you who wander off the road with out having mapped the roads in the general area.

Getting to the temple to be healed is something you'll need to be able to do consistently. After some mapping has been done, you can cut across country fairly easily to shorten your travel time (lots of *big* creepy crawlies at night) which has advantages. Bottom line: if you are going into a new area, map it before you go wandering off into the wilderness 'cause it's a big island, and it doesn't pay not to know what road you've just come across.

As you are traveling along in group mode, you may find yourself suddenly changing to charac ter mode. This means that a monster is on its way. If your combat icon is on, your characters will automatically attack. Not all monsters encountered outside are aggressive, there's an old man who appears in various locations to give you directions to a nearby tavern, temple or weaponsmith.

Character mode is used in all combat situations and inside castles and dungeons. The character mode is very similar to graphic adventure games like King's Quest series but the graphics themselves are much better. There are no real mazes, just directly connected rooms. Mapping is still useful but not as mandatory as outside.

Each castle is inhabited by one of the eight drakkhen princes, and each castle has a mystery to be solved. The castle in sight when the game starts is the castle to start with. If you play it right you will receive clues on where to visit next. One last note—don't be too kill happy. You may lose some information. On the other hand, don't be unprepared for trouble or you'll be toast.

Bottom Line

Except for the oversights in the manual, this an excellent role playing game. The puzzles so far have been challenging but not quite impossible. Clues tend to be easy to find but hard to decipher. At first it's hard to keep your characters alive, but better weapons and armor are easily found.

Mega Click™

For the Atari Mega 2 and Mega 4* Computers

BEST ELECTRONICS

New Product Announcement

Have you ever felt that something is missing from your Mega* computer? Those who have used other brand computers for work or school agree something is missing! When asked, any touch typist who owns a Mega computer will tell you right away! It's the Click in the keyboard key they miss!

Best Electronics is happy to announce their new product for the Mega 2 and Mega 4 keyboards called "Mega Click." By the name you can tell what this product does. After searching the world for half a year, we've found a replacement keyboard switch that gives the Mega owner that positive tactile "click" response like most real-world keyboards!

Our test sampling of Mega owners, who have tried our test Mega keyboards with Mega Click installed, all say the same thing, "I want the product now!"

The installation of Mega Click keyboard switches requires the ability to unsolder and solder-in components in your Mega keyboard. We strongly recommend that installation be done by an Atari computer service center!

Mega Click keyboard switches are packaged in a **30 Switch Starter Kit** and a **10 Switch Add-on Kit**. Suggested retail for the 30 Kit is **$64.95**, and for the 10 Kit is **$21.95**.

Mega Click Products became available December 26th. Place your order now!

Epson Action Printer
ELP 6000

Gary Lentz (SWAG)

I was the guy who was perfectly happy with my NEC CP6 24-pin color printer. After all, it does do graphics in 360x360 mode. And what did I need with a laser printer that would output 300x300 max?

I knew one thing for sure, if I ever got a laser printer, it would not be an Atari SLM. Why? Because if, after buying a laser printer, I found out that it was not the answer and I wanted to sell it, I didn't want to limit the resale market to Atari owners.

So one day this last fall, I received a 10 percent discount certificate from Wards and with my plastic money and wife in tow, I dropped in on my favorite Wards store. Just to browse, if you know what I mean. And there for all to see in the computer department was an Epson Action printer (ELP 6000). It was on sale for $949, marked down from $1049.

And there I was, armed with my 10 percent discount certificate and a rather large credit line on the Wards card. An understanding and permissive wife helped too. So I bought one and took it home.

Set-up was rather uncomplicated. Pull it out of the box, remove the shipping protection, drop in the drum and toner cartridge, plug it in and hook it up to the parallel printer port on the ST. The Epson will handle either parallel, RS-232C or RS-422A serial input.

In a matter of moments my favorite word processor was booted up, and I was checking the six resident fonts. Then I moved onto graphics and DTP.

Oops, More Memory!

Right away, I found out 512K didn't quite cut it. OK. A phone call to Epson about a 2 Meg upgrade ($800 from them) where I was advised to try a local dealer to save money and was provided with the names of three dealers in the Portland, Oregon area.

A call to ComputerLand, a 10 day wait, $312;I've got 2.5 Meg onboard in the printer; fired up PageStream, used the HP Laser driver in PageStream and in moments I was printing full page graphics.

The RAM upgrade board...I almost forgot! Installation was a snap and the board has empty sockets for another 2 Meg if I want to expand. All I will need to do is buy the chips and plug them in.

Just in case I have problems using the laser printer in the HP mode with my other programs, I ordered from another local store the Epson FX emulator cartridge. Five days and $129 and the emulator has arrived and is installed. Now I wonder why I took so long to decide to buy a laser printer. Haven't tossed out the trusty NEC CP6 though—still need it to do mailing labels.

It takes about 12 minutes in HP mode to pump out the first page and then copies follow at the rate of one every 10 seconds after that. In Epson FX mode printing text, it takes about 10 seconds to print the first page of text, whether or not there is one word on the page or the page is full of text. One of these days I'll figure out how many CPS that is.

One of the most rewarding things I've done since acquiring the laser printer was booting up Image Cat and printing out all my clip art. Now I don't have to guess what the picture is before I load it. All I need to do is take a look at the very nice printed pages of clip art to find what I want to use.

If you've been thinking about a laser printer, take a look at this one. Wards is still selling them and I have seen them advertized in Computer Shopper for as low as $798. The printer comes with a full year warranty on parts and labor and for the first six months, if you have a problem or it breaks down, a repair person will come to your location to do the repairs.

Toner cartridges are good for 1500 copies and cost $19.95 from your local ComputerLand Store (a lot less than suggested retail). The drum is good for 10,000 pages and replacement drums are also available at ComputerLand for around 50 percent off suggested retail.

I have been using laser printer type paper, but have found that it works just as well with copier paper, 25 percent cotton bound and several types of heavier weight paper. It will handle standard letter and legal size through the paper tray. It also handles standard and legal size envelopes by manual feeding. You can manually feed paper ranging in size from 3.2 x 5 to 8.5 x 14 inches. The printer will also handle transparencies.

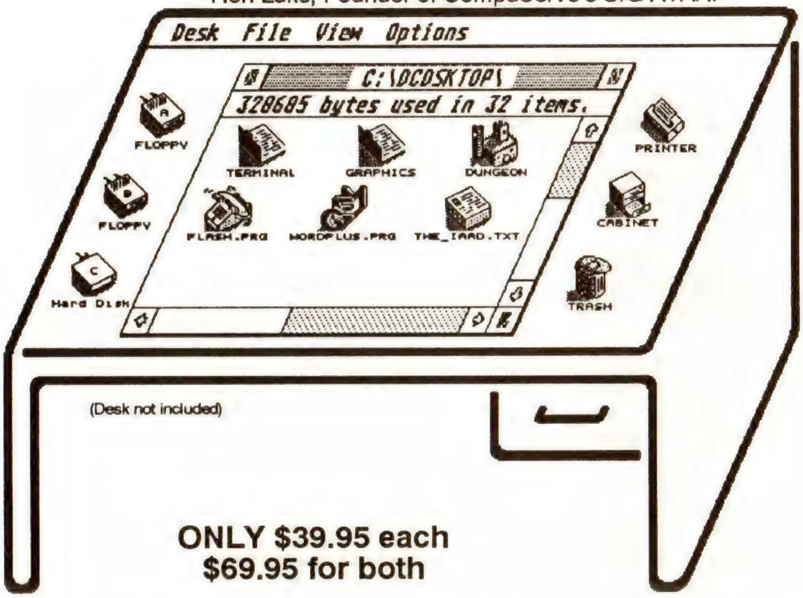
I understand this is the same laser printer engine Atari is using for their new model laser printer (SLM 604). For slightly less than the retail price of Atari's new model, you can purchase the Epson Action Laser (ELP 6000) and have 2.5 Meg onboard, the FX emulator and have a laser printer that is not limited for use with only the Atari ST/Mega.

DC DESKTOP

New Programs and Features
ONE LOW PRICE!

"The GEM Desktop just got better"

"DC Desktop is a permanent part of my system."
–Ron Luks, Founder of CompuServe's SIG ATARI



328685 bytes used in 32 items.

(Desk not included)

ONLY $39.95 each
$69.95 for both

Enhance, don't replace!

- Place programs & **folders** right on the desktop
- Display unique file, folder and drive icons
- Color icons
- Store frequently used files and programs in our exclusive CABINET virtual disk drive
- Display NEOchrome, Degas, TINY,Spectrum, ART director and Mac pictures from SHOW
- View files at the desktop with an enhanced SHOW routine (with mouse control!)
- Replace the desktop with a pattern or picture
- Recover files from the trash
- Spool/queue printing from desktop or program
- Works in all resolutions, STE and TT too!
- Drop down menu commands via keystrokes
- Load different desktops with a keystroke
- Comes with a command line interface, bootup selector, terminal, icon editor, more
- Special hooks let RAM resident programs be called with one key from DC Desktop
- Completely modular and memory resident – only use what you want!

DC Xtract 2.0 shown. *Throw away your ARC shell!*

"These programs are fabulous!"
–David Plotkin, STart Contributing Editor

- **DC XTRACT 2.0** has it all! **ADD** or **EXTRACT** ARC, LZH, ZIP or ZOO archives! Super-fast 100% assembly! Now everything in one place!
- **DC SQUISH 1.4** now compresses better than ARC and still reduces load time! *Absolutely* 100% compatible with everything!
- **DC SEA 2.0** now creates self-extracting ARC, LZH, ZIP or ZOO files. Also restore the files from the program.
- New programs added.
- **ALL existing programs have been upgraded!**

ARC licensed under agreement from SEA Corp.

AIM Disk of the Month March, 1991

All files on this disk are self-extracting LZH archives created with Double Click's Self-Extracting ARC program DC SEA! To use these programs, simply double click the files. Then, click on Extract and select the drive/folder to which you want the extracted files saved. Click on Verbose to get a list of the files in each archive or Exit to abort.

Here's a short description of the files on the March, 1991 disk. For more complete docs, see the text files contained in most of these archives.

ASTROCAL.APP—Generates a calendar of astronomical info and info on events such as eclipses and dates of Easter.

CHIPS.APP—US Gold demo of Chip's Challenge, the hit arcade game on the Atari Lynx. This demo lets you play Level 9, no sound. Color ONLY.

CROSSWRD.APP—Chuck's Crossword Puzzle Program, from Chuck Cartia of the Westmoreland Atari Computer Enthusiasts. Allows you to easily duplicate puzzle grids from you newspape, then work the puzzle on the screen rather than on paper. Several editing features include some for working diagramless puzzles.

DCMAXTRK.APP—Freeware from Double Click Software. DC Max Track determines the maximum number of tracks your floppy drive can format. ST/STe/TT compatible.

DCMSHIFT.APP—DC Mouse Shift emulates any of the modifier keys (Shifts, Control and/or Alternate) by pressing the right mouse button. Now, you can select multiple files at the desktop by keeping the right mouse button pressed while selecting (Shift emulation). Or, on machines with TOS 1.4 and up you can use the right button to move files (Control emulation). ST,STe and TT compatible. 100% assembly. Takes up only 632 bytes of memory. Another freeware program from Double Click Software.

DCMSTICK.APP—Use a joystick as a mouse! Built in accelerator features let you speed up/slow down vertical and horizontal movement independently. Another great freeware program from Double Click Software.

DCONVERT.APP—Convert self-extracting DC SEA files back to their original .ARC or .LZH form.

DFREE21.APP—Desk accessory that tells you how much free RAM you have and how much free space is on any valid drive on your system. C source code included!

FLU.APP—A demonstration of the symptoms of several ST viruses. Updated to display several new strains. If you see any of these events occur on your system, suspect a virus attack.

JEOPARDY.APP—Version 2 of Jeopardy, based on the popular TV game show. Medium resolution color ONLY.

OMNIBUS2.APP—A very nice terminal program from Germany. Has all the features you'd expect in a commercial package. GFA Basic source code included. Docs and program translated into English!

ON_SCHED.APP—Shift and scheduling calendar. Create employee shifts, print calendars and shifts, calculate hours worked and more. If you've been shifting your employees using pencil and paper then this program is just what you need! Mono ONLY.

PFXPAK2.APP—PFXPAK uses LZH compression to pack executable files, then adds a piece of self extracting code to the beginning. You save disk space by compressing files, but they still run normally from the desktop. A HotWire "block" is included, which makes a nice shell. If you don't have HotWire, a nice GEM shell is also included.

SCRNSAVR.APP—Non-resident program—you run it when you need it! For both MONO and COLOR; does *not* mess with your palette settings.

TAX90LDW.APP—Two spreadsheet templates for LDW Power to be used in preparing 1990 Federal Tax Form 1040 plus Schedules A & B. One template resembles 1040 & Schedules with formulas to compute totals and tax computation, including exemptions. The 2nd template aids in assembling raw data on income, interest, dividends, withholdings and various categories of deductions. Requires LDW Power.

TLBB15.APP—The Little Black Book 1.5 allows you to store BBS names, phone numbers, sysop names, system passwords and your passwords for all BBS systems you call. New Dial command. Works on color and mono systems. This accessory prevents you from forgetting or losing your passwords.

TURTLE.APP—Update to George Woodside's Turtle hard drive backup program. Includes support for the TOS 1.4 method of using the archive bit, while maintaining support for earlier versions. Improved RAMdisk management and now displays setting of most options on the desktop.

UNIVPIC.APP—The Universal Pictures Demo from Finland. A nice demo showing spaceships flying around in space. Works on ST/STe/TT. Color only. NOTE: May have problems with some AUTO programs/ACCs.

VKILLER.APP—Updated version of the ST Virus Killer utility by George Woodside. Recognizes several new viruses and adds a number of new features.

WEBSPEED.APP—Combination "bouncing line" demo and qualitative line-drawing speed test. Can your hardware/software accelerator live up to this frivolous test? Entertaining, too! Works as a program or accessory on color and mono.

WHOSANE.APP—Try to bomb Saddam on the head. He's a fast little devil, so move quickly. Best in color but will run in mono.

Readers can purchase this disk from their local AIM Participating user group or by sending $6 ($5 + $1 S/H) to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. Please specify the March '91 disk when ordering.

Five Good Reasons to Attend the Windsor/Detroit International AtariFest

WINDSOR/DETROIT
19 WAUG 91
INTERNATIONAL ATARIFEST

WINDSOR/WASHTENAW ATARI USERS' GROUPS

It's Unprecedented: This is the *first ever* US/Canadian International AtariFest. Representatives of both Atari US and Atari Canada will be onhand to show off their products and answer your questions.

It's BIG: The 11,000+ sq. ft. exhibition area will be filled with vendors, dealers and user groups from across the US and Canada.

It's Fun: Meet other users with similar interests and attend informal show get-togethers. If you've never been to an Atari computer show, you owe it to yourself (and your computer) to attend this one.

It's Educational: Seminars on topics such as Hard Drives, Speeding up Your ST, Online Services, BBS Systems, Desktop Publishing, Emulation and more give you in-depth, practical information to help you get more out of your Atari. In other words, the show is not only fun, it's good for you!

It's THE Midwest AtariFest for 1991!

Exhibitors Include:

Atari US
Atari Canada
Branch Always Software
Canoe Computer
Clear Thinking
DA Brumleve
Double Click Software
ISD Marketing
Micro Creations
Musicode Software
Nice & Software

SOFTWARE PIRACY hurts BIG companies.

But it ***KILLS*** small companies.

Have you ever heard this rationalization for stealing? "Big software companies aren't hurt by one or two pirate copies of their programs."

Well, the truth is that many of the best Atari software houses are NOT big companies -- they're small businesses with few employees. Many of the best programmers and developers are Atari enthusiasts like you. And the loss of just a few sales due to software theft can help drive them out of this comparatively small market.

The next time you're tempted to give or receive a copy of a commercial program, consider how piracy affects Atari software developers and the future of Atari computers.

Atari Developers

AAAUA ATARI 8-BIT USER GROUP

Alamo Area Atari User Association (AAAUA),P.O. Box 79-1426, San Antonio, TX 78279-1426

The AAAUA is an Atari 8-bit user group serving the greater San Antonio area. General meetings are held on the first Tuesday of each month at the Balcones Heights Community Center, 107 Glenarm, San Antonio, Texas, from 6:30 to 9:30 PM. General meetings feature a presentation and small group problem solving. Each third meeting we have a swap meet and computer workshop.

Members receive a subscription to AIM as part of their benefits. Dues for regular family membership are $24 per year or $15 for six months. Dues for "Subscribing" membership has been increased to $15 per year domestic and $18 per year for most foreign countries due to increased costs. Subscribing members receive a subscription to AIM and (FR)ANTIC, and have access to our P.D. Library. For further information, call Al at (512) 492-6633.

Presidential Ponderings by Alvan Sherrill

It is interesting to hear people (still) arguing about how much better their computer is than someone else's because it is so much faster or that it has so much more memory. There is no doubt that a faster machine will do things faster, other things being equal. And there is no doubt that a machine with more memory can hold more information than one with less memory. Did I really have to make that observation? Perhaps so.

There are two things about our CLASSIC 8-bit computers that we need to remember. First, it is a CLASSIC. We own it because we enjoy working with it. We are not caught up in the rat race to see who can have the lastest, the fastest and the most ram. That, my friends, is a neverending pursuit. There will always be something newer out that will outshine our computer in some respect. Do we have to keep up with the Jones'? Shouldn't we take pride in being able to do everything we want to do with our ten year old technology? Shouldn't we take the same pride getting high productivity from our 8-bit computer as the owner of an antique automobile takes in his immaculate vehicle?

We don't own our 8-bit because it is the latest; we own it because it is a fine piece of engineering which represents a major milestone in computer development. If we need more performance than our CLASSIC can deliver, we'll purchase a machine that will meet our needs. But sell our 8-bit? Never.

The second thing that is seldom considered by the user who is forever chasing the latest tecnology is that the Atari 8-bit will do everything that 90% of the users will ever need a computer to do. The rest is pure status symbol. Who needs more than a good word processor, a data base and possibly a spreadsheet. If you like, there are music and art programs and a myriad of others out there, too. If you are into games, there are more games than you could possibly master if you spent all of your spare time playing them. If the same printers are used, who can tell whether a letter was printed with an Atari 800XL or an MSDOS 386?

If you need a computer with more speed or storage capacity, by all means get it. And if you fail to see the beauty or usefulness of a fine CLASSIC computer, sell it or give it to someone who does. I own a more powerful computer, but I can't imagine not having my modest collection of Atari 8-bit CLASSICS.

If you agree with me, help spread the word! Think Atari. Think Versatility. Think Fun.

NOTICE TO CLUB OFFICERS

If we don't already print your club's labels (i.e, your club signed up for a year) then this note is for you! It would help us greatly if we could change the way we handle the mailings.

From now on, we would like your membership info sent to us in ASCII format so we can lump all lists together and just print one set of mailing labels. This will save a little on your mailing costs, and you don't have to wear out your printer as much!

Right now, we're spending a lot of hours cutting each label up and sorting into zip code order, when it really makes more sense to make the computer do it! If an ASCII list isn't possible, please talk to us to make arrangements for your club. Thanks!

January Meeting—Our January meeting was our annual Disk Swap. Each disk in both our ST and 8-bit libraries was on sale for $1 each. Overall, turnout was good.

Our BBS has changed! We have dropped FoReM, and now use the STark BBS software. The name has also changed to "The Dimension's End BBS". Give us a call today, 716-436-3078, 300/1200/2400 baud, 53MB online.

Atari Computer Owners Resource Network
Fort Wayne, Indiana

ACORN, the Fort Wayne area Atari users group, meets at the Georgetown branch of the Allen County Public Library on the first Saturday of each month beginning on at 10 AM. Annual membership dues are $18. Call our BBS at (219) 744-1396 for more information or write to us at ACORN c/o Ken Helms, 3627 Iowa Court, Fort Wayne, IN 46815.

CALENDAR: Tentative schedule for the demonstrations at the monthly meetings are: February, Computer Utilities; March, Business Software; April, Programming Languages; May, Music; June, Telecommunications; July, Three Rivers Festival

Notes from the January meeting: Our first meeting of the year is traditionally a GameFest and this year was no different. About 30 ACORN members braved the snow to come and have some fun. Karl Fadus brought his XEGS and gave those interested a chance to use the light gun with several programs. Several STs were set up and running multiplayer games including MIDI Maze and Falcon. Four members played Risk until the program crashed. Except for a couple of serious bugs, it seems to be a good adaptation of the board game. We also got to see Powermonger, a new game from the folks that published Populous.

There was no business meeting conducted at the January meeting.

Notes from the Officer's meeting: The officer's are preparing a formal agreement with the local IEEE chapter. It is hoped to be mutually beneficial with them gaining a BBS node and an established forum for holding meetings. We will benefit financially with their support of an expanded BBS. If you use our BBS then you will know that we have been having hard disk problems. Kim has not decided what actions need to be taken at this point. Mark your calendar, July 13 will be the first day of the Three Rivers Festival and we will be back for the fourth time with The Magic of MIDI Music and Much More!

Plans for future meetings: Business software and programming languages are planned topics for the March and April meetings. We have the Georgetown branch library meeting room reserved for our usual times (10 AM to 2 PM) for March 2, April 6, and May 4.

ATARI FEDERATION

Regular meetings are held at the VAFB Federal Credit Union, Vandenberg Village, Califorina on the first Monday of every month at 7:00 P.M. Dues are $10 for individual or $15 for family membership. The Atari Federation maintains a PD software library for both 8-bit and ST computers.

Treasurer	Alan Brewster	(205) 591-9906

Club dues are $15 for regular and $25 for advanced. Advanced includes an AIM monthly disk, specify ST or 8bit. BACE meets the second Monday of every month at 7pm in the Vestavia Hills Public Library, downstairs.

For membership info, call Alan Brewster, or the Matrix BBS Conference #7 (205) 323-2016, or 251-2344, and leave a message.

BRAG ST

Buffalo Region Atari Group for ST's

BRAG ST was founded in 1987 to serve Atari ST owners in the Western New York area. General Membership Meetings are held on the third Thursday of the month at Erie Community College North Campus, Room S-105 in the Student Center. Setup begins at 7:00 PM; Meeting starts 7:30 PM. The Board of Directors meet on the the first Tuesday of the month at the Your Host Restaurant, Harlem at Sheridan at 7:30 PM. All are welcome to attend. Piracy will not be tolerated at any BRAG ST function.

BRAG ST, PO Box 1035, Buffalo, New York, 14225

Chairman	Mark Pierro	(716) 691-7844
Vice Chairman	Ken Malark	(716) 683-1272
Finances	Gerry Genson	(716) 877-1328

Public Relations	Harvel Hontz	(716) 689-8074
Graphics	Dick Kersting	(716) 839-0494

Minutes From the December 22, 1990 General Meeting

The meeting was opened by Chairman Mark Pierro at 7:30pm. In the spirit of the holidays there was soft drinks and egg nog purchased by the club, and cookies, fruit cake and other goodies brought in by the members for all in attendance.

The club's newly purchased TV/monitor was on display and being use for the first time, nice to finally be able to see what was going on without 'being in the front row'. The AIM DOM listing was passed around for review for January's AIM DOM.

The first demo Word Up 3.0 was very well presented by Gerry Genson, who said he had all the bug fix patches if anyone was interested in getting the program.

At this point was our break/raffle. The raffle prize was a fruit basket won by Dave Ryznar. The January AIM DOM, Hac-Man II and club library disks were on sale.

The next demo was of Gerry Genson's Super Charger, the plug in, no soldering, no take apart, no put together IBM emulator. A number of different programs were run to show how it handled graphics, data bases, games, etc. Also shown was how it could be used a 1 meg ram disk for you ST (freeing up lots of memory).

The meeting closed at 9:15 pm.

At the January Board of Directors meeting the following officers were relected as follows:

Mark Pierro - Chairman, Ken Malark - Vice-Chairman, Gerry Genson - Treasure, Joe Rogozinski - Secretary.

B.R.A.C.E.

Bluegrass Region Atari Computer Enthusiasts

B.R.A.C.E. (Bluegrass Region Atari Computer Enthusiasts) meets the third Sunday of each month from 1 - 4 PM. Current membership dues are $15 per year for an individual membership, $20 per year for a family membership and $10 per year for an associate membership. (An associate membership includes receiving the monthly newsletter, but excludes the use of the library.) Members of have extra privileges on The Abyss BBS (606) 223-2782.

CDACE

Capital District ATARI Computer Enthusiasts

The Capital District Atari Computer Enthusiasts was founded in 1981, is located in Albany, N.Y. and serves Albany, Schenectady, Rensselaer, Saratoga and surrounding counties in upstate New York. XL/XE meetings are currently held on the third Wednesday of the month and ST meetings on the last Wednesday of the month. CDACE meetings are held at the Computer Cellar, located in Westgate Plaza, Albany, New York.

The club has extensive public domain libraries for both computers which are available to members beginning at 6:30 PM on meeting nights. ST-based disks are priced at $2 while the XE-based library continues to remain free to all members.

Dues are currently $20 per year for each family. This includes a subscription to AIM magazine, full access to the club BBS, and our monthly newsletter. The club actively promotes the use of all Atari computers through demonstration and application and welcomes non-members and share ideas.

President	Bob Thompson	518-439-5356
ST VPresident	Jim Bage	518-583-2106
XE VPresident	Ian Herrick	518-465-8121

COOKEVILLE ATARI COMPUTER ENTHUSIASTS

Cookeville, Tennessee

Cookeville Atari Computer Enthusiasts—c/o Robert Pecora—280 Capshaw Drive—Cookeville, TN 38501—Cookeville A.C.E. meets on the first Saturday of the month at 1:00 p.m. at the Putnam County Library in Cookeville, Tennessee.—Cookeville A.C.E. caters to Atari ST and 8-bit computers and is supported locally by The Generic BBS, Terry Rapp - Sysop.—C.A.C.E.

President	Dan Hale	(615) 526-8002
Secretary	Robert Pecora	(615) 528-7116

January Club Report:

Everyone has confirmed receiving their first issue of Atari Interface Magazine this month and everyone was very pleased with the magazine's quality, especially when regarding the price. Other club benefits are being considered for the future to make belonging to CACE more and more attractive.

At the last meeting on January 5th, 1991, we discussed plans for an upcoming computer show at the Cookeville Mall like the ones we've had there previously. Tentative plans have been set for after Easter around the first part of April. Also discussed were future computer classes for our members after our regular meetings. Our first class was held after this meeting and covered an "Introduction to the Atari ST and the GEM Desktop". New members found it informative. A new edition of the club software library was circulated and the listing was made available on The Generic BBS for download at 432-5015. See CACE_LIB.ARC in the Atari ST files area. Elections were put off until next month. The specs for the new Atari MEGA STe were displayed and talked about.

Class for next meeting will be on "Telecommunications with the Atari ST" and will show how to get on-line and what "modeming" has to offer. Local "sysop" of The Generic BBS, Terry Rapp, will be solicited to speak about his bulletin board system and the features he makes available to the computer community.

For those of you that haven't paid your $10 yearly dues, please make an effort to get them in as soon as possible. Dues are due to be paid by December for everyone. This will make it easier to keep up with. If a member joins after that, he will pay only for the portion of the year that remains. Several member's dues were paid by the club in November. If you have received Atari Interface Magazine in the mail and you haven't paid, then you need to get your $10 in.

That's about it for this month. Hope that you all have a very successful new year and may 1991 be indeed, "The Year of Atari"!

C.O.A.C.

Central Oregon Atari Club

Dedicated to Central Oregon Atari Users and Enthusiasts Since 1986

President	Bob Stiles	(503)389-5206
ST VP	Jim Downes	(503)382-0123
8-Bit VP	Mark Hitson	(503)648-0513
Secretary	Marly Rickard	(503)389-2032
Treasurer	Glenn Dulin	(503)382-3956

Address: P.O. BOX 6824, BEND, OR 97708

Our membership dues are $12/Yr. $1/Yr for each additional family member. We meet the FIRST SATURDAY of the month at 5:00 PM at the Ann Rita Conference Center, which lies just in front of the St. Charles Hospital on Neff Rd.

As you may have noticed above that there has been a changing of the guard. Congratulations to all upon your prestigious rise to power and fame as exalted leaders of the Central Oregon Atari Club. I trust your move into your new executive offices high atop the COAC Towers will be a smooth and pleasant one. Of course you get the high salary and bonus's along with our liberal medical benefits and pension plan. Yet, none of these benefits shall overshadow the fulfilment and gratification one gets from lording it over the rest beneath your lofty feet.

Our X-president Norman Moore actually got tired of lording and so declined the nomination. Bob Stiles is now our new president. He wasn't really aware of what he accepted...he thought he was accepting to be first in line at the cookie and refreshment table. You need to pay close attention at our meetings. Or else!

Bob Kanski was overthrown in favor of Jim Downes due to Bob's militant behavior, it seems he wanted to takeover all the neighboring Atari Clubs. The membership found this unacceptable since the nearest club is 150 miles away. He kept muttering something about ballistic misseles!??

Nancy Kanski declined the nomination for Secretary. Being a female she thought that having to share the Executive Washroom with all the men was too much, she even wanted her own! How selfish! I know the men, being the magnanimous and gracious fellows that we are, didn't mind sharing!

Marly Rickard has now replaced Nancy as Secretary. In Marly's two hour campaign speech he promised everything under the sun. Mostly, he promised to make a nuisance of himself..it seems most people liked that part. Who am I to question the wisdom of the majority.

I, myself, managed to keep the Treasurers position...do you realize how much it costs to bribe people these days?

We thank each of the out-going officers for their fine work and caring efforts. It was sincerely appreciated.

We changed our meeting time to the FIRST SATURDAY of the month. Till next time, Glenn.

CRAG Calumet Region Atari Group

CRAG Calumet Region Atari Group PO Box 10995 Merrillville, IN 46411-0995 CRAG, is a club for users of the Atari ST, STE and MEGA ST computers. CRAG meetings are held on the second Wednesday of every month at Broadway Music, which is located in Greentree Plaza, at 1509 West 81st. Ave(U.S. 30), Merrillville, Indiana. Meetings begin at 7pm.

Membership in CRAG is open to anyone. Dues are $15.00 a year and entitle you to a subscription to Atari Interface Magazine, as well as discounted prices on CRAG's Public Domain/ShareWare Library disks. Library disks are double sided. Cost per disk is $2.50 for members $4 for non-members. For more information call:

Jeff Coe (219) 663-5117 Randy Noak (219) 663-6912

Eastside Atari Users Group

The Eastside Atari User Group, (EAUG), meets on the first Monday of every month, 7PM, at the Alton Square Mall Community Room, in Alton Il. All meetings are open to the public. No club dues. FACCS

First Atari Computer Club of Spokane

We currently own and maintain a 24-hour Bulletin Board System (BBS), open to everyone with a 300, 1200, or 2400 baud modem, called the Atari Zone 509-326- 5741.

Since we currently have renewal dates scattered throughout the year, please check your card for your current expiration date. Remember, once your membership expires we are no longer able to send your AIM Newsletter or allow you to remain at the F.A.C.C.S. level on the Atari Zone. To prevent interruption in your F.A.C.C.S. services please renew by the expiration date on your card.

FRACUS BBS		(209) 251-5338
SysOp	Mike Pound	

The FRACUS user group meets the last Saturday each month, at 6PM, at the Four Seasons Moble Home Park Rec. room in Fresno, CA. We have a large public domain library with over 400 programs. The club also has a 24hour BBS. All 8bit Atari users are welcome to our meetings and to use our BBS (members have an additional sig on the BBS). Dues are currently $20 annually or $5 quarterly which includes a subscription to AIM and issues of our periodically published newsletter. We currently have 16 active members and are continuously growing.

G.T.A.U.G.

The Newsletter of the Golden Triangle Atarian

The GTAUG has been 'around' since 1981 and supports both the 8-bit and 16-bit communities. Meetings are held the first Tuesday of each month at a location announced in the previous meeting.

At present our dues are $24 per year (Our year begins in September.) and is pro-rated at $2 per month for new members the first year. Since our nearest dealer is 90+ miles away, it is imperative that we support each other. It is for this very reason our group is a fairly close and diverse. We support all facets of Atari computing from 8-bit to Spectre/Mac to IBM and MIDI.

The LACE Club Meets in the basement of the Clearfield Library every second Wednesday of the month at 7 p.m. Mark your calendars for the next three meetings. March 13, April 10, May 8, 1991

M.A.C.E.

The Michigan Atari Computer Enthusiasts

Members of MACE receive, as part of their dues, Atari Interface Magazine. Members are also entitled to purchase disks from the 8-Bit and ST public domain software libraries. 8-Bit disks are $3 each, and ST disks are $4 each. As an added bonus, if you purchase three (3) disks from either library you will receive a fourth disk of your choice at absolutely no cost. Non-Members may purchase disks at a slightly higher rate. Mail order is also available.

For a catalog of current disks in our libraries, send $2 to:
MACE, P.O. Box 2785, Southfield, MI 48037

MACE meetings are held on the Third Tuesday of each month at the Southfield Civic Center at 7:30pm. The Southfield Civic Center is located at 10 1/2 Mile and Evergreen Rd, one half mile south of the Evergreen exit on the new I-696.

Meetings are in the small pavilion, room 115. Parking is available in the parking garage below the pavilion or in one of the many parking lots on the Civic Center grounds.

If you have any problems with getting to the MACE meetings, please feel free to call on a MACE Officer to relieve you of your confusion. We are always glad to extend a helping hand!

Please come and join us! We are awaiting your visit!

MID-OHIO ATARI USER GROUP

The Mid-Ohio Atari User's Group (MAUG) is again without a place to meet. If you know of any apropriate place which is available, please contact Chuck Steinman as soon as possible.

MAUG membership dues are $8.50 per year for residents of Ohio, and $12.50 for non-residents. Included with membership is a subscription to the Atari Interface Magazine (AIM) at no extra charge. ST users may elect to also receive the AIM ST Disk of the Month, for a total fee of $20 per year ($30/year for non-Ohio residents).

Please make payments out to Chuck Steinman/Maug, and mail them to Post Office Box 134, Ontario, OH, 44862. Payment must be received by the 10th of the month preceding publication, to assure receipt of that month's magazine. Please notice your membership expiration date is is printed on your address label, and renew at least 30 days in advance of that date to assure uninterrupted service.

Middle Georgia Atari Users Group

M.G.A.U.G.

The Middle GA Atari Users Group is the sole Atari Club in the Middle Georgia area. We are composed of 60 members of which approx. half are ST users. Club president Pete Miller can be reached by phone at 912-328-8758. The MGAUG address is 115 Feagin Mill Rd., Warner Robins, GA 31088. MGAUG meets the second Sunday of each month at 1 PM at the Warner Robins Library. Annual dues are $5 with the newsletter optional. Use of the club library is free to all paid members.

Well the January meeting was great with Bob Blackshear showing up with his computer and a great turnout. The talk of the meeting was the 85Meg hard drive I purchased from D&P computers. With $40 of the club's money I purchased 40Megs of public domain software. This will give us approximately 120Megs of Public Domain Software.

I would like to extend a special welcome to Marvin Barnes a new member in the club. Marvin is the owner of a 1040ST color system and is new to computers. WELCOME.

There is more news of another shakeup at Atari in the sales division. It seems John Church (head of sales) and most of his staff have been fired-- for poor sales. No joke Atari, you finally noticed.

As of last meeting we have started having 2 that's TWO public domain disks offered at each meeting. One disks is the AIM disk of the month and the other disk will be made of files chosen by myself from the 40 MEG of public domain from my hard drive. For registered members of the club just bring 2 blanks to the meeting and swap out with the PD disks on the magazine table. For those that don't have any blank disks you can purchase the month's PD offering for $1 per disk.

That's about it for this month. Be sure to attend the next meeting and bring a friend. The next meeting is March 10th.

Nashville Atari User's Group
N.A.U.G.

Nashville Atari Users' Group P.O. Box 121752 Nashville, TN 37212. NAUG meets on the third Thursday of each month from 7PM to 10PM at the Cumberland Museum and Science Center. Membership dues are $24 per family for the entire year. With your membership you will receive our local newsletter, Atari News, a subscription to Atari Interface Magazine, access to the club's 8-bit & ST Public Domain/Shareware libraries, any group discounts on products, and entrance to all club related functions. We have an Associate Membership for $12 per year. With this membership, you will receive Atari News, AIM and access to our 8-bit & ST PD/Shareware libraries. People joining during or after the month of July pay 1/2 the yearly rate. Visitors are welcome to all meetings.

NSAUG

Novia Scotia Atari Computer User Group

The Nova Scotia Atari Computer User Group (NSAUG) is a registered non-profit organization dedicated to sharing information about computing on Atari computers. We will be meeting as one group starting in October (date, place and time to be announced). We own and operate XEST BBS (at 856-0101) which is accessible to all owners of Atari computers. Non-members have limited access to features of the BBS. We are always looking for new members. If you own or are thinking about buying an Atari computer, come on in and see what we do.

We can be contacted either by phone through the executive board or at one of our meetings or by writing NSACUG, 170 Nestor Crescent, Darthmouth, Nova Scotia, B2W 4B1.

President, Treas.	Mike Hundiak	429-2639
ST Vice President	Dave Mason	826-7101
XL/XE Vice President	Hilary McCarron	275-3688
Secretary	Marlene Abriel	434-4430
Newsletter Editor	Steve McCarron	275-368

O-ACEs

O-ACEs is a non-profit group interested in getting more out of Atari computers. We are NOT affiliated with Atari Corp. or any other commercial organization -- we are there for YOU! We cover BOTH 8-bit (including the 400/800, XL, XE, and XEGS series) AND 16-bit (ST series) Atari computers. We meet twice each month (except November and December) on the 2nd and LAST Wednesday each month. Doors open by 7:30 pm at La Vista Recreation Center, 8116 Parkview Blvd. (just off 84th Street, south of Food-4-Less and east of 84th at the light)

FIRST MEETING: (2nd Wednesday) Covers news, views, and decisions that ALL members might be interested in. FOCUS MEETING: (LAST Wednesday) Concentrated information on a single topic (such as word-processing, spreadsheets, music composition, desktop publishing, etc.)

Call 592-5427, for more info on O-ACEs!

PORTS ATARI P.A.C.E. COMPUTER ENTHUSIASTS

Membership to PACE is $30.00 per year or $9.00 per quarter. General meetings are held at 6:30pm on the third Sunday of every month. In the event of a holiday, a new date will be chosen and will be posted within the pages of this newsletter and on local Bulletin Boards. Membership includes a monthly newsletter, monthly meeting, FREE Disk-of-the-Month, access to our BBS, FREE printer ribbon re-inking, and FREE copying priveleges to our VAST collection of 8/16 bit Public Domain programs. Ports A.C.E. is an alliance of families with a mutual interest in the Atari Computer and is an independent, non-profit organization. PACE hardware assets: 130XE, 1050 Drive, MacInker and a Supra 300 baud modem.

Any written correspondence should be addressed directly to PACE Tracy Hendershot, 4835 Crosley Avenue, Duluth, MN 55804.

President	Tracy Hendershot	525-1058
Vice President.	Larry Nadeau	525-7430
Sec/Treasurer	John Zupansic	394-9326
STLibrarian	Don Henricksen	729-6309

It's difficult concentrating on pleasant thoughts when we are currently waging war on Iraq. Hope ol' Saddam assumes room temperature soon and saves the Iraqi people from his murderous reign. Now, early in the morning of Jan. 17th, on to the business of running our loyal Atari user group.

Reflecting over the past 6 years, PACE has faithfully been available to those needing advice or a "shoulder to cry on" when equipment or software fails to operate properly. We plan on staying around for many years to come. Many new and exciting products lie ahead. Most recently, Atari Interface magazine and its monthly disk were significant additions to our group. Attend PACE's monthly meetings and see what you've been missing!

Our 520ST-FM has finally arrived after having been back-ordered for so long. Hope it is a good sign that Atari can't keep up with demand. I have been in touch with our friends at TASTE -- Thunder Bay, Ontario. Thought I would enlighten them about AIM and what an asset it would be for their group to join.

Sam Tramiel, chief executive officer of Atari, was quite vocal at January's Consumer Electronics Show in Las Vegas. Tramiel commented about Nintendo's easing policy about third-party developers creating software for its video-game players. "It was very frustrating. We tried to get the good titles, but couldn't because of the restriction. We just kept banging our head against the wall and got nowhere." Atari's hand-held game unit called Lynx competes directly with the Nintendo Game Boy.

Next meeting is Sunday March 17th, Androy Hotel at 6:30.

PHAST - Phoenix Area ST

The PHAST monthly meetings are held on the second Saturday of every month at Devry College 2149 W. Dunlap Ave. Phoenix,Az. from 12 to 2pm in room #109.

President	Robert Dytmire	
Treasurer	Wayne Myers	(602)264-5737
Membership/Sgt. at Arms	Mike Zachary	(602)273-1185
Recording Secretary	Jim Keho	(602)934-9181
Disk Librarian	Dave Thorson	(602)954-6033
Publications Librarian	DonThompson	(602)486-1593

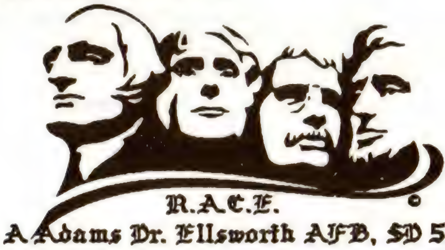
Club Minutes for Sat. January 12, 1991 -- by Jim Keho

YES! PHAST is still alive! And probably more alive than you really think! <grin> Today had to be the most interesting meeting day in PHAST's history! No not because of the LOW turnout! That seems to happen every meeting! Where were you??

The way it turned out there was TWO meetings today, one at the regular 10am-12pm. And then at the new time 12pm - 2pm. and new location (Devry College 2149 W. Dunlap Room #109 Note: NEW location and time above!) This will be the meeting location and time for future meetings! It may have seemed a little confusing, but it all worked out! And the new meeting place looks great and should work out better! (No noisy freezers!) Thanks to those that figured it out and could make it!! And everyone won't want to miss the next meeting, more on that later.

First business on hand, there is a new officer for 1991 and some that are hanging on for another year, including me, yes I'll be continuing as Recording Secretary. The new officer is Wayne Myers, taking over the position of treasurer. Welcome to PHAST, Wayne!! And also, Dave Thorson has taken over the disk library. Which we really needed!! Thanks Dave! The Vice President is still open, If you would like to take over this position just let an officer know at the next meeting! Help in supporting your club is greatly needed!!

OK, I'll only give brief minutes for the second meeting today, the meeting started about 12pm. There was a little discussion/comments (nice) about the new meeting place. Then we discussed the upcoming (Feb.91) meeting with special guest Bob Brodie (What's there to discuss right??) Heck yea, it was voted to invite him here again!! <grin> This may already be history by the time you read this issue of AIM. But just in case, If all goes as planned we will have Bob Brodie here for the Feb. 9,1991 meeting!! He'll be bringing along the new Atari TT and MegaSTe for us to see.. Should be great!! And one you won't want to miss... Be There!! Well that's it for this time, see you Sat. Feb. 9th!



R.A.C.E.

9512 A Adams Dr. Ellsworth AFB, SD 57706

The Rushmore Atari Computer Enthusiasts is a nonprofit organization of Atari computer owners not affiliated with Atari Corp. Meetings are held on the third Saturday of each month, 2pm, at the Westminster Presbyterian Church. Annual dues are $12 for basic membership and $15 for membership and newsletter. RACE offers the Black Hills Atari owner hardware and software support and the largest library of public domain Atari software in South Dakota.

NO PIRACY WILL BE TOLERATED AT ANY RACE FUNCTION!

President	Rick Burton	(605)-642-5353
V. President	Duane Charter	
Secretary	Mike Douglass	
Treasurer	Mike Randall	
NL Editor	Mike Harbison	

R.A.C.E.

Eric Schofield	[President]	851-5134
Brian Casper	[Vice President]	851-8092
Lewis Midyette	[Secretary]	828-4319
Tony Manino	[Librarian]	851-8092
Jim Harrop	[Treasurer]	851-5134
Robert Yates	[BBS Sysop]	552-7053

Spring is upon us and the computer world is as exciting as ever! To start out with, the club is growing in leaps and bounds. There have been some changes made in the structure of the club too. Back in January, Jim Harrop graciously stepped forward to take the role of Treasurer. Not only that, but Lewis Midyette has come forward to take the role of Secretary. Robert Yates also his BBS up and running and this will serve as the club's local BBS! Please welcome Robert as our new BBS Sysop, Lewis as our new Secretary, and Jim as our new Treasurer. We finally have all officer positions filled and I can relax a little bit now.

If you haven't made it to the last few meetings, you probably haven't heard about Desktop Pros. Walter Gremillion and I, along with a few other people, are trying to open an Atari dealership here in Raleigh. Hopefully, we'll be open by the time you read this. NO MORE MAIL ORDER!! Support your local dealer! You will receive discounts off hardware and software by being a club member.

Is it too early for me to mention -- ATARIFEST? I don't think so. It's an event that I think we all enjoy and you can find lot's of bargains there, just ask Don Nelson! Atarifest is in October and in the next few months, we'll start making plans to go up as a club (you get discounts)!

It's almost time to reelect club officers too! We'll be discussing these issues at the next club meeting which will be March 19 from 7-9 p.m. at the Richard B. Harrison Library. Barry Clayton will be showing us DC Desktop on the Atari ST!

The club is now offering the AIM disk as our club disk! Look through your AIM and see what it has to offer you. If you are interested, we can save you $26 from the normal subscription rate of $50! You can get an entire year of disks for only $24! It's a good deal and I encourage everyone to subscribe. Just send a check for $24 to Jim Harrop, 4360 Hunter's Club Drive, Raleigh, NC 27606.

Each meeting will now feature an overview of the club disk with demonstrations of some of the programs and a main feature presentation. The meetings are going to be FULL of interesting events!

That's it for now gang, call any of the officers if you need help with *anything!* We'll see you on the 19th.

STANCE

President	Claudette Tishcler	226-5644
Vice-Pres	Gary	521-2855
Treasurer	Kathi Koenig	892-0881
Newsletter Ed	Joseph Adato	449-6881

The ST Atari North Coast Enthusiasts (STANCE) is an independent, not for profit Atari computer user group and is not affiliated with Atari Corporation, or any of its affiliates, in any way.

$12 per Year with a one time sign up fee of $13.00.

STANCE club meetings are held every third Monday of each and every month at B & G Electronics, (located at 15729 Madison Ave., Lakewood, Ohio 44107) starting at 7:15PM

RACC
ROCKFORD ATARI COMPUTER CLUB

WE'RE NOT JUST PLAYING GAMES ANYMORE!

Rockford Atari Computer Club is comprised of avid, dedicated users of all Atari computers. We support and promote the use of 8-BIT, and ST/MEGA machines with extensive PD libraries, monthly meetings, and semi-regular SIGS.

We have had a change of meeting place this year, as our previous site is being used for adult education on Saturdays. We may be able to secure a regular space there, if we can agree to meet at some other time/day (possibly evenings?). Any suggestions, or other alternatives should be mentioned at the meeting. Our regular business meeting is held from 9 to noon, the third Saturday of the month.

We have accepted the gracious hospitality, of the Springbrook Congregational Churches as an alternative meeting place. It is located, off Alpine, just as you make the turn onto Springbrook road, from Spring Creek road. Our mailing address is 3902 15th Avenue 1 - Rockford, IL 61108. Our phone number is [815] 397-5316.

S.A.G.E.
SPECTRUM ATARI GROUP of ERIE

SAGE, PO Box 10562, Erie, PA 16514-0562

The Spectrum Atari Group of Erie, PA was founded in December of 1984 to provide communication and support among owners of all Atari computers. Our newsletter is the SAGE Scroll which is published monthly. In addition to being distributed to all of our members, the Scroll is exchanged with over 50 other Atari computer user groups nationwide. SAGE maintains extensive libraries of public domain software for both the Atari 8-bit and ST computers.

The SAGE BBS has been operating for 5 years at 814-833-4073 (2400 bps, 24 hours). The SAGE BBS offers public access to all of the message bases, and, in cooperation with the Erie County Library offers a unique on-line reference service known as GET R.A.D. (Get Reference After Dark).

The Spectrum Atari Group of Erie meets on the third Sunday of each month at 2 PM at St. John's Lutheran Church in Erie, PA. We also have SIG meetings monthly covering Telecomputing, the ST/Mega/TT computers and programming in GFA BASIC.

President Dennis McGuire 814-833-4724

STUN

The ST Users Network -- supporting users of the Atari ST, Mega, and newer technology computers. P.O. Box 27285 Salt Lake City, Ut. 84118. STUN operates a 24 hour BBS -- (801)272-4243. Open meetings are held on the 3rd Wednesday of each month at 7 P.M. in the Murray High School.

SEVAC

South East Valley Atari Connection meets the third Saturday of each month at 10 AM at 3234 S. Fair Ln. (Eaton Business Park, just off of 48th Street and Southern), Tempe, Arizona. Yearly membership is $12.00. Membership includes reduced prices on PD ST and 8-bit libraries and monthly newsletter.

STAG Saginaw / Tri-City Atari User Group
"where the deer and Atarians play"

The Saginaw/Tri-City Atari User Group meets the last Saturday before the 18th of the month, at 9am, at the Rudy Zauel Memorial Library, on the corner of Center and Shattuck in Saginaw Township.

President	Bryant LaFrenier	(517) 835-2234
ST Librarian	LeRoy Valley	(517) 686-6796
Tres./Sec.	Marty Schmidt	(517) 792-6029
8bit Librarian	Ted Beauchamp	(517) 686-8872

Club dues are only $20, which provides support for both the 8bit and ST, and fill access to the club's Public Domain library, along with a year's subscription to Atari Interface Magazine.

The meeting was buzzing with the latest news that LeRoy Valley, our ST Disk Librarian/Tech Advisor is going to the MAC world. Due to disappointing circumstances, he determined that the ST world was not in his future. We wish him luck in his endeavours and hope to see him in the near future. We will sorely miss his help and knowledge that we have come to depend upon meeting after meeting. Jim Fleming will take over the office of ST disk Librarian.

The mall show at Fashion Square Mall in Saginaw was very exciting. We had a number of people visit our booth and if it was not for the snowstorm on the day of the meeting, we would have had some new members (that saw us at the show) at our meeting. A good time was had by most of the people participating in the show. THANK YOU FOR THE HELP TO MAKE THE SHOW A SUCCESS. We would like to thank Waldensoft for letting us store our equipment in their store overnight.

Our meeting consisted of demonstrations of some utilities for the ST. WHERE WERE YOU 8-BITERS? We only had 8 inches of snow before the meeting. Back to the meeting, LeRoy Valley demoed (his last ST demo) DC Utilities. DC Utilities had a number of utilities that can significantly enhance your ST. DC Squish appeared to lead the pack with the abilities to reduce the file size of programs but allow them to be executable with just a double click. LDW POWER was reduced from ~350KB to ~206KB. A RAM disk; ARC, LZH, ZIP, and ZOO extracter; self extracting ARC file creator; desk organizer; and snapshot utility were some of the other programs on the disk. The other utility disk that was looked at was Quick Tools. Many programs and accessories were in this package, which included: command line interpreter, control panel, environmental manager, file finder, benchmark index, DESKTOP.INF editor, quick labeler, ability to lock out (prevent read/write) hard drive partitions, quick terminal emulator, and a file viewer. Both of these packages give you a lot for your money, $23.95 for DC Utilities and $17.95 for Quick Tools. The winners for the raffle were Larry Hennard for DC Utilities and Bryant LaFreniere for Quick Tools.

For the FEBRUARY 16th MEETING: At the February meeting, we will look at low cost DATABASES. Bryant LaFreniere will demo Superbase Personal and Al Jennings will demo Base Two from Antic. Hopefully, we will have a few new members at this meeting. In March, we will look at some games for the ST.

EQUIPMENT VOLUNTEERS FOR February 16th are Larry Hennard with his monitor and Al Jennings with his 1040ST.

ST☆R
ST ATLANTA ROUNDTABLE

STAR (ST Atlanta Roundtable) Atlanta, Georgia, meets the third Monday of each month at 7PM. Membership dues are $30 per year. Each member receives a copy of AIM and PD disks. Bring a friend.

SCAT SUBURBAN CHICAGO ATARIANS

AN INDEPENDENT COMPUTER USERS GROUP

SCAT (Suburban chicago Atarians)

SCAT general meetings are held on the third Saturday of each month at 10AM, unless otherwize indicated on the SCAT BBS. The location for the meeting is College of Dupage, Student Resource Center, Lambert Road between Roosevelt and butterfield Roads, Glen Ellyn, IL. SCAT is a not-for-profit computer group for the purpose of helping people better understand and utilize Atari 8 Bit/16 bit/32 bit series of computers for business and pleasure. Meetings are open to all.

Membership dues are $20 per year per family. Membership benefits include subscription to Atari Interface magazine (AIM) and special club events. SCAT and AIM are not affiliated with Atari Corp. in any way.

Anyone wishing to become a member can just come to a meeting and sign up or call SCAT's 24 Hour Bulletin board (708) 231-7227 or write SCAT, P.O. Box 72266, Roselle, IL 60172

ST Atari Road Runners

THE #1 ATARI USER GROUP IN THE NEW HAVEN (CT) AREA

ST Atari RoadRunners is probably now the oldest continually running Atari user group in the state of Connecticut. The club was organized in March 1986 by one of the New Haven area Atari dealers and at that time we were strictly an ST club. As time went on, other Atari groups started to disband and we found ourselves in and among the 8-bit users.

We hold our meetings at Greater New Haven State Technical College, in North Haven, CT. Our meetings have traditionally been held on the first and third Thursday of each month. However, starting in January 1991, we will hold only one meeting per month and that will be on the third Thursday. The first meeting of the new year will be January 17th at 7PM. Hopefully, we will be in Room 307.

If you would like more information about ST.A.R.R., feel free to contact one of our officers listed below. And, do call the ST.A.R.R. BBS -- our sysop gets lonely sometimes.

Matthew Masserman	President	(203) 621-7007
Lou Demetriou	Exec VPresident	(203) 271-0452
Merrill Ross	VPfor 8-Bit Affairs	(203) 239-9403
ST.A.R.R. BBS (300 - 9600 baud)		(203) 421-486

SWAG

SOUTHWEST WASHINGTON ATARI GROUP

The Southwest Washington Atari Group was formally created in April, 1985; prior to that, local Atari enthusiasts met on an irregular basis. The group has been holding its meetings at 6:30 p.m. on the last Sunday of the month (save July) at Clark County Fire District #5, Station 3 on 213 NE 120th, Vancouver, WA. SWAG started out with a large following of 8bit owners and as more and more members upgraded to the Atari ST, the membership has become mainly ST owners, but 8bit is still supported. Annual dues are $12 and SWAG can be contacted at PO Box 1515, Vancouver, WA 98668.

SPACE

The Southcentral Pennsylvania Atari Computer Enthusiasts support both 8bit and ST computers. Dues are $15 per year and include a subscription to AIM and SPACE Probes. Information can be obtained by writing to us at PO Box 11446, Harrisburg, PA 17108.

Salinas Valley Atari Computer Enthusiasts

SVACE is the only Atari user group in the Monterey Peninsula area. It supports both the 8-bit and ST computers. There is a free disk of the month for all attendants, bring your own disk. Dues are $12.00 per year and includes Atari Interface Magazine. Meetings are at 7:30 P.M. on the first Tuesday of the month at the Salinas Community Center. Demonstrations and raffles are a regular part of our meetings. SVACE can be contacted at 672 E. Romie Lane, Salinas, CA 93901. Anybody interested in Atari computers is welcome.

We have had interesting meetings lately. By combining hardware from different users, we were able to scan things and print them on a deskjet. We had another meeting and again by combining equipment we connected two ST's together with a null modem. We then had demos of games that can be played by modem and a telecommunications demonstration.

The next meeting (which may have happened already) will be on MIDI. We expect to have two keyboards a number of MIDI programs and a demonstration of Sierra-on-Line's use of MIDI sounds in their games.

TACE

TINKER ACE OF OKLAHOMA

Tinker ACE of Oklahoma meets the first Saturday of each month at 1 PM (12:30 set-up time) in the Moore Public Library, 225 S. Howard, just off of SW 4th and I-35 in Moore. TACE can be contacted at 104 E. Northrup, Midwest City, OK 73110 or at the TACE BBS (405) 755-9561, 24 hrs., 3/12/2400 baud, running Oasis 4.3 software with over 60megs online storage. ST & 8bit support. Dues: Full - $20, Correspondence - $15. Dues are prorated at $1.25/month for correspondence membership and $1.66/month for full membership.

President/VP	Greg Ray	(405) 964-3765
Librarian	Chris Hamilton	
BBS Sysop	Rick Spencer	
Technical Advisor	Ron Hamilton	(405) 387-5649

TEAC

TEAC

The Educator's Atari Club

Yearly membership fee of $25 includes 6 issues of the TEAC newsletter, the TEAC Educational 8-bit Disk Library catalog and a one year subscription to Atari Interface Magazine. For more information, contact TEAC at PO Box 1024, Laytonville, CA 95454.

WACO

WESTMORELAND ATARI
COMPUTER ORGANIZATION

Westmoreland Atari Computer Organization meets the second Tuesday of each month in the North Huntingdon Township Town House, Center Highway and Brownstown Road (just off Route 30 near the Hamilton car dealerships, Irwin, PA) at 7:30 P.M.

Founded in December, 1983, WACO boasts huge ST and 8bit PD libraries. Double-sided disks are only $3 for members, $4 for non-members. Disk catalogs on disk are only $2. The $20 annual membership ($24 for family) now includes a subscription to AIM.

as well as the vocal, consumer-oriented WACO Printout newsletter which features Z*NET. Memberships by mail are welcome.

WAUG

Windsor Atari Users' Group

The Windsor Atari Users' Group (W.A.U.G.), founded in 1982, is among the oldest computer clubs in North America to serve the Atari community. We are an international family of Atari owners with members from across Southwestern Ontario and the state of Michigan.

Our club meets every third Thursday from September through June with the exception of December when we meet on the second Thursday so as not to conflict with Christmas scheduling. We meet at 7:30 p.m. at the Roseville Gardens Community Centre, 6500 Roseville Garden Drive, Windsor, Ontario, CANADA.

Our club dues are $25(Canadian) per family membership. Each membership entitles you and your family to attend our regular meetings, as well as receive the AIM magazine as well as our own monthly publication, 'exSTracts'. In addition, each membership gives you access to our ever growing public domain library, packed with programming from around the world. Each club disk sells for $4.00 (Canadian) with the occassional monthly special as offered by our club librarians.

The Wizard's Attic BBS		681-1654

WAUG!

The Washtenaw Atari Users Group meetings are held every second Tuesday of the month at 7:30 pm in the Michigan Union building on the campus of the University of Michigan on State St. at the corner of S. University in Ann Arbor.

Club dues are $15 per year and provide access to the PD library and subscription to AIM. Meetings feature demos of both 8bit and ST software and hardware. Nonmembers and questions are welcome. Officers can be contacted by calling Craig Harvey at (313) 994-5619 or by BBS at Molin's Den at (313) 451-0524.

The first meeting of the new year was held on January 8. President Craig Harvey called the meeting to order at 7:30pm (AS ADVERTISED!) while the equipment was being set up for demos.

Craig gave a synopsis of events-to-date in the continuing saga of How To Host An Atarifest, and repeated previous requests for volunteers.

Mike Olin gave a demonstration of the MiGraph hand scanner and TouchUp software. Several pictures were scanned and displayed, and some of the editing features were performed at the request of the audience. An .IMG file was selected for use in comparing printers during the February general meeting (feature topic: PRINTERS)

Mike also distributed a flyer with bench-marking information concerning the AdSpeed processor accelerator from ICD, and discussed the installation procedure while showing how it could be toggled 8<--->16 MHz on the fly without glitching data or requiring a reboot. Mike announced a group purchase plan in conjunction with Soft-House Computer Center of Garden City. Those persons interested should contact him or an officer before the February general meeting.

Bruce Urbanski showed a newsletter from Gadgets By Small describing the updates in the Spectre GCR software and also the new 68030 expansion kit for the STs.

There was an unsuccessful attempt to demonstrate null-modem file transfers between ST and XE. Unfortunately BobTerm kept reporting NO CARRIER so the project was scrapped. 8-bit users who wish to get a sample pic for printing at the February meeting can download it from MOlin's Den.

WNYAUG January Meeting

The January meeting of WNYAUG was called to order by president Mike Husband at 7:30PM.

Old Business: None. New Business: Mike reported that the Atari user group from Toronto had called to ask us for information about computer stores in the Buffalo area that still supported Atari. Kevin mentioned a few stores in the area still selling Atari software.

John K. summarized the mail received since the last meeting, which included a number of newsletters, advertizements and a letter from an Atari user in Poland that was written in Polish. Can anyone in WNYAUG read Polish? If so, we need your help on this one!

Dave reported that according to his records, the club treasury stands at $905.28. He also reported we have not received a bank statement yet, probably due to the holidays. Dave reported the purchase of postage stamps and various other routine supplies, and a new ribbon for our printer. Also mailed was the check for $25 for our donation to programmer Bob Puff.

Program Demonstrations: The theme for January was Art and Graphics. Mike opened by demonstrating how he used the Print Shop Companion's graphic editor to create a graphic commemorating Operation Desert Sheild.

Mike then proceeded to demonstrate a wide variety of Art/Graphic software and hardware using the Atari Touch Tablet, Koala Pad, light pen and Kevin's Super Sketch tablet.

The meeting was adjourned at 9:45pm.

MUG SHOT! $39.95

Parts is parts, they say, but with MUG SHOT! parts add up to a whole lot of fun and practicality. Extra data disks are available for only $19.95 so you'll *never* say, "Gee, is that all there is?". The possibilitieas are truly endless.

- Prints in 4 sizes to Epson 9/24 pin, HPDJ, HPLJ, SLM804, KXP4450 and more.
- Saves as IMG, Degas, or .MUG file.
- Works in color and monochrome from minimum 512K to TT Ram!
- Optimized for use with big screen monitors.
- Comes with a set of famous faces and a cartoon set for kids of all ages!
- Additional data disks only $19.95.

Loadable data files means infinite possibilities!

IMAGE CAT 2.0 $37.95

The complete **Graphics Cataloguer**! Can't find the right picture? Look in *your* catalogue of *your* art and find the right pic for your needs in seconds!

- Fully automatic, fully loaded. Prints up to 15 pics per page!
- Automatically prints up to 28,700 files with ONE click of the mouse!
- Catalogues *your* **GEM**, IMG, PI#,PC#,NEO,TN#,MAC,**ICE**,**NIC**,**SHP** files.
- Does not require GDOS.
- Catalogues color pics with your choice of dithering for best print quality!

Get IMAGE CAT and get the picture!

MVG $59.95

Dr. Bob's Handy Dandy **M**ulti**V**iewer **G**raphica: *ALL NEW* MVG ***version 2.0***
Do more than just touch up your graphics. And do it many times faster! Cut your editing time in half then in half again! Written in 100% optimized machine code!

- Now compatible with big screen monitors!
- Loads & saves IMG, PI3,PC3,NEO, MAC- plus saves in TRUE-MAC format!
- Built-in fonts/import GDOS fonts *without using GDOS!*
- Best Cut-n-Paste *ever* for the ST!
- Image size limited only by available memory.
- Modules now available for the Geniscan/ST™ and Migraph™ hand scanners. (for Geniscan: $14.95 • for Migraph: $19.95)

- Dr. Bob's Modules Disk #1 now available! Only $29.95!

ATARI

ATARI BULLETIN BOARD

Bill & Pattie Rayl

In an effort to revitalize their US market presence, Atari Corp. announced the hiring of ST-Report's Ralph Mariano to head up Atari's newly-formed US Marketing and Public Relations division.

This surprisingly bold move has shocked many Atarians who know Ralph Mariano as one of the most vocal critics of Atari's past policies.

When asked how he came to get the job, Ralph stated, "Actually, it seems it was mostly Bob Brodie's doing. The Atari Brass was in a meeting discussing plans for the US market and Bob recommended me for the position."

When we asked Bob Brodie why he had recommended Ralph to head up US marketing, he said, "It's the old 'user group officer strategy'." When it's time for elections, the guy who's been complaining the loudest about how the club is run one year is the guy you elect as president the next!"

Out with the Old

Atari Interface Magazine has ceased publication as of the March 1991 issue. When contacted to find out why, Editor-in-Chief Bill Rayl said, "Well, we could blame it on Atari or the market in general, but that's not very inventive...everyone's using that excuse. Maybe there is no reason." When asked about the April/May 1991 issue you now hold in your hand, Bill emphatically denied its existance.

In with the New

Antic Publishing has announced production of a sister publication to START magazine.

According to START Editor Tom Byron, the magazine is called FINISH and will focus on "the very worst software, hardware and discussion in the Atari market."

The magazine's editor, Frank Sommers (formerly of Current Notes), promises the magazine will be "filled with negative reviews and lots of depressing commentary on the how bad it is to be an Atari user."

The reason given for starting such a magazine is that it provides a much-needed counterbalance to START.

"Besides," says Tom Byron, "our new slogan of 'Everything the Atarian Needs—From START to FINISH' was just too good to pass up."

A Miracle Machine

Software Heaven, makers of the popular Dungeon Master game series, has recently announced a revolutionary new computer they are tentatively calling the "Graphic Oriented Device."

Supposedly, this machine automatically taps into every known network at bootup, recognizes and responds to human speech and thoughts, and can answer any question asked of it. According to Software Heaven's Wayne Holder, the computer can even heal anyone who touches its screen.

"The only problem we have yet to work out," says Holder, "is that the Device never does what the user tells it to do. In fact, the thing keeps outputting a list of its own commandments to its owner!"

Another possible problem on the horizon for Software Heaven is that Apple Computer is reportedly gearing up for a major lawsuit to stop the release of this new machine. In the injunction served on Software Heaven just last week, Apple claims that the Macintosh is the "one true Graphic Oriented Device."

Another Miracle?

Since the demise of Practical Solutions a couple months ago, many online users have been expressing the hope that the company would reorganize and reappear.

Well, that's just what has happened—under the new company name of Impractical Solutions. According to Mark Sloatman, the company's president, market surveys done prior to PS's demise indicated that the public just wasn't interested in anything practical. Sloatman says the new company will be more oriented to the needs of the general public.

Already, joint ventures with major small home appliance manufacturers like Sunbeam and others have been signed.

"We're coming out with a whole new line of home appliances," Sloatman admitted.

Mixmaster PC, their first new product, will be aimed directly at the gourmet chef and housewife. Sloatman says Mixmaster PC will be "the perfect tool for computerized cookery."

Other announced products include Snackmaster PC and DrinkMaster PC, both of which are "designed for the computer user who never has enough time to prepare a decent meal."

[Eds: April Fools!!]

Five Good Reasons to Attend the Windsor/Detroit International AtariFest

WINDSOR/DETROIT
19 WAUG 91
INTERNATIONAL ATARIFEST

WINDSOR/WASHTENAW ATARI USERS' GROUPS

It's Unprecedented: This is the *first ever* US/Canadian International AtariFest. Representatives of both Atari US and Atari Canada will be onhand to show off their products and answer your questions.

It's BIG: The 11,000+ sq. ft. exhibition area will be filled with vendors, dealers and user groups from across the US and Canada.

It's Fun: Meet other users with similar interests and attend informal show get-togethers. If you've never been to an Atari computer show, you owe it to yourself (and your computer) to attend this one.

It's Educational: Seminars on topics such as Hard Drives, Speeding up Your ST, Online Services, BBS Systems, Desktop Publishing, Emulation and more give you in-depth, practical information to help you get more out of your Atari. In other words, the show is not only fun, it's good for you!

It's THE Midwest AtariFest for 1991!

EDITORIAL RAMBLINGS

As you may have seen if you flipped through the magazine before coming to this page, this issue marks our first 8Bit Disk of the Month. We're happy to offer it, but we can only have such a disk as long as there is an interest in it. Please help us support your computer by supporting the Disk of the Month.

You also are sure to have noticed this is the combined April/May issue. The May issue will not appear because we've gotten so behind in our schedule. Instead, we'll be right on target for the June issue. All clubs who've signed up for a year will be extended an issue to compensate. This will also happen to all our subscribers, whether magazine or disk. If you have any questions or comments, please feel free to call or write to us.

The delays are mostly caused by two shows: the London show in January and the upcoming Windsor/Detroit International Atarifest May 4 & 5. Because of the London show, we got the March issue off very late, and the planning for the Windsor/Detroit show has eaten up time we would have devoted to getting the magazine out the door! For those who don't know, we're officers of the Ann Arbor club, one of the two clubs sponsoring the show. The other WAUG, Windsor Atari User Group, is also hosting the show, making it a truly international event.

The show should be less than a week away as you read this, assuming the mail is prompt. We look forward to seeing many of our readers at the show, and you can be sure we'll have a report and photos on it in the July issue. We're looking forward to getting back to a normal schedule once the show is over!

Other shows are happening around the country this summer, and we'll be traveling to the MIST show in Indianapolis, IN in July. This is a one day event and we don't have to plan it, so there should be no delays (cross our fingers!) involved for the magazine.

The summer months are approaching, and that traditionally means people spend more time outdoors and with family than in front of their favorite computer. How that affects AIM is there is usually less club news and usually fewer pages, so you'll most likely see the magazine decrease a little in size.

But, the magazine won't be decreasing in readership! AIM is now being read across the globe, with overseas distribution accounting for as many copies as currently go to our club members! US and Canadian distribution is increasing as well. The two local Ann Arbor bookstore chains have started carrying AIM after a few requests, so if your local B.Daltons or Walden's doesn't carry this publication, just ask nicely a few times!

The participating clubs should have gotten a letter by the time they read this with the revised Declaration of Rights and Responsibilities. The changes were very minor. The letter also explained about sending the monthly lists of members to us in ASCII format. We're hoping to stream-line as much as we can to get the magazine to each of you faster!

From The Reader's Viewpoint

Dear Editors,

The letter from John-Paul (Feb. 91 issue) on his troubles with NeoCept's WordUp was informative and not to be ignored.

I purchased my copy of WordUp version 3 at the Glendale Atari show after hearing a gentleman next to me say, "WordUp is Word Perfect for the Atari!" I had been interested in the program for a long time, had read the glowing reviews and it was "Such a Deal!" Next stop, reality. Read on.

E.Arthur Brown Offers WordUp

What sort of organization NeoCept is/was matters little at this point if you can believe the E. Arthur Brown company offering of WordUp that appears in Brown's latest flyer.

Brown says it is a great word processor at the unbelievable low price of $49.95! But there is a catch. The catch, according to Brown, is "no program support" (assuming there ever was).

I don't know what that says to you, but it indicates to me that NeoCept is history, and any further support for WordUp will depend entirely on the generosity of its authors. The chances of this after death support has not been good, and my experience with NeoCept indicates their attitude is "don't call us; we'll call you!"

As John-Paul warned, *do not buy WordUp!*

As for John-Paul's WordUp files, converting them should be a minor but time-consuming project. Assuming he finally received his copy of Version 3, he can simply load each file and save it as an ASCII doc file, which can then be loaded into his next, and hopefully better, word processor, reformatted and saved in the new format.

So far, I have had no problems *saving* WordUp files in ASCII.

Putting ASCII into WordUp

Importing into WordUp is another matter. I have tried importing under TOS 1.2 and 1.4. ASCII files such as .DOC and .TXT could not be could not be imported under either TOS version. I was able to import a First Word v.1.06 file using the First Word Plus import module under TOS 1.2.

TOS 1.4 closed that door and any attempt to import to WordUp now causes a two bomb crash. The lack of the ability to import, in my view, makes WordUp useless as a word processor regardless of its few good points.

The program does indeed have a lot to offer conceptually. In operation, what works and doesn't work depends on many factors. Desk accessories, TOS version, computer modifications, plug-in accessories and more all play a part in how many WordUp features may function. If you are an experienced ST computer user, you know the drill!

What can be done successfully with WordUp is type a document, use the spell checker and then print the document using the text mode and resident printer fonts.

The thesaurus causes a crash (TOS 1.4), but the spell checker is an absolute marvel. It is fast in the extreme, has a huge dictionary and doesn't gag on plurals and apostrophes.

The spell checker, ASCII export and the faint hope of program fixes from somewhere are the only reasons I continue to use WordUp.

WordFlair Offer

As for trading to WordFlair II, I would advise caution at the risk of having to pay $15 to $20 more for a proven program at a *much* later date. WordFlair II is a relatively new offering and I can't remember having seen a review on it.

I saw the original WordFlair being demonstrated by the reviewer at our user group meeting, and it was a crashing disaster. The review he wrote recommended the program highly, as did the reviews on WordUp. Form your own conclusions.

My suggestion is to give it a little time to find out two things. One is the admittedly remote possibility of fixes for WordUp that might make the program useful coming from either the authors or perhaps some clever users out there. The fixes might find their way into the public domain of the AIM disk of the month.

Number two is to allow time for WordFlair II to acquit itself or fall on its nose. Take my word for it; 'tis far better to read about a disaster like John-Paul's than to be sitting at your desk watching it live!

Sincerely,
Wayne Padgett, SVACE

Right On Target

David Plotkin

Starting with STart

By now, you have heard that STart magazine has gone bimonthly. I have done most of my paid work for STart in the past, and this development leaves me with a sense of foreboding I haven't felt in a long time.

The "official" reason is that the number of advertisers left won't support a monthly magazine (most magazines get the bulk of their funding from advertising, not subscriptions). I suspect also that the not-inconsiderable talents of the STart staff, including Tom Byron, Amy Johnson and Jim Burton are being contributed to Antic Publication's new periodical, PC Home Journal. The first issue looked good, and, as of this writing, the second issue has been finished.

The sense of foreboding dates back to a much earlier time. The first magazine I remember that had significant Atari coverage was called Softside. Each of the computers of that time had its own section in the magazine. As I recall, there were sections for the Apple II, Commodore VIC20 and PET, and some other long-gone machines.

I first ran across Softside in late 1981 and avidly typed in the printed listings. Later, Softside added a disk of the month, with an adventure on each disk. In fact, I learned most of my early programming skills by studying the listing for the programs. I even learned some "other" computer BASICs, and provided some translations to Softside. But then, in late 1983, Softside suddenly disappeared—owing me $1000 for articles they published but didn't pay for. Boy, did that hurt! And, while I don't think STart is in any danger of disappearing, what do I know? I didn't think Softside was in trouble either.

We are, of course, not without other resources. AIM, ST Informer, and the highly respected Current Notes are still available.

Still, it bothers me that the Atari market is no longer supported by a professionally developed, color monthly magazine in the US. This says some things to me about the health of the Atari market. I hope it says some things to Atari as well, but I have my doubts that they are listening.

Not All Is Gloomy

There are some bright spots, and as the second month of 1991 comes to a close, those spots are growing brighter all the time.

The first thing is that Atari seems to be settling on the industry-standard VME bus for new machines, including the Mega STE and TT. The Mega STE is a speeded-up version of the STE (16 MHz microprocessor), that has the stereo sound and better color palette of the STE. But the real star is the TT. This could well be the machine that puts Atari back in the computer business for real.

And, one thing I will predict—if the TT doesn't do the trick, Atari will never recover.

Any way you cut it, the TT is a pretty awesome machine. Put together in a compact case and designed to contain a hard drive, the tangle of wires is kept to a minimum. The new graphics modes, the new monitors, and the 32 MHz speed make this machine something special.

The compatibility with older software is pretty good, and adjustments can be made to the software to make it better—provided the software company is still in business and cares to invest in this market (don't hold your breath for Timeworks to update their products!).

Monitoring Resolutions

Speaking of the monitors, the decision to split monitors into two versions—one for the "normal" modes and one for the extremely high resolution monochrome mode makes really good sense.

A monitor that included both color and the very high resolution would be *very* expensive—and many people don't need both. While I really wish that I didn't have to find room for two *more* monitors, I have to applaud the decision to make the split.

Besides, some smart guy like Jay Craswell will probably figure a way to connect the TT to one of the (expensive) commercial monitors that *can* handle all the resolutions (IBM 8514 compatible monitors may work, but I'm no expert).

The Other Players

Another good thing is the competition that is nipping at Atari's heels. You may have heard that Apple released a "new" line of Macs with lower prices. Now, I'm *not* impressed with Apple's new prices, but they are considerably lower than anything they have charged before.

Another development is the aggressive marketing of PC compatibles based on the 80386SX chip. While this chip is not a full-blown 80386, it is still a powerful chip that can do full multitasking and run Windows 3.0.

With Windows 3.0, you can multitask both Windows applications and regular DOS applications (or most of them anyway, some stuff doesn't get along well with Windows). I grant you that Windows 3.0 is not our beloved ST desktop, but it is pretty close, and that's good enough for the general public.

A full system, with a 65 meg hard drive, super-VGA graphics (320x200, 256 colors, 640x400, 256 colors, 800x600, 16 colors), 3 meg of memory (enough to do multitasking), mouse, and two sizes of floppy drive, mounted in a small case, will run under $1500.

Why is all this good? These more-or-less equivalent machines are putting downward pressure on Atari's prices—and Atari is responding like a smart company by reducing their prices. Thus, Atari machines, while getting an impressive dose of power, are getting easier to buy. I like that—a lot. Power without the Price is becoming a reality once again.

Notes from CeBit

In my last column, I chastised Atari (seems like I'm doing a lot of that lately) for the size and weight of their Stacy "portable." Interesting news coming out of CeBIT (German trade show) is that Atari has announced a true notebook computer that weighs in at one kilogram. I find that kind of hard to believe—one kilogram is 2.4 pounds, and the best that the PC people have been able to do is 4.4 pounds.

Of course I have no details—the weight undoubtedly doesn't include the batteries, and may not include the hard drive or floppy. Still, if Atari can bring a notebook-sized portable that weighs in at less than 6 pounds fully equipped, I'll be first in line to get one. That is, provided they don't do something imbecilic like forget to backlight the screen. We'll just have to see.

Well, looks like I'm out of room this month—so see you again real soon.

Developing the Atari
An Interview with Lexicor's Lee Seiler

Pattie Rayl

AIM: Lee, we've all seen your artwork (on the back of the Jan. 91 and front of Mar. 91 issues of Atari Interface). What got you started in art and drawing?

Lee: When I was a kid I did not do well at all. At some point, the teacher put me in the back of the room, with paper and crayons, and left me to do whatever I wanted.

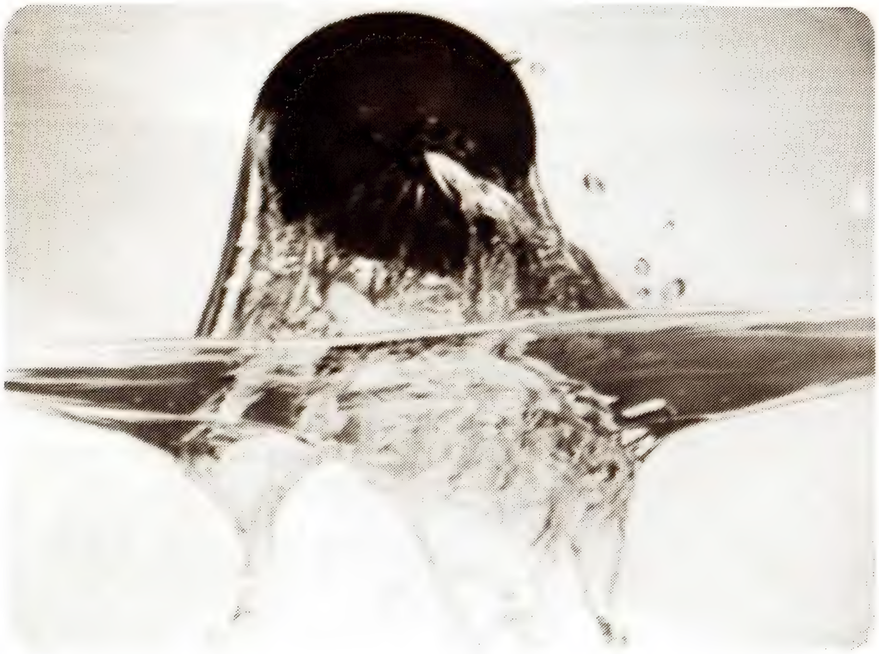
This was at a time in California when there was experimental education...phonetic speling(sic) and the notion that the child should be left to do as he or she pleased.

Needless to say, I failed everything for the next two years and thereafter was always behind.

AIM: What do you enjoy drawing the most? What have you done professionally?

Lee: I like to create animalistic machines best. The relationships between the way humans have copied nature are wonderful. I am always drawn to this kind of creation when left to my own devices.

As far as professional work, my work spans from mechanical illustrations in the Army in the mid '50s to current material on the Atari Computer. Along the way, I have done book and magazine covers, technical manuals, story treatments for a number of motion pictures.



In 1983, I won an EMMY for best technical achievement in a locally produced show...which happened to have a science fiction theme.

AIM: On these book and magazine covers...are these the type of thing we could go into our local bookstore, pick up a book, and say "Hey, Lee Seiler drew this!"?

Lee: Yes, if you can find one. Most are no longer in print, but every now and then I will come across my own work.

Unfortunately, most book covers are sold outright and don't carry an artist credit or copyright. Try finding these credits in current paperback publications. You will find that there is little recognition rewards for the artist. And, in most cases, the artists are contract artists who sign all copyrights away in order to get the work.

AIM: Are there any titles you can tell us for the books you did cover art?

Lee: Yes. Let me see if I can remember some..."Time Riders"... "Orbit"... "Subterrainians"... "The Travelers"... Windsurf magazine, July 1988... Airbrush magazine, Volume 4 No 4.

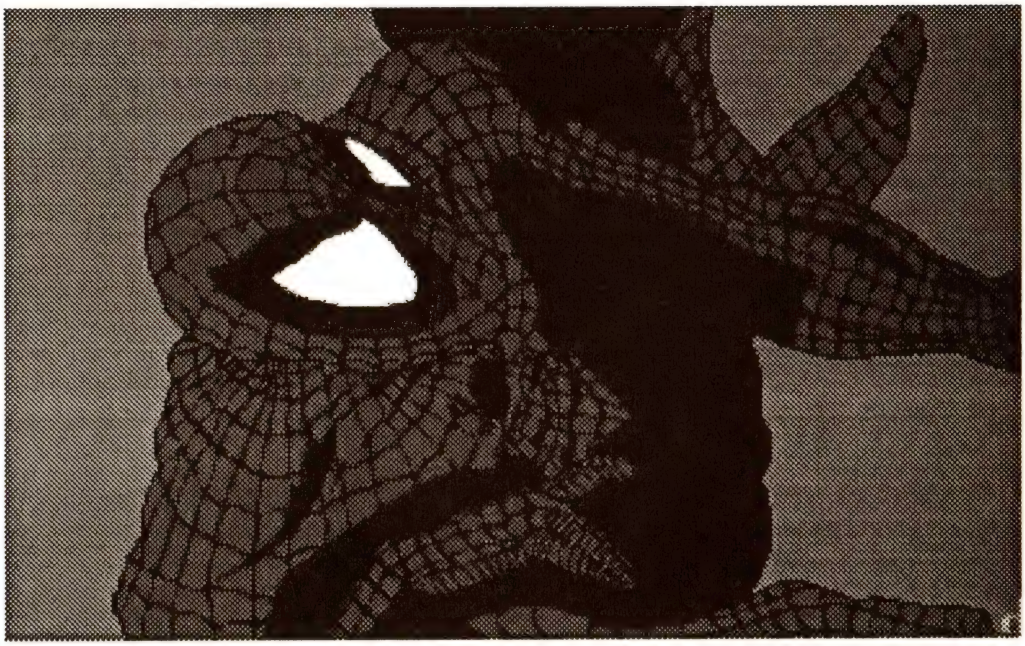
AIM: We have a photo of you drawing a black and white picture of a woman...what is that?

Lee: That is a private commission to do an interpreted fermale version of Captain America. I used several reference books for ideas, colors....

the editor and compiler. But, I had gotten the hacker's manual and lots of developer materials so I could read about it.

I should mention that I had spent 12 years working in the engineering department of the University of California and had a research-level working knowledge of Cobol and Pascal, but only as it applied to our research programming needs.

I soon realized I would not be able to do on my 400 what was then beginning to appear on television as computer art in motion. I was able to do a nice little walking machine game using the alternate graphics symbols for the keyboard as object primitives.



Time passed, and in the fall of 1987, I passed a local Atari shop and thought I would just stop in and see what was going on with the Atari. There I saw Jim Kent's CyberPaint running on a Mega4.

That was all I needed to see. I got the computer and all the Antic software, thinking again that I could start using the computer to do on the monitor what I was currently doing on paper, wood and glass.

AIM: And could you—do on the monitor what you were doing on paper and glass?

Lee: NO! In fact, once I had mastered CyberPaint and the more traditional animation on the Mega4, I dove into CAD3D2 and ran smack dab into CyberControl, et. al....and was very disappointed with the whole idea I had in being able to use my skills and this wonderful computer to make things of impossible creative interest real...I was very disappointed.

AIM: Is that what got you started with your own company?

Lee: Eventually it was, but not at first...

AIM: What got you started with Antic?

Lee: A wrong number, actually, was the turning point. I called Antic for support when I was unable to get the tutorial examples to run in the CyberStudio editor. Instead of the support person, I got Charles Cherry.

Charles was later to move on to Atari in Sunnyvale as head of the developer's division. When I explained my problems to Charles and what I wanted to do, he invited me to become an Antic developer! So, I went from being a total CyberControl code failure to Developer in 20 minutes!!!!

For the next three months I learned the realities of the Atari World, computer graphics and how programs are created. I also met Dave Ramsden, Paul Dana and others who were developers for Antic.

AIM: This arrangement sounded like fun...what made you and Antic part ways?

Lee: It was fun and I learned a lot from Charles and the other developers. What happened was that Charles left Antic to join Atari one Friday...and through the ensuing weeks, it became clear that the assorted projects we were working on would not receive further support by Antic.

Eventually, some of us got together and agreed that, if I could put the financing together, we would form our own corporation in which the developer came first instead of the usual way in which the developer was really just an employee, or nearly so, and got a minimum return for a lot of work.

So, I set Lexicor Software up in such a way that the developer got paid in two ways. First, they get a percentage of the "front door gross" and then stock in the corporation, which meant the developer would share just as the other investors did. Our percentages are, give or take a percent, twice what Antic ever paid and possibily three times what might be expected for off-the-street sale of a program.

We also set up a flexible support system to provide hardware and cash to the developers so they could spend as much time as possible developing instead of worrying about 9-to-5 and developing evenings and weekends.

In this way, I have been able to get all my developers the latest Atari hardware and software tools. I can market their areas and get full and appropriate support from Atari.

We all have each other's best interest at heart, so the usual workplace petty bickering does not interfere with our creative efforts. And, best of all, the developers don't have to worry about getting ripped off by the owners because, in a large measure, they are the owners.

AIM: Who makes up Lexicor Software? You speak of "my developers." Are you the main owner/figurehead?

Lee: First, right now, the developers are Dave Ramsden, Robert Birmingham, Paul Dana and myself. We have several subcontractors who supplement these main developers. Next, I am Vice President and a major stock holder, but I do not own the majority of the stock. The exact make-up of the Board of Directors and the specific role each developer stockholder functions is confidential.

Needless to say, we have offered to ourselves the best of all possible situations and actually are open to supporting more developers. Our problem is that there really are not many developers left in the Atari arena to join us. I should comment that such well known Atari developers such as Jim Kent are involved at several levels with Lexicor, partly because we are approaching the Atari from a professional point of view and partly because, at least in Jim's case, he is my near neighbor here in Marin county.

AIM: Now that we've laid the groundwork for what Lexicor is, can you tell us about what Lexicor makes? I mean, can you finally do on the monitor what you were doing on paper?

Lee: Last first. Yes, I can finally do on the Atari what I wanted to do back in 1979. Just look at our advertisements...they speak for themselves. This brings us to the first part of your question. What we are doing is making it possible for the average Atari owner to have and use a "Real Off Line Graphics Workstation."

This is happening right now...our first major applications are going to printers, being groomed and polished. In the coming months, given the user has the talent, patience and determination, he or she will be able to do the very same work I now do in promoting our software.

There is no doubt that many new and exciting things are coming to the current and future Atari user. Like all good tools, our first releases are just the begining...by way of example I had a late evening meeting with Leonard Tramiel at Atari in which we discussed some new things we both want to bring to the Atari community. Obiviously, I can't be specific for lots of reasons...the most fun reason is that it keeps everyone reading this interview guessing *what's next!*

AIM: Can you tell us if all of your packages depend on each other, or can an Atari owner just pick up one program and work with it alone? How sophisticated is the software, and how sophisticated does the user have to be?

Lee: Good question. There is no required program

Dealer Inquiries Welcomed

package as such. The user can get any of our software and use it right away. We have planned it to function in the same way as other High End systems. You have access to objects, object motion control, post production tools and several levels of finishing tools.

As far as how sophisticated the software is, my developers think it is very powerful and well thought out in design and execution. As far as being hard or easy to use, the user can create anything we have advertised and/or uploaded as sample demos without any programming at all. There is a minimal amount of keyboard use, which is mostly keystroke equivalents and basic file handling...like load and save. The whole idea was to create an environment which did not require elaborate control codes, so there aren't any.

AIM: On the ST, there are several animation programs, each with a different format...will people who've created pictures and animations in other packages have to start from scratch with Lexicor products?

Lee: No. We have used the Cyber series as a foundation as far as format goes. We also support GIF, IFF, Neochrome, Degas/Degas Elite pictures in high, medium and low resolution, and will support PC1 to PC6 files.

In addition, for thoses who are code-oriented, we save Image files, C code, and source code for some graphics formats. This allows the user to create screen images which can be saved and programmed right into software. We have made every attempt to support other platform formats, such as PC P.I.X.A.R RIB files, Amiga Sculpt 3D object files, Mac Sculpt files and several others when we can get them working as we would like.

An example is Turbosilver. We have full support on this, but this may be a format that will be supported as an additional object file by mid-summer or as the demand requires.

AIM: This sounds really exciting! I look forward to the release of your products. I understand part of the delay was due to a hardware dongle produced by Practical Solutions. They're no longer in business—will this hold you back on releasing your products?

Lee: Had to mention that, eh? Well, it was a big problem and to set the record straight, the delays from Practical Solutions cost us a lot in lost time and effort.

Part of their fear may have been that we were not really going to be worth the effort. As it turned out, everything I assured PS came true. Our first commercial orders were far above anything we thought they would be, and now I am stranded with a pocket full of cash and orders and no dongle source. We wish we could find whoever walked off with the goods...we

The **Juggler** $49.95

Working with several applications at once can be a juggling act - and all too often it's an awkward exercise that requires patience and practice just to keep moving! The Juggler has perfected the art of smooth transitions between several applications.

Utilities Plus $59.95

Some of MichTron's most useful programs: *MichTron Utilities* - helps keep control of your Atari ST files, *DOS Shell* - emulates the popular MS-DOS commands used by all IBM compatible computers, *M-Disk Plus* - a RAM disk and printer spooler, *STuff* - a package of 21 different utility programs for all ST users and *Super Directory* - makes filing and organizing your disk files fast and simple.

Hard Drive
Turbo Kit $59.95

In this three-in-one package you will have all the utilities necessary to keep your machine running at its peak speed and efficiency.
- Backup your hard disk to floppy disks.
- Restore your files from the backup after an accident, or anytime.
- Select whether to backup hidden files and/or system files.
- Rewrite your files to contiguous blocks on the hard disk to speed up the time it takes to access files.
- Hold recently accessed disk sectors in your computer's memory, allowing quick and easy re-accessing of these sectors.

were in the process of reordering when PS vanished.

We have made other arrangements so that the US market won't be effected by a hardware snafu this time. We are hoping to fill all CeBIT orders in 15 days with our manufacturers shipping all orders in about the same timeframe.

Of course, I have to add that once we release to the market, we have no direct control of shipping priorities or speed.

AIM: Do you have a date set for release in the US?

Lee: Yes and NO...I discovered that if we were doing direct sales I could give you a date.

I did this last fall when I thought we were ready...we were not, and I take the blame for that one. Now that we are having our products made and sold by a distributor, the best I can do is say we have shipped the masters, manuals and whatever hardware is included (i.e., safekey, graphics tablet, color card (board), Genlock etc.) Then, it is up to them to get their work done in a timely fashion.

How's that for duck and dodge? We think that the end of March is a safe date to shoot for today.

AIM: We wish the best of luck to ya! As a closing question, could you comment on the Atari market and its future? Many developers are considering leaving, if they haven't already...what can you say to those who are still with us?

Lee: That's a complex question, so this may be a bit tenuous for a closing comment. First, from Atari Corporation's point of view the market is just terrific. They are selling every computer they make. Their problem is forcasting what and how many to ship where. Right now, TTs are back ordered in the US to the VAR customers.

From my point of view (i.e., Lexicor), the fewer developers, the better...little or no competition gives me better than two million potential sales. Of course, this is not a healthy situation and is not how it actually is...the current developer who takes software development seriously, follows all the rules and listens to the guidance from Atari, there is and will be a very satisfactory market in the US and the world.

From the point of view of the user, it has been a hard few years for very good reason. There are, and will continue to be, new and more and more powerful tools from Atari...those who leave now will wish they had waited. In just the next few months, the Atari will go from a limited (color and res) computer to being fully equal to and better than any VGA and Super-VGA system, price not withstanding.

No one can guarantee that Atari or those who run it will not fall flat on their faces, but I don't believe from my associations that anyone in authority at Atari wants to fail or is running blind.

As to the future (here is where I get in trouble), I believe—and so do "my" developers—that there is a bright and profitable future for us in the Atari world. We will do everything we can to make it so...if the users and other developers do the same, then how can Atari fail if they just keep making their fine computers?

AIM: On that upbeat note, we'd like to thank you for your time and sharing your insights with our readers!

And Now... It's Hammer Time!

Sledge Hammer
Michigan Atari Group Not Usually Mentioned (MAGNUM)

Sledge Hammer here. Back again after a very disappointing year at Sledge Hammer Hardware & Software. It's years like 1990 that give us our bad attitude recognized world wide. Our three big projects slated for 1990 all ran into major unpredictable problems.

The MagnumMon (our bulletproof monitor) weighed in at just under 4000 pounds. This created two problems.

Most people couldn't carry it home, except for this really big guy who was over seven feet tall, strong as an ox and smelled like one too. The other problem: 37 out of the 50 states required the monitors to be licensed with their Department of Motor Vehicles.

The Hammer Drive (our 160-head floppy drive—one for each track) had an interesting design flaw. All those heads riding along the disk surface made the unit act like a giant Van de Graaff generator. The heads would develop a charge of over 1.21 Gigawatts which randomly discharged into the computer and the user.

The Sledgerator (The Ultimate Accelerator) was very disappointing. We spent a good chunk of 1990 feverishly working to overcome the need to get the building up to 88 MPH. Finally, we had it licked. The Sledgerator worked while standing still.

One night, someone apparently left the Sledgerator turned on in our research and development complex. On the same night, that same stupid person failed to discharge the Hammer Drive. Sometime during the night, the Sledgerator came on-line, the Hammer Drive discharged, and our entire R&D complex was transported to some other time.

Looking Ahead to 1991

Year 1991 looks to be much better for Sledge Hammer H&S. Because of the huge explosive success of our anti-pirating devices, we've been named the exclusive supplier of hardware to the American troops for the 1991 Saudi-Kuwait Military Olympics.

Our infamous reputation has also brought several shareware authors to our door asking us to develop a new method for distributing shareware. They are quite excited about our latest concept—demos that run for ten minutes, then delete the user.

Back in 1990, before R&D disappeared, some of our researchers were working on pyramid power.

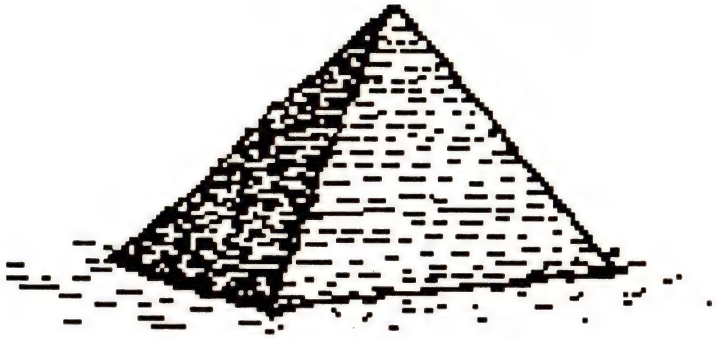
Hearing scattered reports of razors staying sharp, fruit not rotting and even people thinking clearer if kept inside a pyramid-shaped structure, R&D thought they might be able to find a use for pyramid power in our product line.

In addition to pyramids, we also extensively researched a plethora of other shapes. All this has led nowhere. The only concrete fact we've proven to date: Sitting anywhere near Atari's Fuji symbol makes corporate officers completely incapable of making any wise business decisions.

Our *big* product for this year is to be the Super Hammer Hard Drive. The specifications on this baby are impressive. It has an eight-foot diameter, four-inch thick platter that spins at 360,000 RPMs and is driven by a military jet engine.

Storage capacity is astounding. We're not really sure what it tops out at yet. We stopped formatting after we reached a google-byte. The Super Hammer Hard Drive is capable of astronomical data transfer rates.

Just to show off, the guys and gals in R&D digitized a full-length movie—full color picture and stereo sound—from a Laser videodisc onto the hard drive. They can play the movie off the drive in real



time. R&D estimates the transfer rate at well over 800 Megabytes per second.

All has gone well with the project. It's a little slower than I had hoped for, but that's mostly due to OSHA demanding the test unit be housed in its own bunker 300 yards from any inhabited structure.

They've really been on my back lately about how many people we lose in R&D. I don't understand all the fuss. I treat all my people just like union employees, and, so far, we've lost only one person on the Super Hammer Hard Drive project.

I remember that day like it was yesterday. Just the thought brings a smile to my face. I was watching some testing being done on the unit. One researcher noticed a small problem on the control panel. The drive needed some adjustments.

The same dimwit who sent our R&D complex into never-never land headed out to the bunker to work on the Super Hammer Hard Drive. The bonehead attempted to realign the heads while the unit was running at full speed. He caused the most memorable, spectacular head crash anyone has ever seen. Who would have thought six feet of concrete would not stop an eight foot titanium disk? This is what life's all about: major industrial accidents. Without them, there would be no reason to live.

I have to go now. I see the man from OSHA snooping around the bunker rubble. I wonder if he'll find any of my land mines?

Until next time, "Trust us...We know what we're doing."

Font conversion program to convert fonts between Pagestream©, Calamus® and Font Designer©

ANSWERS-TIPS-AND-RELEVANT-INFORMATION

Atari's new AOS for computing on the road

Paul Alhart (AFED)

In the 80s we saw many advances that were not too long ago just visions from the pages of science fiction novels. I sometimes wonder how I made it through high school in the 60s without a calculator. (Does anyone else remember slide-rules?)

Why, we didn't even have microwave ovens to warm up left over pizza back then. "Color" TV was the big news of the day. Do you remember wrist watches with hands on them? I still have one in the drawer, but I'm not sure I know how to read it anymore.

Another item from the science fiction of my youth is the computer. No one was really sure what a computer would look like or what it would be able to do, but that didn't stop the imaginations of the writers or the readers.

Today, computers are everywhere and influence, if not control, almost every aspect of our lives. Still, we are coming up with new uses for them everyday. The majority of homes in the US have at least one personal computer, not to mention all the computer-controlled devices from VCRs to thermostats to make our life easier(?).

Several of the newer cars have their own computers too. These automotive computers control motor functions, breaks, heating and cooling, tell you when a door is ajar, and even run diagnostics on all the car's systems.

What else could you ask for? How about a car that drives itself? Science fiction again? Maybe not. Computer-controlled navigation systems have been hot items for years on prototype "Concept Cars" seen at various car shows around the world. Although these Concept Car systems weren't functional, the dream has always been there.

One of the big hold-backs to this technology has always been the cost. Remember what an Atari 400 system cost back in 1980? Well, now with the vast number of inexpensive (*Power Without The Price*) personal computers available, we are ready to move ahead into the future once more. The latest rumor from Silicon Valley is that our boy Jack is already Beta testing AOS.

AOS or Automotive Operating System was written to run on a standard 64K 800XL. It is supplied on a 4 Meg bank-switched ROM cartridge that plugs into the normal cartridge port. Working hand-in-hand with Ford AeroSpace on the project, a working system has already been installed in a test car.

Not only are the normal engine, climate control, etc. functions supported by AOS, but virtually every function imaginable as well. From the voice-activated door lock/security system to the touch-sensitive dash displays, the trusty little 800XL controls it all.

The best part though, is the Auto Pilot Navigation System. Type in your destination on the dash-mounted membrane keyboard (anywhere in the U.S.) and sit back and enjoy the ride.

Through an elaborate array of infrared and sonar sensors, all driving functions are controlled for you. A constant link to a central Tracking/Mapping Computer (TMC) via satellite and cellular telephone systems ensures you of the best route to your destination. The huge data base of the TMC is constantly being updated with information on road, weather and traffic conditions. This information allows the AOS to program alternate routes "on the fly" as required. You can override the AOS at any time to make side trips or one of those necessary rest stops.

Will we see this fantastic technology soon? You can bet on it. A few "small" problems do have to be ironed out first. Sources close to Jack have told me his first efforts to secure a satellite link were still "up in the air."

Seems that the people that own Comsat, a satellite primarily used for satellite TV, have trouble with the name Atari. Their first response was that they already have their quota of "entertainment channels" allotted.

A couple firmware "bugs" have

shown up as well. Most of the code for AOS was written in Europe. Their machines run on 50Hz AC power, not 60Hz like ours do. This did cause a small problem for the RPM/Velocity sensors on the Beta test car. Two speeding tickets later, this problem was temporarily resolved via the 800XLs keyboard.

A potentially more dangerous problem was noted before the test car even got out of the parking lot. The European programmers, without thinking twice, coded AOS for a car with right side controls. This is great in Europe, but caused US-made cars to turn left when they should have turned right and vice versa. Again, a quick patch via the XLs keyboard allowed Beta testing to progress without too much delay.

To eliminate the need for US drivers to key in these patches every time they start their cars, Atari has promised a "Translator disk" real soon now.

One final problem still exists. It seems the test car was left unattended for a short time and some "curious" kids slipped in and started pressing buttons. The car was last seen heading South on Interstate 5, destination unknown.

A reward is being offered for any information regarding its whereabouts. Be on the look out for a blue 1991 Ford Fiesta with no driver. The test car, code named Atari Programmable Research Interface Link—Ford Operation OverLand, can be positively identified by its initials in large letters on the driver side front door. That's right, it says "APRIL FOOL."

Captive from Mindscape

Paul Gittins (PAC)

After being sentenced to 250 years suspended animation for crimes unmentioned, you are placed in a chamber where the sentence is carried out. When you are awakened, apparently by a computer, you are in a small storage room, but where and when is a total mystery.

As you look around your new surroundings there are signs of destruction which you have slept through. The room is sealed except for a small window through which you can barely see.

Fortunately, there is a tube for intravenous feeding so your survival is assured. Lucky for you. A search of the room reveals a very unusual briefcase which displays holographic images. There is also an instruction manual for the operation of this case.

What you have found is a remote control device which allows you to control four robots. By using the full capabilities of the device, you will be able to explore the planets and moons of your system.

As you figure out the capabilities of the four droids and increase your experience, you will be able to destroy various creatures you encounter.

You don't need to worry about friend or foe. They will all try to kill you in one way or another. Each critter you dispatch will leave you with a small cache of gold pieces which you may trade in at local vendors for repairs, weapons, ammo or various other useful devices.

Your goal is to guide the droids through the planets and dungeon chambers until you find and rescue the Captive...yourself!

There isn't a lot of documentation with this program. The attempt is to be as realistic as possible and to limit the clues. In short, you have to work for what you get. There are plenty of clues, you just have to figure out what they mean.

As you wander through the various dungeons, the game takes on a type of consistency that leads you to know what to expect, to a certain extent. You will find clipboards with passwords which can be used at certain locations. Save these passwords.

The monsters are always a surprise, and they always seem to have just a bit better skill level than you do. You can be sure there are plenty of them, too. Just when you have figured out how to take care of one type, another pops up and there you go again. This is a game where it really pays to save and save often.

The game play is similar to Dungeon Master. It has many different levels of play, and you develop experience points as you wander through the mazes and take out the various little beasties that seem to be waiting around every corner.

As with DM, your skills grow with experience and you become able to use more and better weapons. You also are able to purchase better armor, or should I say body parts. Because you are using droids, you may replace arms, legs, heads or any other body parts as you see fit and the opportunity presents itself.

The only hitch to all this is that you must survive your little "close encounters" with as little damage as possible.

In early gameplay, I found myself getting hurt much too often and using all my gold for repairs of my body parts. Not much money was left for ammo or the other neat little utilities available.

I think the main reason for this is because I am a serious DM fan and have mastered the two-handed playing approach where my left hand works the arrow keys and the right uses the mouse. The Captive interface uses the number keypad instead and the 5 key does nothing. I know it isn't much of a difference, but when you are in a full scale panic, it is enough to cause a minor error which quickly gets you dead.

The game is very challenging and exciting to play. The graphics are excellent. Because of the space type scenario, there is no limit to the many types of monsters you will encounter. Some would have been welcome in DM and many are SF at its best. Like DM, the famous box-step is very productive in dealing with the monsters if you can find a room to do it in. You can also slam doors or walls on the monsters when you find them.

There are very few games I will spend a large amount of time playing. This is one of them. I would guess I have spent about six weeks so far and have finally completed the first mission. I must qualify this because I have full-time work and other obligations as well.

I probably get in about two hours a day, four or five times a week and maybe four hours on Saturday or Sunday. Still, it is a fairly large amount of time. Only Dungeon Master and Chaos Strikes Back have given me similar challenges.

One good measure of a game's popularity and success is in the number of messages posted on the online services. Captive measures up very well. There are many important hints available for the curious or the stumped.

There is no music in this game, although you might think so from some of the messages in the boot screens. There are good sound effects, however, and a sharp ear can pick up several hints. Some of the screams the monsters make will truly curl your hair. This is especially true when you are hit from behind by a scream and then a fireball in short order. All you can think of is "What was that?" and "Where do I run?"

The game comes on two disks. Interestingly enough, Disk 1 is double sided and contains the complete game. If you have single-sided disks, you use both Disks 1 and 2. The game can be saved at any time—and take my word for it, do it!

I found it odd how the save games were done, but they work so I won't complain. You must format your save disk from within the Captive game using their custom disk formatter. This is a very slow process. Once the save disk is formatted you are given choices from 0-9 for your save games. All you need to do is remember which number you last used.

I also like the way the game uses both drives. If the save disk is in Drive 2 and the game is in Drive 1, you can save as you go with little trouble. The only irk I have is that you must either die or kill all your droids in order to restore the save game. Even that isn't as bad as it could be, because the game loads itself into memory and reloads itself from memory after your most previous demise. I'm sure this depends on the amount of memory available, but for me at 2-1/2 megs it is sweet.

I can recommend this game without reservation. I have gotten way more than my money's worth. I understand there are over 65,000 levels of play possible, so even if you can complete one level a day you will be busy for a long time.

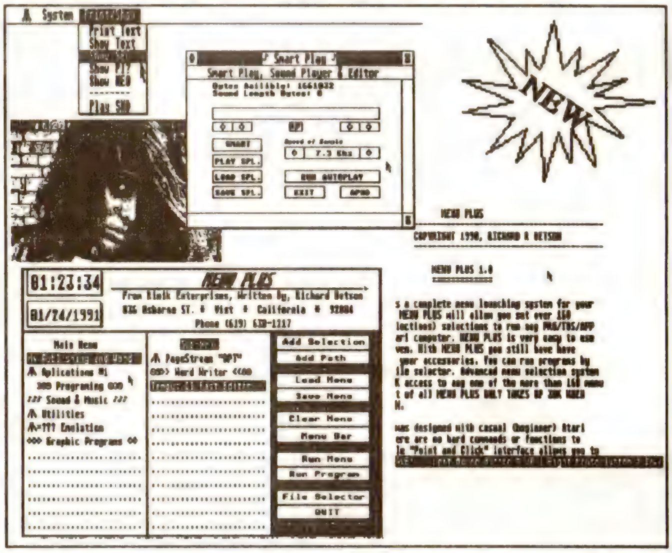
To recoup, it has good graphics, great sounds, it is winnable yet challenging and it can be very exciting to play. Many times I found myself ducking or shifting to one side or another in my seat as we (the droids and I) tried to dodge a lazer or cannon shot. I may even have uttered a phrase or two in exclamation of my excitement or frustration.

This game is sure to be a classic. I have no doubt of this. I am sure that two or three years from now people will still be asking questions about missions or levels or passwords or whatever else is stumping them at the time. Not only that, but where else will you get the chance to kill a Brontosaurus while wandering around looking for the entrance to the next dungeon?

Menu Plus "Program Launcher & More"

Menu Plus

Menu Plus is a full featured "Desk Top" enhancement that allows you to quickly launch (run) any program on your hard drive or floppy disk. Smart menu system allows you to set up programs by category (Main Menu) and sub-category (Sub-Menu). This allows you to highly organize all of your programs. But Menu Plus is much more than a program launcher, just read the features below.



FEATURES

- Smart menu system uses "MENU TREE" that allows great flexibility and speed when launching programs.
- Quick access to over 160 of your programs using only 30k of memory.
- Access to Fileselectors like UIS III.
- View Degas, Spectrum 512 and NEO Pictures. Print and Show TEXT files. The show text feature uses the mouse buttons for scrolling text up and down.
- Launch programs from the fileselector.
- Play and Edit ST-Replay Files. AUTOPLAYER will play all the sound files in a directory. Supports the "SND" file format.
- Set system Colors, Repeat Rate, Check Memory and more....

***** Order now and get an ACCESSORY version of the Sound player , Picture viewer and Show/Print TEXT features all in one accessory for FREE!!**

COD ORDERS add $4.00 S&H, orders outside the US add an additional $2.00. CA. Residents add 7% TAX.

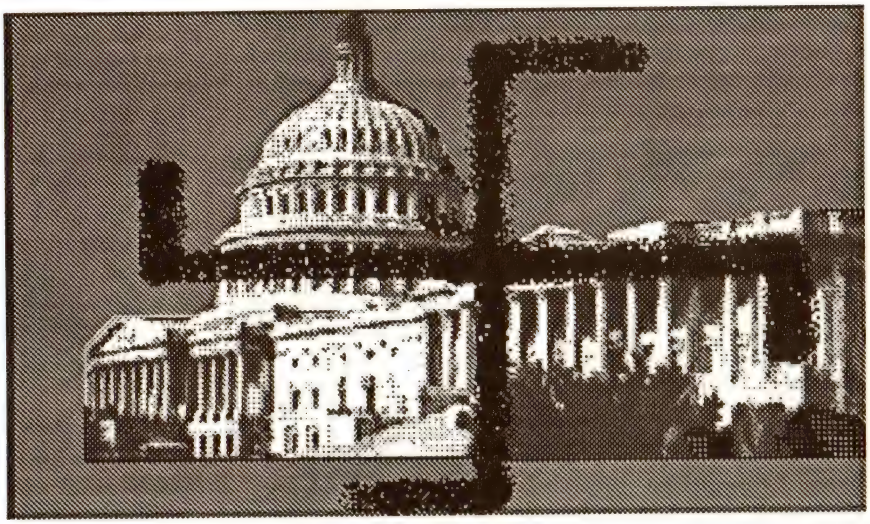
Rocket Ranger
Boot Up and Blast Off!

Gordon Totty (MACE)



Change history! Save mankind! Your children's children's children, and then some, from 100 years in the future have asked for your help and sent you the tools to do the job.

You have been sent a Himmelwurfer Rocket Pack (Model M-2000), a Schmeisser Radium Pistol, a Telefunken Wrist Monitor and a Secret Decoder Wheel. In case you can't figure this junk out, they also sent you a highly secret Gebrauchsanweisung Handbuch. Ja! You vill read closely! You vill not fail! Heil...oops.

Forget that "Heil," I got carried away. Actually, it's Hitler you have to stop. Without your personal intervention, you see, he will win WWII. It is now 1940. You have time left.

Well, what are you waiting for? Move, dammit, or you'll be arrested for treason during this emergency. Yes, treason for inaction, for sitting on your lazy bun bones when there's fighting to be done.

I know, because it happened to me in Rocket Ranger, the cinematic thriller from Cinemaware Corporation. I was hanging around the war room occupying my mind with the grand strategy of moving my minions around the globe to outfox Herr Hitler. We were infiltrating and promoting resistance movements. We were spying and peeking at his secret bases. I had made zero progress, but I needed more time.

Without warning, armed MPs came to get me. They arrested me for taking too long. I had only been at it for a year, for Pete's sake!

Then, I was forced to watch as a huge Nazi flag was draped over the front of the White House. I gagged. I retched. I was powerless. It was all over.

The world was no longer safe for democracy, or something special like that. Your great, great grandchildren would walk like geese. (What a pity! They were such great, great kids.)

Thus ended my first session with Rocket Ranger. Let's back up and separate the imaginary from the real events of the game, so far.

There is a War Room, which is a map of the world. You point and click on countries for status reports, and they are color coded to provide you more information. You have five agents who can be sent to infiltrate any countries you wish, or up to all can be sent to one country (not recommended).

There is a fuel depot screen, where you can note your fuel supplies and transfer fuel to your rocket pack or rocket ship.

There is a rocket lab, where you can watch the assembly of your rocket ship, which will be made from the parts that you can steal from the Nazis.

There is a takeoff screen where you can go to select a destination and blast off to even more colorful screens and plenty of action.

But, most of all, there is a cinematic quality to all of this, with some really good graphics. For example, when Rocket Ranger takes off, you are switched to a screen showing a world map, with a shadow of your caped figure flying through clouds.

On the map, tiny flags or colored pins plot your progress across the face of the world. Now, I ask you, how many old movies does that remind you of?

There's a reason for this, in addition to the fact that this game comes from Cinemaware. (What would you expect? They even label it as an "interactive movie." Of course it has a movie "feel" to it!) Rocket Ranger is based on "King of the Rocketmen," an honest-to-goodness 1949 Saturday matinee serial. Do you remember it?

I don't. I'm the wrong age. My

father told me about Buck Rogers, and I was a fan of Flash Gordon (for obvious reasons, eh?). By 1949 I was too "old" to enjoy Saturday serials, and far short of being mature enough to realize that fun is fun at any age.

If you want to catch up on what you remember, or missed, in addition to looking into this software you might want to see the original. (In an amazing coincidence, while I was writing this review I got an advertisement in the mail for the "Cliffhanger Serials." King of the Rocketmen, starring Tristram Coffin and Mae Clarke, can still be yours if you shop around. Tristram and Mae?)

The documentation for Rocket Ranger provides further background for you history buffs. Now, back to our story!

Gals, please skip this paragraph. Guys, I assure you that when you cast your eyes on the lovely Jane Barnstorff, your "girl friend" and/or former classmate in this game, you will enjoy the really outstanding...graphics. It will make you glad you succeeded in rescuing her and her Dad, Professor Otto Barnstorff, from the Nazi baddies. (I know you gals are reading this paragraph! Unfortunately for you, Otto looks like a slug.)

Rescuing Otto and Jane is one of the several challenges in Rocket Ranger. The fun of it is that even after you rescue them, the Nazi dogs kidnap them again. Like in most action adventures, the challenges just never seem to cease.

PDC, Dept. TCBA, 4320 - 196th SW Ste. B-140, Lynnwood, WA, 98036-6721

Other challenges include air combat with Nazi ME-109 fighter planes, destroying aerial torpedoes, hand-to-hand combat, destroying gunners on the gondola of a zeppelin without hitting the big gas bag, firing a pistol, stealing rocket parts and fuel, finding rocket parts and fuel to steal, and more. Are you tired yet?

One problem with a game like this is that it tries to do so much that it cannot do everything well. For example, do not expect that your dogfights with the ME-109s are going to approach the level of reality, complexity or sophistication afforded by a game or simulation devoted to dogfights. It's just not possible with everything else packed in this package. Nevertheless, I think you'll find the dogfights to be challenging, though you cannot chase the opposition or do any more maneuvering other than decide if you want to be high, low, left or right as they approach you. You should find the perspective amusing.

Similarly, fist fights are not up to the complexity level of some of the martial arts games, though not bad. However, I think we should be forgiving of these possible shortfalls in a game that includes so much diversity.

Some of the scenes in Rocket Ranger approach photographic realism. I particularly enjoyed the Nazi flag on the White House, and a black and white scene shown on the Wrist Computer as Jane was about to be fed into some monstrous machine by the Nazi fiends. Gad, not even her outstanding graphics could save her!

There are other good pictures and scenes, including an interesting dissolve from black and white to color.

Gosh, do you suppose Ted Turner is behind the colorization? For shame, the artistic merit has been undermined. I did not see his name in the extensive credits. As with a movie, credits for stuntmen are included on the disk (but not in the manual). What do you suppose a stuntman is in the programming business? One who turns out a particularly elegant bit of code to solve a problem or eliminate a bug? Actually, I think it is just intended to be a joke here. Watch for it in the credits on your screen.

Some Flaws

Joystick control seemed sluggish to me in parts. I found it hard to beat the aircraft, although the fist fights seemed easy (just keep punching below the belt). To be fair, I am not a very adept joystick jockey anyway. Maybe it's just my reflexes that are sluggish!

The game itself is very slow, with disk swaps (even using two drives) and a seeming lot of disk access. You'll go bonkers if you don't learn to use the ESC key and the joystick button to speed up or eliminate the many slow, non-interactive screens. Most of these are either in the introduction, which is extensive, or are screens of text that you do not need to read over and over as you play the game multiple times.

ESC skips the introduction, a necessary feature because there is no save game feature. Hitting the joystick button is supposed to speed you past the text, but there is no way to stop the text from printing to the screen in the first place. However, this is the price you pay for a game with all the features of Rocket Ranger. The three disks include about a megabyte of code, and I imagine that with a 520ST and one drive it might get a bit bothersome.

I thought Rocket Ranger had a lot of depth, and found it to be a different kind of experience for me. This is the first product from Cinemaware that I have looked at. On the basis of this one, I'd like to try another.

According to the advertising literature packed with the game, Cinemaware has six other titles out for the ST, including Defender of the Crown, King of Chicago and TV Sports: Football. They also market five more ST titles under a Spotlight label. A glance at this literature reveals that this company supports the ST as much as any other computer.

I have not yet completed Rocket Ranger. Sometimes I feel like I might be letting you readers down if I don't finish a game before writing the review. Other times, like now, I feel that enough information is available for a fair, balanced review even though some surprises are left for us to discover later. I haven't experienced the desert or jungle action yet, nor did I make it to the moon. (You can sure get around in Rocket Ranger!) The documentation hints at a secret waiting to be discovered on the moon...the secret behind the Nazi's mysterious leap in technology.

Whatever it is, it couldn't have anything to do with Werner von Braun. He was one of us!

I liked Rocket Ranger. I think you will enjoy it in spite of the flaws noted above. It is better than average, and will provide you with good entertainment.

Finally, I enjoyed the challenge presented in the section of the documentation dealing with backup copies: "Please do not give away backup copies. Rocket Ranger is one of the most ambitious games ever created for the Atari ST. We would love to create even more ambitious products in the future, but will be unable to do so if software theft prevents us from paying our bills. If you support us, we will support you."

Based on my experiences with Rocket Ranger, I'd say that Cinemaware deserves our support.

TEXTPRO Macro Hintss

John McGowan

(This article is Copyright 1991, by John McGowan, but can be reprinted ad libitem provided this notice is included and credit is given to the source from which you received it.)

This article is for users of TextPro version 4.54 or later (referred to throughout this article as TP) and assumes you know the basics of using the program and writing macros for it. If a series of more elementary articles is desired, please pass along requests for such.

This article also assumes you are using an XL with the START and HELP keys. If using an 800, the HELP macro can be accessed with OPTION-? (that is OPTION-SHIFT-/) and the START macro can be accessed with OPTION-# (that is, OPTION-SHIFT-3).

Hint #1:

Always have the START and HELP macros do *something!* For some simple macros that I have written, the START and HELP macros do nothing but print the macro file name on the command line so that I can see which macro I am using.

If your macro requires a certain configuration file, have the START key do a configuration load (SELECT-CTRL-L) of the relevant file, along with any font load commands (for those who do not understand the last comment, version 4.56 of TP allows the loading of new fonts *after* booting TP, while I have written a ML module to allow such later font loads in version 4.54, standard, XE or LOMEM versions).

If your macro is complicated, consider writing HELP screens (24 rows, 40 cols) and having the HELP key do a COPY to E: (or S:) command to display such.

If you have a macro file where either the HELP or START key does nothing, that macro is *not* of professional quality.

Hint #2:

Let every macro put a message on the command line. I have a macro which sets my Star NX10 to underlining...it also puts a message on the command line "UNDERLINE ON" so I know which key I pressed (useful in case you forget the key or press the wrong one).

NOTE: In version 4.56 and later you can put inverse Ps and Ls on the command line, but version 4.54 will interprets these inverse letters to mean use the last file name... NAME.ME if no prior file name is set.

Hint #3:

Consider using "double level macros" to support multiple printers and allow easy editing.

When I first wrote a TP macro to turn on underlining, I defined printer equate keys (INVERSE capital letters) for the printer equates (e.g. INVERSE-A set to 45 and INVERSE-B to 1, INVERSE-C to 0) and had the OPTION-U macro insert (in inverse) 1AB (Inverse-1 being defined, by default, as the escape key). Later, as I became smarter, I also had the macro put a message on the command line to state "UNDERLINE ON".

But still, editing such a file three months later was difficult, for INVERSE-1AB did *not* immediately jump to my mind as "AHA... that is underlining!"

My current macro now puts \U in when I press OPTION-U and \INVERSE-U when I press OPTION-u (and prints "UNDERLINE ON" or "UNDERLINE OFF" on the command line). When I save such a file and load it later I can easily interpret the \U as a command to turn on underlining.

I create my text file (using the macros) and save it, but I *never* print it as it stands, for then \U would print out as "\U" rather than turn on underlining.

Instead, I have a macro, OPTION-CTRL-C to do Conversion. This macro does a GO TO TOP OF FILE (CTRL-H, CTRL-H) and then a GLOBAL search and replace of \U with INVERSE-1AB. Then, it again does a GO TO TOP OF FILE, followed by a GLOBAL search and replace of \INVERSE-U with INVERSE-1AC. The macro continues with CTRL-H, CTRL-H and global search and replace of the other \command macros supported by my macro file to replace the easily edited commands with the proper printer equates.

I *save* the file *before* using the OPTION-CTRL-C command (to preserve the understandable and editable commands), and use the OPTION-CTRL-C command before printing (to convert editable macros to print key equates).

If I get a new printer, all I have to do is change the global search and replace macros in order to be able to print the text on the new printer!

This use of one macro to place editable, understandable code in the text and another to convert to codes for the printer is what I refer to as double level macros.

There are other hints and techniques which I have found useful, and will pass along to those interested.

Remember, TP is the best 40-column word processor around, and its macro capability (much better than PaperClip) gives it its own programmable language.

Support Ronnie Riche and TP...and other 8 bit programmers and users.

Support the 8 bit...if you don't, no one will!

Addendum

In version 4.54, unless you have corrected it, the defaults are *incorrect*. The documentation indicates that the INVERSE-1 key is set to 27. Actually, the INVERSE-0 key is set to 27. All defaults are off by one position.

You *can* redefine these defaults in a configuration file, and should...or else modify the program to correct the errors. I believe the TP456 file has a macro to correct the defaults.

Also, you *cannot* redefine the default equates in version 4.50! If you try to do so, you will find your new definitions in the configuration file, *but* version 4.50 gets its values for the INVERSE-1-6 keys from a different section of the program and ignores the configuration file...so I *strongly* suggest you get version 4.54 or later.

The ATARI XL/XE Commercial Software Drought is OVER !!!

SOFTWARE INFINITY proudly presents its Brand NEW *KE-SOFT Series* -- the First Major ATARI XL/XE Commercial GAME Releases to be produced for the North American market since 1987 !! Eleven spellbinding super-sophisticated 1991 GAMES on 9 economically-priced premium quality Disks ! Already Bestsellers in Europe -- newly enhanced to revitalize your XL/XE !

Every GAME in *SI's KE-SOFT* line boasts ultra-realistic & colorful state of the art high-resolution animated graphics, outstanding music, and lots of clever surprises. Many also feature digitized speech & sound effects, high-score saves, a password system to skip levels, and a capable Editor to near-effortlessly create your own new screens. Handsome and comprehensively detailed printed Instruction Manuals are written in clear, easily understandable English. All 11 superior 64K *KE-SOFT* titles are endlessly entertaining to novice and experienced ATARI GAMErs alike.

$10.50 GAMES
2 or more for $9.50 each !

ZADOR

Turn over all 144 Chinese-symbol tiles on the game board by matching singles to make pairs that are solely connectible by an invisible line (which can't cross any active tiles or be bent more than twice)! A high-powered Mah-Jong variant with 20 levels and useful "prompt next pair" option.

DRAG

Guide intrepid Drag the Frog past deadly mines, exploding bombs, & falling rocks in a treacherous underground lair, to collect diamonds before his air runs out! 50 screens of Boulderdash-type arcade action.

SOGON

Navigate your sturdy forklift around the 50 barrier-filled floors of a skyscraper to relocate large boxes one at a time to waiting storage bays. Once you've moved a box to any perimeter-wall or partition, you can't pull it back! Devious chess-like strategy; vital backup-one-move function.

ZEBU-LAND

Help Zebu engineer the escape of his 3 brothers from a 50-level labyrinthine world of revolving doors and blocked passageways (move wall-segments aside to reveal exits)!

DREDIS

At last -- the unparalleled mind-boggling Commercial ATARI XL/XE version of the arcade champ Tetris! Ultra-challenging puzzle, multiple levels of difficulty, one- and 2 - player modes.

Order 3 or more *KE-SOFT* GAME titles Mixed ($14.50 & $10.50 items together) -- subtract $1.50 from the price of each !

BACKUP COPY of any GAME Disk is $2.00 if purchased at same time as Original; $ 4.00 if ordered later.
Great *KE-SOFT* GAMES *DEMO DISK* with playable sample screens -- FREE with any 2 GAME Disks, or $4.00 separately.

SHIPPING And HANDLING is always just $3.00, regardless of quantity of *KE-SOFT* products ordered.
NO State Sales Tax is due on any SI Disk.

$14.50 GAMES
2 or more for $12.50 each !

TECHNO NINJA

Voyage to a hostile alien world to reclaim your home planet's ultimate source of power! Encounter 10 perilous landscapes (cities, bodies of water, spaceships, etc.) on 100 screens. Gain energy, earn up to 8 extra weapons, battle over 50 varieties of monsters. Enhanced density disk.

CULTIVATION / CHROMATICS

Two brain-busting puzzlers on one disk!
CULTIVATION: Put away your Farmer's Almanac -- this game's about the strategic "cultivation" of matching symbol-blocks; push together like singles in the proper order to make pairs and clear your choice of100 screens on 10 levels.
CHROMATICS: This mesmerizing 3-level Tetris-style contest utilizes 3 - 5 different colors instead of shapes; rotate the hues of blocks falling into a well to place 3 or more same-colored blocks together at the bottom.

OBLITROID

As the last Star Warrior of Xyros, you must track the evil Tindalos to his underground dungeon and engage in mortal combat! Find special weaponry to survive never-before-seen dangers on 4 Worlds comprising 140 screens; invaluable stop/continue mode. Extensive Manual is packed full of maps & tips. Enhanced density disk.

TOBOT / BROS

Two invigorating arcade adventures for the price of one!
TOBOT: Using his versatile laser gun, our robot superhero must escape a spooky 50-room castle filled with angry spiders!
BROS (Super Mario Brothers - inspired): Traverse 8 Worlds with 4 Underworlds each to rescue your brother from a hidden castle -- collect mushrooms to get power or shots, gather coins to earn additional lives, and vanquish legions of monsters!

Presswork's Assistant

Glenn Dulin (COAC)

Are you tired of having your text printouts "run over" the perforations at the bottom of the page or seeing the lines of print "wrap" at the end of the page? Well, Presswork's Assistant might be an answer to your problem.

What It Is

Presswork's Assistant (PA) is a program which lets you exert control over how you print a text file from the desktop. It allows you to control the margins, adjust the spacing, add line or page numbers and generally make an attractive looking printout.

It will also estimate the number of pages a printout will require.

How It Works

The program is fairly easy to use. All you have to do is select the options from the GEM menu with the mouse (including the file to be printed) and let your printer go!

Difficulties

PA does have a couple of problems, though. First, if you are running it on a minimal system (no hard drive, TOS 1.0), it does have a significant flaw in that it is not "smart" enough to be able to keep track of disk swaps.

Second, although largly redundant on such a simple program, the "help" function doesn't (function that is).

Conclusion

While this program works well, it is rather limited in scope. There are a number of other programs that are either shareware or public domain which will do about as much but are considerably cheaper or more versatile.

This reviewer recommends that the author, Chris Sorenson, either add more features or go the shareware route to hold down the distribution costs since as it stands, it is a very poor value.

Some features that might enhance this package include:

- The ability to send setup strings to the printer (for different print sizes)
- Two-column printing (for printing documentation)
- Formatted output
- An integral spooler.

The Funnel MIDI Input Selector from Digital Music Corp.

Dave Thorson (PHAST)

Do you avoid using multiple MIDI devices to their fullest because of the hassle of changing MIDI cable connections? The Funnel might be just what you need!

I have a Casio CZ-101 keyboard/synthesizer and a Roland CM-64 sound module to connect to my ST. I normally play from the CZ-101 to a sequencer program in the ST, and from there to the CM-64 to create the sounds I want. This lets me record my playing, edit and rearrange it, and play it back whenever I want.

But, I find myself using the same sounds in my CZ-101 all the time, and I *never* upload new sounds or adjust the parameters in the CM-64. To do either of these, I need to re-route my MIDI cables. It's not that difficult to do, but I'm basically lazy and I don't like the extra stress placed on the connectors every time I do the MIDI plug shuffle.

Besides, I keep reading that you should never change MIDI cables with the power on, so any set up change also requires a complete cold start of my computer. Not the least bit convenient.

I read about MIDI patch bays, wonderful little devices that let you connect everything to one box. Then, via front panel or MIDI control, you can re-route anything to anything else, change MIDI channel assignments, force keyboard splits and other technological wizardry.

It sounded like what I wanted except for the price—about $400 for a low-end patch bay. A trip to Synthony Music led me to discover a box from J. L. Cooper Electronics called the NEXUS, an "affordable" MIDI patch bay.

This gizmo supports three inputs which can be switched to any of eight outputs. Three-position switches choose the input for each output and prevent you from inadvertently trying to merge two input signals into one. LEDs light up to show which inputs are active, and the whole box is a bit smaller than an SX-212 modem. The price was better, too, hovering about $80 as I recall.

I was all set to buy when a trip to Price Club left me $40 poorer and one Casio DH-100 MIDI Saxophone richer. Now a new dilemma faced me, I couldn't figure out how to wire everything through the NEXUS box without frequent cable changes. The NEXUS would help but wouldn't fully solve my problem.

Back to Synthony for advice. They had a different box from a different company that had *four* inputs and eight outputs, but cost about $35 or $40 more, effectively doubling the price of my MIDI sax.

This new box also took about twice the space of the NEXUS, and might cramp my mouse's grazing patterns even more. I hemmed and hawwed and hemmed some more, until the salesperson remembered another product—The Funnel.

I had visions of something that swirled all my notes together and spit them out a small spout into my ST.Then I saw it. Much smaller than either of the other boxes. Hmmm...*six* inputs on this one. Two of them seemed to be selectable, but the other four were all ganged together. And there was only *one* output! Was this some sort of joke? How could this possibly be the answer to my quest?

As the salesperson explained the concept behind The Funnel it seemed more reasonable. It was developed to help people manage System Exclusive messages between multiple MIDI devices (typically sound modules), the idea being that normally only one of them needs to send data to the computer at any point in time.

Using MIDI thru ports or boxes like the NEXUS, a MIDI signal could be split and sent to several sound modules at once, which would not usually need to send anything back to the computer. When a System Exclusive message is sent to one of the boxes, only that box needs to respond.

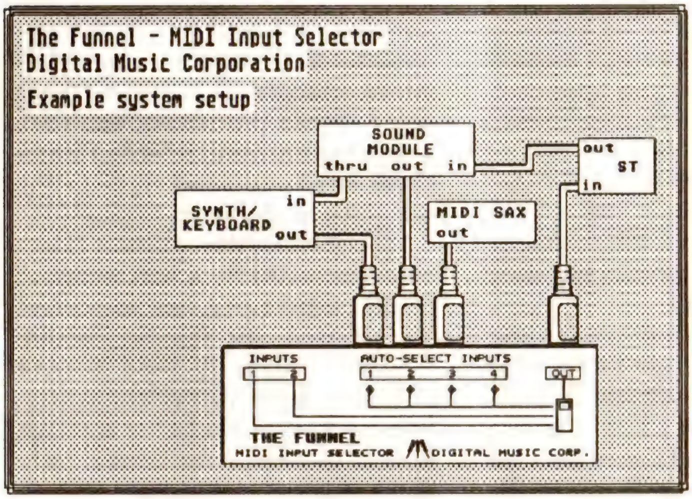
The Funnel contains a very fast-acting circuit that looks for output from any of the sound modules and feeds that signal to the output port and on to the computer. Four of its input ports are automatically selected like this, obviating the need for manual switches like those on the NEXUS box.

Digital Music Corp. also realized that some MIDI devices use a technique called "active sensing," where they send out a message every hundredth of a second or so to be sure something is listening on the other end of the MIDI cable (somehow they can turn off stuck notes when they find they're being ignored).

These pulses would cause that device to be constantly selected by The Funnel, precluding selection of other devices competing for a chance to send output to the computer. The Funnel provides two additional inputs that must be manually selected, one at a time, instead of the automatic selection ports. Devices for which Active Sensing (or other time pulses) cannot be disarmed can be connected to these two inputs.

I stared at The Funnel some more, and described my MIDI requirements again to the salesperson, who explained how I could hook everything together using The Funnel.

The accompanying diagram shows my current setup. I run the outputs from my CZ-101, DH-100 and CM-64 to three of the automatic selection inputs on The Funnel. The Funnel's output goes to the ST's input.



One additional connection is needed, from the CM-64's MIDI Thru port to the input of the CZ-101 (the DH-100 has no MIDI In, so this all works fine).

Now I can play from the computer to either the CM-64 or CZ-101, or both at once, since the ST's MIDI Out goes to the CM-64 directly and is passed unchanged to the CZ-101 via the Thru port of the CM-64. I can play a note on the CZ-101 and The Funnel selects its line for output to the computer and into my sequencer program.

If I play a note on my MIDI sax, the Funnel quickly switches to the sax and sends its signal on to the computer. If I send a system exclusive message to the CM-64, its handshaking signals cause The Funnel to select the CM-64 for output and patches or reverb settings or anything else can be sent to or received from the CM-64. The same is possible with the CZ-101.

The only limitation I've found is that my ST must be turned on if I want a signal to get from the CZ-101 to the CM-64 (or DH-100 to CZ-101 or CM-64), and I've got to have a sequencer or other software running that echoes MIDI through. Not a serious drawback, since when I'm playing with MIDI anything, my ST is running alongside. I've seen no timing problems or mis-fired MIDI messages either—The Funnel works like a dream. I don't need to hit any switches; in fact it's so ignorable I may eventually forget all about The Funnel someday....

The Funnel is also not designed to let two or more inputs be played simultaneously (such as a keyboard and MIDI sax). MIDI merge devices are available elsewhere if you have that requirement (the NEXUS PLUS has two inputs/eight outputs with merging, thin/transpose/split zone capabilities and a battery backed memory. Also, the September 1990 issue of Electronic Musician has a parts list, schematic and detailed instructions for building your own MIDI merger).

Other info: The Funnel has LEDs that light to show which input is selected for output (useful in debugging devices and cables to be sure they're sending MIDI data, and they seem to fascinate visitors for some reason). It draws its power from some MIDI cable somewhere, probably the ST's input port. No batteries, power adaptors or extra AC cords for my already crowded power strip farm.

The box has only one control, a three-position slide switch to select manually between input 1, input 2 or the group of four automatic selection inputs. The Funnel is about six inches long, two inches deep and one-and-one-quarter inches high; a black box with blue and white lettering.

Unobtrusive and almost attractive, definitely hi-tech. The Funnel comes with a *Five Year* warranty.

The manual is almost a joke, only four pages long (and small 4"x5" pages at that). Two of those pages are reserved for the front cover and back cover warranty description. This is no problem, though, since this little gem is so easy to use. It handled my setup needs almost perfectly and I've still got room for further expansion (maybe a MIDI-synchronized multitrack cassette deck? Dream On!).

In spite of all its amazing qualities, The Funnel can be purchased for around $70, a lower price than any of the alternative devices I considered (I also looked into building my own simple patch bay, but after buying a slew of 5-pin connectors and switches, a case and some opto-isolators, I would have spent close to that amount).

Check out the diagram of The Funnel and you should be able to tell if it will help you get more out of your MIDI gear. It can be used as a "MIDI Control Center" as in my setup, or to add extra MIDI inputs to other patch bays. I highly recommend it!

Tax Spreadsheet for the Atari 8-bit

Alan Frazer (Pinellas ACE)

Since I do my own taxes each year, I'm always searching for an easier way to do them. I recently bought a package for the IBM and figured I'd just go in Saturday to work and use one of those machines.

However, while looking at the ads in STart/Antic Magazine, I came across an ad for Tax Spreadsheet. I sent a check for $22.95 on Tuesday, and by the following Monday I received the Tax Spreadsheet in the mail.

The package was not glossy, but adequate. The instructions are clear and comprehensive.

The program is in three parts. The main program is chosen from a menu as "1040." The other programs are "CONSISTENT" and "PRINT." Consistent checks for errors across all of the forms, and Print prints the values on a 1040 form, while all other forms are printed directly.

Running the program is very easy, with all available forms chosen from a menu. Forms 1040, 1040A, 2106 and 2441 are supported, with additional schedules A through F and SE, as well. All of the forms are integrated, so that as one is filled out the values are carried over into corresponding forms.

Cursor control is very easy, with a "B" entered to backup one line, "R" redrawing the form with the current line at the top and "Q" allowing you to quit the form.

The program has a built-in calculator: if a value is entered with a "+" or a "-" behind it, the value will be added or subtracted from the line total as indicated. Hitting <Return> on the final value fills in the total.

As forms are completed, you have the option of saving them or continuing on with the other forms. The documentation recommends filling out Schedule B first, then the front of Form 1040, then Schedule A, and then the back of Form 1040. That way, the program doesn't give you a bunch of errors while it looks for data.

After I finished, I ran the Consistent program, and got errors at the tax calculation. However, on rechecking everything and looking up the tax in the tables, everything was okay. I presume the problem was using SpartaDOS, although the author indicated that the program is compatible with "most DOSes."

After I reviewed the forms, I ran the Print program. The results were excellent, although you may have to experiment to line up the forms. The documentation recommends using lined (green bar) paper if you submit the printed forms to the IRS.

There were a couple of drawbacks with the program. While the "calculator" is nice, a "notepad" would be better for listing interest on Schedule A. This is typed in on the Print program as it runs, but would be nice to have as you input the data on the form itself.

It was necessary to continue to refer to my notes or receipts as I worked, rather than typing it onto the screen. This was a feature of the Tax Advantage program.

Tax Advantage also had a "what if" option; you could input a hypothetical situation and see how it affected your taxes without changing the final form until you told it to.

Although the Tax Spreadsheet program is in BASIC, there are a number of USR calls that make modification difficult.

One of the best things about the program was its lack of copy protection. However, the program is *copyrighted.* To obtain a copy see the address below. I certainly intend to support Steve Karasek, the author, next year if he comes out with an update.

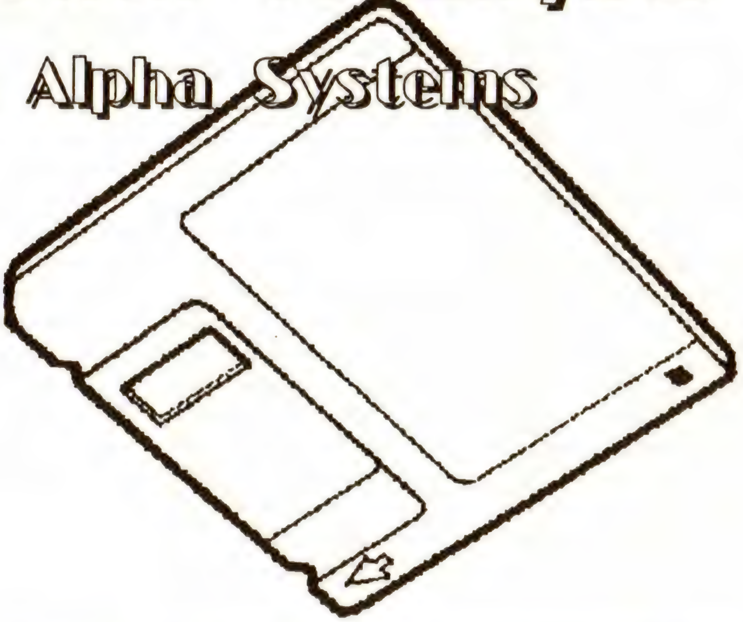
ST Protection Techniques
from Alpha Systems



Bob Retelle (MACE)

This book is something of a puzzlement. Just as you think you've figured out what it's all about, it changes directions on you and leaves you wondering just what it's trying to tell you.

It's About Piracy

The ads for the book talk about advanced disk copy protection methods, and tell you that it will "guide you through the methods used to create the protection as well as the copying techniques to get around them." Aha! It's a book that will tell you how to crack copy protection and let you pirate all the latest games!

It's Against Piracy

Well, no...not exactly. The first section of the book tells you everything you ever wanted to know about software pirates. It tells you who they are, how they get the programs they steal, and how they trade their "warez" with other pirates. Then it tells about the financial damage done to software publishers, and society as a whole. Oh...then it's an anti-piracy book.

No, not that exactly either. It quotes pirates and gives their motivations for stealing software and their justification for their actions. Software is priced too high, and besides, copy protection denies legitimate purchasers their right to make backups of the programs.

Then suddenly, right in the middle of talking about electronic distribution of pirated software, the book makes a left turn and gets into a discussion of "black boxes" to steal telephone services, complete with instructions on how to make one of your own. (However, they do tell you: "WARNING - The phone company can randomly check for black boxes. Persons caught using these devicess may be subject to criminal prosecution.")

Blue boxes, red boxes, even purple and beige boxes, they're all discussed. However, while the book tells you all the wonderful things these boxes do for a phone phreak, it doesn't give details on anything but the simple "black box."

And there's the rub...and the problem with the book. Many things are hinted at and described in general terms, but there's very little detailed information to put anything into practice (assuming you'd want to).

It's About "Crackers?"

Anyway, back to the book. After telling how the phone companies are making things tough for phreakers, it shifts to a discussion of "crackers" (a sub-species of hackers who like to break into other people's computers), and then goes into pirate bulletin board systems.

Finally the section ends with a discussion of problems facing pirates (and would-be pirates), including the fact that most pirates distrust other pirates.

And Now Protection!

At last, section two gets into the actual disks. After a brief treatment of the layout of a standard disk, the book covers copy protection methods, beginning with the most simple, and working up to more sophisticated techniques. The information in this section is interesting, but again it really doesn't tell you enough for the average person to be able to do anything with the material.

The next chapter goes into protecting online computer systems like private BBSes from hackers, followed by a chapter that talks about Viruses, Worms and Logic Bombs. This latter chapter tells how some viruses work, and some steps you can take to protect your system against them.

Suddenly the book shifts once more from hinting at how pirates get around copy protection to the laws available to protect software from pirates. It tells you what legal protections are available, and even tells where to write to register your program's copyright. Then it goes on to discuss Freeware and Shareware as ways to distribute a program.

This section ends with a "look ahead" to see what lies in the future of the software publisher vs. software pirate wars and finishes on a (relatively) anti-pirate note. Section three consists of reviews of products that can be used to defeat copy protection, including the Discovery Cartridge, ProCopy, and Switch/Back.

And Now About the Disk

The last section of the book is documentation for the program that comes on the disk included in the package. "The Protector" is a program designed to allow you to apply "sophisticated software protection schemes" to software of your own. This will protect your disks from "unauthorized use, copying or tampering." Unfortunately, the previous section just got done telling you about products which will copy anything, regardless of what protection methods are attempted, so I wouldn't bet the farm on making any disks uncopyable.

The program is of more use in keeping others from reading or disassembling your text files and programs, and allows you to make "demo disks" of programs by limiting the number of times a disk can be run.

You can apply password protection to files, which will prevent anyone not knowing the password from using the files. The book warns several times to make backups of the disks before the encryption is done, as Alpha Systems will not release any details of the system used to encrypt the data, and will not unprotect any disks if you forget the password.

The "Limited Use" option of the Protector program will let you specify how many times the disk can be used, up to 99 times, and then to decide what action should be taken when that number is reached. You can simply have the computer display a message then lock up, or it can erase the file or even reformat the entire disk. This feature could be of value if you'd like to create demo disks or enforce a Shareware license.

The last option of the Protector is much more technical and interesting if you'd like more information on how disk formats work. It allows you to create custom formats and put errors onto a disk which could help prevent some copying attempts.

The disk also includes a set of C language calls you could include in your own programs to allow direct manipulation of the floppy disk controller. With these functions, you could include a measure of copy protection directly in your own programs.

Finally, the book ends with an appendix giving techincal information on the standard ST disk format, with descriptions of what all the bytes in the boot sector and directories are used for. This one section contains more hard information than the rest of the book combined.

Final Thoughts

So, what *is* this book all about? Well, it's definately not a "how-to" book telling how to crack copy protection. It's also definately not a handbook telling how to protect your programs from pirates. While reading through the book, I got the feeling that it was sort of a "Sunday Supplement" kind of treatment of the subject of copy protection/piracy. An overview, some interesting anecdotes, but not much in the way of hard information.

ST Protection Techniques could make interesting reading if you've always wondered what all the talk of software piracy was about, and you have no intention of rushing right out and cracking the latest games, or starting your own software publishing company complete with copy protection schemes.

Available from Alpha Systems, 1012 Skyland Drive, Macedonia, OH 44056 for $24.95 including the disk. Alpha also has a second book, *Advanced Protection,* which may go into more detail than this one did.

AIM
ST Disk of the Month

All files on this disk are self-extracting LZH archives created with Double Click's Self-Extracting ARC program DC SEA! To use these programs, simply double click the files. Then, click on Extract and select the drive/folder to which you want the extracted files saved. Click on Verbose to get a list of the files in each archive or Exit to abort.

Here's a short description of the files on the April '91 disk. For more complete docs, see the text files contained in most of these archives.

ABBREVTR.APP—Abbreviator ST allows you to type an abbreviation that will expand automatically...great for word processing or telecommunications. Demo version limited to 9 abbreviations loaded at one time.

ARCSHL23.APP—Version 2.3 of ARC Shell, now fully compatible with the Atari TT030 computer and ISAC hi-res color board. Also allows access to the 'Include Subdirectories' functions of LHARC. SHAREWARE! Copyright 1991 Charles F. Johnson and Little Green Footballs Software.

BARDSTE.APP—Allows you to play Bard's Tale from RAMdisk and allows the game to run on the STE!

BINGO.APP—Traditional Bingo game. Try to pick the winning card for each game. Color only.

BOOKER.APP—Printer utility for HP Laserjet/Deskjet that prints ASCII files four to a page in booklet format. Turn those README files into manuals!

DCCRC.APP—Another useful utility from Double Click Software! DC CRC computes a file's CRC and saves it to disk. Later, you can check against the saved CRC to determine if the file has been corrupted. This is also a good way to protect from "link viruses."

DCDIRDMP.APP—DC Directory Dump lets you print any directory's contents to the screen, printer or a file. Another freeware release from Double Click Software!

DCFLPCFG.APP—DC Floppy Configurator lets you logically add or remove floppy drives from your system, as well as set the step rate (on any system). Another Double Click Software freeware release!

DC_FKEYS.APP—DC Function Keys lets you assign 49 function keys text macros of 40 characters each. A "text" data file is used for easy user editing. User assignable on/off keypress built-in. Another freeware release from Double Click Software.

D_VIEWER.APP—A text viewer that follows mouse movement to scroll through a file. Four different speed settings. Shareware from the authors of D_Term and Cheetah.

GER2ENG.APP—An easy to use program that converts German text to English! Seems to average around 45-55% success ratio...not perfect, but it makes most DOC files readable.

MIDITALK.APP—Lets you talk to any MIDI synthesizer via the ST keyboard, making data dumps a breeze.

MIDIMAZE.APP—MIDI Maze II from Germany! This shareware program is all the commercial game was and lots more! Program is in English, but docs are in German. Use GER2ENG to make sense out of 'em!

NOROACH.APP—NOROACH allows you to set the length of time TOS will wait before trying to boot from hard disk on a Mega STE or TT. For ST, Mega and STE owners, it also has the useful side effect of guarding against floppy disk viruses. Also lets you load a custom icon to display at startup. Several icons are included, many of which can be used in your DESKICON.RSC file if you have a Mega-STE or TT and know how to use the Resource Construction Set. From Atari Corp.

SNAP_IT.APP—Snapit is a DEGAS screen snapshot program that can be turned ON or OFF without rebooting. Works in all resolutions.

VIEWGIF2.APP—ViewGif 1.2 allows your ST to show GIF, IFF, LBM, MAC, CP8, NEO and Degas pictures; create GIF, MAC, NEO and Degas; translate GIF to SPU, IM (AIM) and CP8 formats; GEM-based; works in all three resolutions. SHAREWARE.

VOICESEL.APP—Desk accessory that lets you send program change requests from the ST to any MIDI synthesizer. Very useful when using a sequencer.

WORDBID.APP—Here is a FUN and educational game. Bid on letters as the word platform decends closer to its doom. Graphics, sound, color. This is a LOW rez demo of the game.

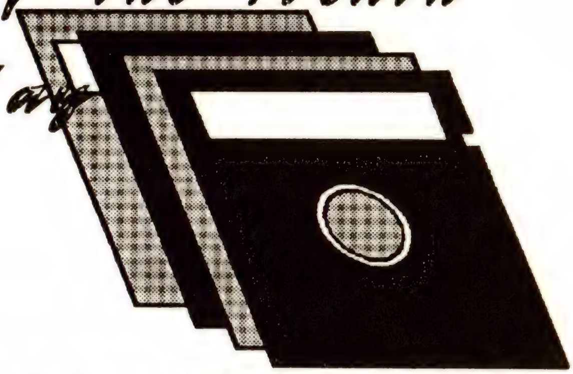
ZEST.APP—Nice program that simulates the look of the NeXT desktop in GFA. Source code included. Includes a calendar, database (address book), typewriter and paint program. Use the ZeST interface for your own GFA program! Mono only.

Readers can purchase this disk from their local AIM Participating user group or by sending $6 ($5 + $1 S/H) to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. Please specify the April '91 ST disk when ordering.

AIM 8Bit Disk of the Month

April/May

1991



Each AIM 8Bit Disk of the Month is a single-sided, single density "Flippy" packed with ARCed software. To extract .ARC files, use UNARC.COM on Side 1.

Here's a short description of the files on the April '91 disk. For more complete docs, see the text files contained in most of these archives.

Side 1 of the April 1991 AIM 8-bit Disk of the Month contains:

UNARC.COM—SuperUnARC by Bob Puff. Use this program to extract files from the .ARC files on this disk. This utility is NOT ARCed.

CABLEBRD.ARC—BASIC program that gives you a cable TV message board or advertising board for public display. UNARC to a disk and reboot without BASIC/Cartridge loaded. Program will autorun.

EBS.ARC—For cable TV, this BASIC program runs a test of the Emergency Broadcast System.

GRASSCAL.ARC—Full-featured calculator written in BASIC by the GRASS user group of Grand Rapids, MI.

TPFNTLOD.ARC—Programs/utils for loading fonts for TextPro wordprocessor. Accompanies John McGowan's article in the April '91 issue of AIM.

LM16.ARC—Shareware Label maker/printer from Black Moon Systems.

SIO.ARC—Software Inventory Organizer, a pretty good disk cataloguer. An oldie, but a goodie.

AROP.ARC—Pacman game from Jon Snyder. From DOS, use 'L' to load, then press 'M' to run at memory location 7800. Press START to play.

Side 2 of the AIM April '91 disk contains:

DISKCOM3.UTL—Bob Puff's program to crunch an entire disk into one file. This utility is NOT ARCed, for your convenience.

CYBORG.ARC—Demo of Cyborg Warrior from Marcel Programming. Note: May be necessary on some systems to "Run at address" 2000 after loading this game.

SARC24.ARC—Complete SuperARC and UNARC programs with full documentation. Shareware from Bob Puff.

SYNTRON2.ARC—Shoot-em-up space arcade game from Jon Snyder. How long can you last against the hordes of aliens?

DEGASRD1.ARC—Load and view Atari ST pictures created with DEGAS. Sample picture enclosed. Great graphics utility from J.D. Potter.

Readers can purchase this disk from their local AIM participating user group or by sending $6 ($5 + $1 s/h) to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108.

Please specify the April '91 8Bit disk when ordering.

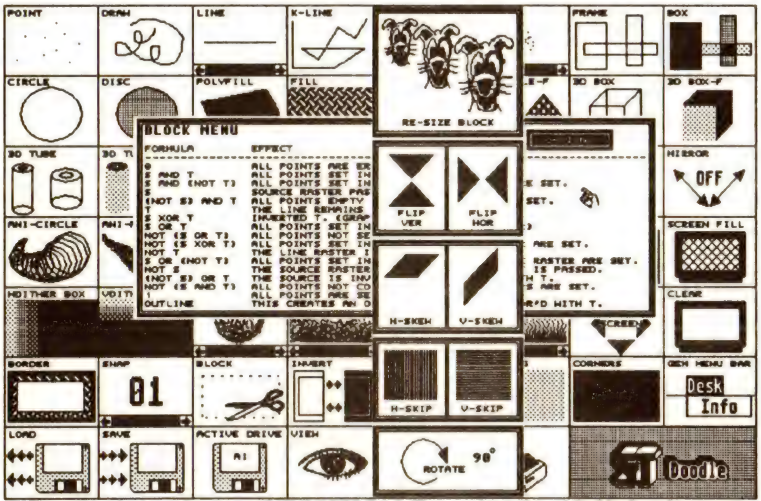
NEW LOGO
NEW ADDRESS
NEW HOURS
1:00-9:00PM Central
Monday-Friday

We designed ST DOODLE 1.0 to offer a powerful bit mapped graphics editor but at a price everyone could afford. ST DOODLE has an interactive interface that makes it easy for anyone interested in graphics to start getting results the first time using it. Early testing showed that even younger ST users could easily understand the graphic point and click interface. No need for pull down menus or text commands. Every function available is highlighted with a graphic depiction. Don't let the low price fool you, ST DOODLE has over 45 different features including some never before seen in a paint program. You get standard features like CIRCLE,BOX,RAYS,SPRAY,LINE,FILL,ect. but we designed new features like TRIANGLE,3D BOX,3D TUBE,BOX-CIRCLE DRAW,SMEAR,GRADIENT SHAPES,DITHERED BOXES. You even get advanced but easy to use features like GRID , CURVE, BORDER, ANI-CIRCLE, ANI-BOX, SCREEN FILL,CYCLE DRAW(wild!). Then there's our extensive block menu where you get over 16 different block modes including **OUTLINE!** You get access to a free scrolling 640/800 screen. This gives you a full page of editing available. Right now if we stopped, the $14.95 price might already sound good. But we knew to offer a really good value it needed a little more. So we talked the programmer into adding an extensive printing section which lets the user print out the current screen or complete page upto 14FEET wide by 9FEET tall! You can drag the image to any dimension you like. The printing feature alone would justify the asking price. All the above features are available from within the program after the program loads once! No disk swapping, multi loading. ST DOODLE is available only through MUNSIE MARKETING. Dealer inquiries welcome. Requires 1meg, 720k drive, mono monitor,Epson compatible printer. **$14.95**



Shown here is the main screen of ST DOODLE 1.0. The user has selected the block options menu.

Now here's something different. How would you like to design an interactive video presentation where the viewer could choose which path the presentation is going to take? Imagine the possibilities. Store owners could create the ultimate interactive catalog. This program has excellent educational potential. Example: The viewer is first shown a screen of the alphabet. The viewer could then click on different letters to bring up pictures that relate to the chosen letter. Get the idea? How about designing a local map of your area? Simply show a overall picture of your town. Then let the user click the mouse on selected areas to bring up close ups of that area, each with different areas to view. The viewer could click back to the main screen or travel even deeper into the area. How about a tour of the human body? Just display a picture of the human body and let the user click his way through his own FANTASTIC VOYAGE! Theres never a need for a dead end because each screen can be related to other screens. You can even create video adventure games! We knew we had something neat here so we added support for graphic blocks, block moves, block animations, sound FX, text boxes, AUTORUN, PICWALK files can even be set to run by themselves. This program works on all 3 ST resolutions but requires 1 meg of memory to run. This is a SHAREWARE release only. If you cannot find it locally you can order it from us for only $1.00. If you decide to use the program we would appreciate a small donation. This would entitle you to receive our typeset manual and program updates. Support shareware efforts you USE!

Now during the weekend you can call our customer service line to hear our recorded **tele-catalog** which informs you about our latest products and specials. Get informed on the weekend, call 817-498-3951.

Do you want to know more about...

GFA BASIC?

If you answer yes then you need our GFA SURVIVOR KIT! We stuffed 6 disks full of code and help files relating to almost every topic of programming in this outstanding language. Find out how to do smooth scrolling without learning machine language. Arcade game programming, tricks, GEM window management, music & sound effects. We also include our own typeset manual which includes important text files and code ready for you to readup on. Find out how to do the things YOU want to do! To start getting more out of GFA BASIC order GFA SURVIVOR KIT. only **$11.95**

SUPRA 44 meg Removable	**679.95**

"I'd like to take this space to say thank you to all of our customers over the past few months. And why not add a fine print special? Okay..Hmmm... I know, buy a 1040STE from me and for an extra $15.00 I'll throw in a copy of Word Writer ST and a mouse pad. More? Okay how about a pack of 10 disks? More? Sorry the buck stops there. But hey, I did my part. This offer is valid during APRIL only. User group of the month? STar of Belleville, Illinois. Why? They have extreme patience! They put up with me while I had to put up with UPS. Hope to talk to ya soon." - Dave Munsie

To order any advertised items please send a check or money order. We do not take credit card orders. We have a growing list of ST Shareware for only $1.00 per disk. Please write or phone to receive our latest mailings. Shipping is $3.95 per order. Add $6.95 per computer or monitor. C.O.D. orders add $3.75.

AAAUA ATARI 8-BIT USER GROUP

Alamo Area Atari User Association (AAAUA), P.O. Box 79-1426, San Antonio, TX 78279-1426

The Alamo Area Atari User Association (AAAUA) is an Atari 8-bit user group serving primarily the greater San Antonio area. General Membership meetings are held on the first Tuesday of each month at the Balcones Heights Community Center, 107 Glenarm, San Antonio, Texas, from 6:30 to 9:30 PM. General meetings feature a presentation of general interest and small group problem solving. Each third meeting we have a swap meet and computer workshop in lieu of the informal presentation. AAAUA maintains a Public Domain Library of about 700 disk titles as well as a sizable hard copy library of magazines and newsletters. Each month we publish (FR)ANTIC, our user group newsletter, covering happenings of local interest as well as other topics, both technical and non-technical.

Members also receive a subscription to AIM Magazine as part of their member benefits. Dues for Regular family membership are $24 per year or $15 for six months. Dues for Subscribing membership are $15 per year domestic and $18 per year for most foreign countries. For further information write AAAUA at the above address or call Al Sherrill, President, at (512) 492-6633, or Thelma Sunvison, Executive Assistant, at (512) 344-3522.

Presidential Ponderings

The Atari 8-bit computer, or more specifically, the 800, 800XL and 130XE, is probably the best computer buy available today for many home users, especially those with limited funds. Granted, these computers currently are not being produced, and generally are advertised only on the used market. So, why are they the best computer buy today for many people? Because the prevailing "wisdom" is that they are only game machines with archaic games and no good as a computer. Add this to the advertising pressure to have the very latest in computer technology and you have literally thousands of people selling, or otherwise disposing of, their 8-bits. It's an economic fact that when this happens, the monetary value of the computer plummets. Of course, the real value is unaffected. This is bad news for the seller, but a golden opportunity for the wise buyer who is able to withstand social pressure and think for himself.

That is why you can get a perfectly good computer with disk drive today, that will do everything most people are likely to want to do, for under $150, and perhaps much lower. Moreover, this is a CLASSIC computer and a piece of our technological history. Of course, you have to do a little searching to do this;you just can't walk in to a Toys R Us or Sears, and certainly not the average computer store, and expect to get one of these bargains. But, those who are willing to put forth the effort to find them will be justly rewarded. Those of you who already own an Atari 8-bit, try not to smirk. Just feel justifiably proud and support your local user group.

But, "There's no new software for the 8-bit!" You'll hear people complain. Well, that's ALMOST true. Actually, some IS being written, but not much. On the other hand, how many word processors, data bases, or spreadsheets does one need? How many drawing or music programs can you use? How many games can you play? There are still many excellent commercial programs around;just look at the advertisements in this issue of AIM and other selected publications. But, if you don't want to pay the generally reduced prices, there are many good public domain (PD) programs available that are virtually free. How does one acquire PD programs? The easiest and most enjoyable way is to join and support your local user group. Most user groups have large PD libraries with a wide variety of programs available to members. By joining a user group, you will be doing be doing yourself a great favor and you will be helping other 8-bit owners. In numbers there is strength.

If you don't have a user group near you, I invite you to join AAAUA as a subscribing member. See above for rates and benefits. As a subscribing member, you will have access to our public domain library by mail for only $1 per disk in the United States and slightly higher for foreign addresses to cover costs. Programs are also available by modem with special arrangements.

So, how about it, those of you who have difficulty getting support? Join a user group near you or join AAAUA as a subscribing member. Send your dues to the above address; or write or call for further information. Also, tell your friends about user groups and the best buy in computerland! Isn't the tremendous bargain worth the extra effort?

Presidential Ponderings

Have you ever thought about the changing nature of the user group? The average user group today is a far cry from the average user group of ten years ago. In the early 1980's, the 8-bit computer was at the "leading edge" of computer technology. It was the best available for the home user at a price that was not out of reach for many people. Having said that, I need to remind you that the Atari 800 initially sold for around $1200, and, if you could afford a disk drive, that was another $600 or so. Not cheap, but many dipped into their savings to get this technological wonder. In addition, not too much was known about how these machines worked. Even the authors of the many books that later flooded the market needed to do much of their own research. Users did the logical thing; they gathered together in groups to share their computer knowledge.

These intial groups were composed in large part of the young experimenter, the hobbyist, the "hacker", if you will. Most were loosely organized and consisted of "users" getting together to share what they had learned. From these groups, many of todays programmers and developers emerged. Unfortunately, many of the groups had, as their primary objective, the proliferation of pirated software. Happily, much of this has changed. Over the ensuing years, through attrition of old users and the acquisition of new, the membership matured and became more responsible. Rather than being composed mostly of young folks, user groups began to encompass all ages with varying interests that range from only wanting to know how to use a word processor, to programming and hardware modification.

Where are user groups going from here? There are those who say they have outlived their usefulness. They cite bulletin boards, books and magazines as filling this gap. I, for one, do not believe this. I believe there is every bit as much need for user groups today as ten years ago, perhaps more. More people are accepting the presence of computers in their daily lives and want to learn about them. We in the user groups much expand our functions. We must turn our interests outward and become a service to the community. We can give presentations and demonstrations to schools and groups of youth organizations such as the Girl Scouts and Boy Scouts. We can provide a source of information for computer users at all levels of experience. The golden irony is that we, the user group members, will be the primary beneficiaries of this evolved concept. We can make a positive contribution. Shall we?

AUSTIN ATARI COMPUTER ENTHUSIASTS

AACE

Our new slate of Officers has generated some new activity in the Club. We have a new MIDI SIG that is six months old, and have just started our second C class. This one is different, part tutorial, part hands on. The only problems were installing the new compiler for the 8 bit users and getting the Mark Johnson C in the ST library to work at all(we didn't have anyone who spoke fluent UNIX). All in all this class was more fun than the last one.

We are still looking for a semi permanant meeting room. All of the options turned into duds because of location, size, parking, and most importantly-liability insurance(it's a killer). It really is too bad that our old place turned into a dud. But we'll meet the first Wednesday instead of the first Thursday since it's time for a change. Our current meeting is a combined Disk Party, General Meeting, and Officers meeting, but it gets kind of cramped both in space and time.

Both our ST and 8 Bit libraries have been revamped, with more changes coming. They will be easier to access, and have more data per disk at the same price-the ST will be double sided and the 8 Bit will be flippy(SD). 8 Bit lists are available, with new disk update lists printed as needed. Early summer should see the 8 Bit library finished with more new lists printed. Also in early summer will be the AUSTIN COMPUTER FAIR. We have attended that in the past and may this year provided we can get a lot more volunteers and more organised than last.

Atari Club Minutes - From February 5,1991 Meeting

The meeting began with very few announcements. Club members were reminded to take advantage of the club's public domain library. Any member who buys a disk from the library and demos the software on that disk at a meeting gets subsequent disks free as long as each disk is demoed at a club meeting.

The majority of the meeting was a demo of the Club's bulletin board by the board's sysop. We actually called the board from the meeting and the sysop stepped the members through the features on the board. We left messages, learned about access levels, and were exposed to the various menu functions of the board. Members also saw Bobterm (the excellent terminal program by Bob Puff) in action.

A short and bug filled demo of a new database program written by the president concluded the meeting. Another version of the program was promised for the March meeting. This program is being developed in an effort to catalog the club's public domain library and give the members an interactive database for finding the software that they need.

Also, donations for Bob Puff were taken at the January meeting. The final total for the donations will be announced at the March meeting, and a letter to be sent with the money will be passed around for the members to read.

STARFLEET MEETING MINUTES by Thomas Oughton

February 8, 1991 Officers present: Guenther, Robique, Oughton

The meeting started with a total of 5 members present. Anyone who wants to attend our meeting, we now meet at Pomona High school in Arvada, Colorado.

Mike, who went on vacation last month, when to Las Vegas and attended the CES (Consumer Electronics Show). He showed pictures of the Atari booth. There was lots of ST and Lynx equipment, there was even 7800 and 2600 equipment, but there was NO 8bit hardware or software.

Mike decided that with the lack of new 8 bit software, we needed to support the programmers that produce 8 bit software. Starting with Bob Puff, we are taking up donations to send to him to show our (and Atari Clubs of Denver's) support. With only 5 members present, we gathered $15 in pledges. This will be sent with a letter, and the money gathered by ACCD to Bob Puff. Mike demonstrated several programs created by Bob, including Superarc 2.4 and Discomm 3.2.

In December, the Atari Club of Denver started to catalog all the disks in their library. To speed up the process Larry Richardson wrote an Action! program to catalog the disks in the P.D. library. This program has been updated since December and is even easier to use. There was still a bug when used with a Happy equipped drive. I hope that it is soon fixed and available in the Starfleet library.

To conclude the meeting, I demonstrated the Electronics Arts program "D-Bug". In this program the player has to "d-bug" a simulated computer. While he/she is "playing" a game, the computer will fail and exhibit a symptom. Using this symptom the player has to decide which area of the computer has failed. Parts need to be bought and then replaced. While this game is designed for children, anyone who wants to know how a computer works could use this program. This game is fun to play for a while, but a lack of options make this game boring after a short while. It spends months in the disk box not being used.

The meeting broke up at 10:00 p.m.

The STig meeting opened on January 15, 1991 at 7:15 p.m. at our new meeting place the Aurora Public Library. While Ed talked to the new people about what the STig is, there was a demo on pictures that Jeremy Fason made.

The basic topic was how to properly take care of a mouse. Members were then asked if anyone was interested in buying disks from the STig at the price of $.50 each. There was a good response so Lou will order about 100 disks.

Ed then showed us how to hook up a moniter using an Omniswitich box. Next was a demo of the game OverLoad. This is a very good game that sells for about $50. The best demo of the evening was on how Midi Maze uses the midi ports on the ST to play up to sixteen STs at one time. The January meeting starts the 6th year for the STig. The meeting broke up for the general talk session at about 8:45 p.m.

The Atari Club Minutes

March 5, 1991

At the February meeting our president, Larry, attempted to demo his latest version of The File Information Program only to have it not recognize the data disk. In the month since the meeting Larry fixed the problem and added more enhancements.

Larry had a last minute engagement and could not attend the March meeting. Mike graciously agreed to fill in bringing with him the latest version of the File Information Program v 1.1 dated 2-26-91. Mike proceeded to demonstrate the new features of the program.

(1) In display mode the letter 'B' will display the previous record. Using the 'B' is much more convenient than having to use 'P' since the 'N' and 'B' are right next to each other.

(2) Pressing the # sign and then entering a record number will jump directly to that record. This method is much quicker than stepping through a large number of records.

(3) category selection no longer requires scrolling through the entire list. Pressing a letter will display the first category in the list that begins with that letter. Example: Press 'D' and "Data Base" is displayed in the category field.

(4) While entering a description, the previous contents of the detail field may be recalled by pressing CONTROL R. This feature can save a lot of typing when entering many files whose descriptions are just slightly different.

Mike had a total of 20 records on the data disk when he demonstrated the search routine. The program took only a fraction of a second to search through 19 records and find the match in the 20th record. According to Larry's estimates the program should be able to search 600 records in about 5 seconds. With that kind of speed this is just the program that we have been looking for to catalog the club's disk library.

Several people made suggestions for possible improvements in future versions. The remainder of the meeting consisted of questions and answers pertaining to The File Information Program.

NOTICE!!! NOTICE!!! NOTICE!!!!

JUNE 4, 1991 will be the next swap meet for the Atari Club of Denver. Be sure to bring those unused items that you want to sell. Also be sure to bring some money so that you can pick up those special items that you have been wanting.

Starfleet User Group Minutes

March 8, 1991

The March minutes for Starfleet is almost an exact duplicate of the Atari Club minutes. Mike again demonstrated the File Information program. Several more suggestions for minor improvements were made.

Our newest member donated $10 to our collection for Bob Puff. The new total is $70. We will be sending Bob Puff a Money Order for $70 along with a letter of appreciation for the many programs that he has written for the Atari 8-bit.

The meeting ended with some disk copying and informal discussions.

ACCT

Atari Computer Club of Toledo club members receive, as part of their dues, Atari Interface magazine and access to the 8bit and ST public domain software libraries. Disks are $2/8bit and $4/ST. Non-members may purchase disks at a slightly higher cost.

ACCT meets on the second Monday of the month, from 7-9 pm at Bassett's Health Foods, 3301 W. Central Ave (Westgate Shopping Center), Toledo, OH. ST Sig held monthly at the home of David and Brenda Micka. Dates and times announced at meeting. ACCT may be contacted at 4487 289th, Toledo, OH 42611 or by calling Dave Micka at (419) 729-1891 or Michael Justice at (419) 242-7797.

ACCEPT
Atari Computer Club of El Paso, Texas

ACCEPT (Atari Computer Club of El Paso Texas) ACCEPT is the only Atari club in the entire El Paso southwest. Membership to ACCEPT is $20 a year. A membership in ACCEPT will get you the magazine your holding for an entire year, discounts at Jenkins' Computers and on various ST publications. Technical help, and access to one of the largest PD libraries in the US are also thrown in for good measure. Special access to the STE-EP BBS, an ACCEPT members BBS is also a privilege of membership. Make checks payable to: ACCEPT 10953 Yogi Berra El Paso, Texas 79934

BBS support for ACCEPT: STEP El Paso: 915-755-STEP STE-EP BBS El Paso: 915-821-9220

ACCEPT executive committee Steve Bruck, Tim Holt, L.R.'Pete' Rosh, Dave Davis

From the Prez...by Tim Holt

Musings on a rainy afternoon: I don't remember SMAUG, but it was the Atari 8 bit user group that was alive and well in El Paso during the days of the XL/XL and all the other permutations of the original Atari home computer. From what I heard, a few things that happened to SMAUG that I think this club could learn from.(SMAUG by the way, stood for Sun Metro Atari Users Group. It also was the dragon in the Hobbit, and it croaks in the end. So did the user group.) A few of the original members of SMAUG formed the ST Club, which is now ACCEPT.

SMAUG started out as a user group to help people with problems in running their computers. SMAUG became an elitist group of just a few people, that got together once in a while, and from what I gather, became a group of pirates. When the ST came out, those that could afford STs bought STs, (these were the guys in power by the way) and those that were left with the old 8 bits got left in the dust. The group fell apart because the ones that had the 8 bits would not say anything to those that had the STs, feelings got hurt, and since no one showed up at the meetings, the group fell apart.

Essentially, APATHY was what killed SMAUG. No one cared anymore, so the once great dragon crawled into his cave and died. Sad story, but what does it have to do with ACCEPT? Well, I feel quite a lot. Let me explain:

I missed the February meeting of ACCEPT. What happened there? Well, from what I hear, a bunch of you sat around a twiddled your thumbs until you decided there was no show for that day, and you went home, upset because there was no one there to lead you; like a bunch of lost sheep. No Tim, no show, let's go home. Now, for those of you that got mad AT ME, let's look back a few months at these notes: I asked members to start bringing their systems to the meetings. How many STs were brought to the meetings?? I asked for ANYONE to volunteer to do a demo, of ANYTHING! How many of you took me up on that? NONE!(If you do not believe me, look at the December and January AIM's)

Listen folks, I have news for you, I am not the only person in El Paso that knows how to run an Atari ST, and there are a bunch of you in the group that know much more than me. I am not the only persoon that buys programs. If one person brought a system and one program, you would have had something to talk about. If one person volunteered to do a demo, then you would have had something to do.

Okay, I hear the cries now: "My system is too COMPLICATED to unhook, and bring down to the library." Hey, I have been unhooking my system with hard drive, modem, two monitors, midi cables, synthesizer, and printer for the good part of two years now. If I can do it, you sure as heck can do it too. "I have no programs, so I can't demo anything." Look, you have a computer, you must have a pd program or two. Bring it and show how to run a pd program that grabs your fancy. Who gives a flip if you put on a song and dance, this is a user group, not a beauty contest.

I was on STE-EP and asked the question: If I died, would the club die too? I guess so, cuz it looks like you folks don't have a neuron between you when it comes to getting a meeting on. It doesn't take Einstein to do a demo. I am evidence of that! If you have the idea that the officers of the club OWE you anything, well you are dead wrong. The club is just as good as YOU make it. If the club doesn't meet your needs, it's because you aren't doing anything to help it. And no, showing up at the meetings and sitting like a vegetable is NOT doing your part. Sorry if you got that idea from somewhere.

Okay, so, what does all this have to do with SMAUG? Well, SMAUG died for the same reason that there was no demo at the last meeting: APATHY. No one cared enough to make it work. No one cared to bring a computer to the meeting. And what happens when folks start buying TT's? Will we start falling even farther apart? I hope not, but only you folks will determine if we do or not...

Finally...

I would like to take this opportunity to thank all the members of ACCEPT that brought their computers to the meeting on the 9th of March. James Blount, Ricky Meleschi, Paul Stampfli, Pete Rosh, and Thomas Wagner. James Blount was showing off his desktop publishing, Ricky was showing the new D&D game, Paul was showing what a good Macintosh his Mega makes, especially with Spectre 3.0 running smoothly, and Thomas was showing his switchable TOS 1.0 to 1.4. Thank you all. I also had my ST set up, so we had 6 machines running. And the lights didn't even dim. I thought they were going to when we plugged the Coke machine into my power strip, but thank goodness no.

If you missed the meeting, this was the type of meeting I had envisioned for about a year now. There was enough going on for everyone to be happy, there wasn't anyone without at least something to look at, and everyone was happy. I guess my little tirade on STE-EP and in last month's minutes may have made an impact. PLEASE PLEASE PLEASE continue to bring your systems to the meetings! The meeting was 300% better than in the past. If you haven't come to a meeting in a while, remember to bring your computer when you do!

I would like to welcome some NEW members to the club: William Boyd Sr., and John Treible. I would also like to welcome back to the club: Ricky Meleschi, Bill Marquis, and Jay Hartley.

Let's keep the ball rolling. Tell you friends about Atari, invite your MAC and IBM friends to join our group, and keep on computing!

Tim

ACORN
Atari Computer Owners of Rochester New York

The Atari Computer Owners of Rochester, NY (ACORN) meets on the 2nd Wednesday of each month at Brighton High School, based in room 262S. Before each meeting, a STarter class for the ST meets at 6:45 pm and a Basically Speaking class for the 8-bit starts at 7:00 pm.

ACORN operates a BBS at (716)436-3078 with 52 megs of public domain downloads for the 8-bit and ST systems. Our mailing address is POB 23676, Rochester, NY 14692. Dues are $18 per year which includes access to the club's PD libraries, enhanced access to our BBS, and subscriptions to our newsletter, the ACORN Kernel and to Atari Interface Magazine.

President	Don Allis	(716) 293-3415
Executive VP	Albert Yarusso	(716) 244-4487
8-BIT VP	Nick Cup	(716) 266-1648

Atari Computer Owners Resource Network
Fort Wayne, Indiana

ACORN, the Fort Wayne area Atari users group, meets at the Georgetown branch of the Allen County Public Library on the first Saturday of each month beginning on at 10 AM. Annual membership dues are $18. Call our BBS at (219) 744-1396 for more information or write to us at ACORN c/o Ken Helms, 3627 Iowa Court, Fort Wayne, IN 46815.

CALENDAR: Tentative schedule for the demonstrations at the monthly meetings are: February, Computer Utilities; March, Business Software; April, Programming Languages; May, Music; June, Telecommunications; July, Three Rivers Festival

Notes from the Fort Wayne's ACORN.

February 1991 -- Highlights of the February Meeting: Scott Schaffer demonstrated Home Filing Manager on the XL/XE and Karl Fadus demonstrated NeoDesk for the ST. Mike Surface from T&H Electronics demonstrated several new games released for the ST.

Several members are planning on attending the Windsor/Detroit International AtariFest on May 4. The date, unfortunately, is when we would usually conduct our May meeting so we need to discuss delaying our May meeting until the 11th.

We have received the application for our Three Rivers Festival event. This will be the fourth year we have sponsored "The Magic of MIDI Music and Much More!" so everyone mark their calendars for July 13th, St. Francis College in Fort Wayne, Indiana beginning at noon. Volunteers to help with the planning are always welcome. We have always had a professional musician at the event and any suggestions for this year are welcome.

Notes from Fort Wayne, Indiana's ACORN
March 17, 1991

March Business Meeting: A vote was taken to proceed with an association with the local chapter of the IEEE. It was also decided to proceed with our Three Rivers Festival event: The Magic of MIDI Music and Much More! It is planned for July 13th at Saint Francis College and this will be our fourth year with the event. Spread sheets were the scheduled topic for the demonstrations at the March meeting. Scott Sorg demonstrated Opus, a shareware spread sheet for the ST. Eric Converse demonstrated Calc Magic for the XL/XE which is on one of the monthly Antic disks. Mike Surface demonstrated Hard Drivin' II (which includes an extensive track editor), F-29 Retaliator, and Lost Patrol.

Officer's Meeting: The application form for the Three Rivers Festival event has been submitted. A revised Memorandum of Association has been drafted and given to the IEEE chapter president for approval. With several members planning on attending the Windsor AtariFest in May, the May meeting will probably be rescheduled to another weekend.

ATARI FEDERATION

Regular meetings are held at the VAFB Federal Credit Union, Vandenberg Village, Califorina on the first Monday of every month at 7:00 P.M. Dues are $10 for individual or $15 for family membership. The Atari Federation maintains a PD software library for both 8-bit and ST computers.

President	Phil Rominger
Vice President	Bob Ribortone
Secretary	Matt Matias
Treasurer	Herb Kanner
Newsletter Editor	Jerry Sullivan
8-Bit Librarian	Chester Hadley
16-Bit Librarian	Charlene Rominger

Atari Federation, P.O. Box 5367, Vandenberg AFB, CA 93437

Secretary's report: Feb.'s meeting had a turn out of 13 or 14 people (could be better). Phil reviewed what was new with the Atari world. (This seems like a minor item for the minutes, but I'd just like to let Phil know that I for one, appreciate all his hard work in preparing and presenting 'What's new with Atari' each month.)

We have a new BBS serving our club (and others) 24 hours a day, "Sunny's Garage" at (805) 734-2100. A vote was taken of the members present, it was decided that our club will be purchasing the AIM 8-bit Disk of the Month. We should be seeing it soon. The Demo's for this month took a back seat to everyone's socializing.

Support your club, show up for the next meeting. Next meetings: April 1st - May 6th - June 3rd.

Atari Federation, P.O. Box 5367, Vandenberg AFB, CA 93437

Secretary's report: March's meeting was led by Bob Ribortone, our VP, filling in for Phil. Bob did the review of 'What's new with Atari'. Also, that there is someone considering the feasibility of coming out with an ST emulator for the PC. (I guess it's our turn now.) We had two ST demos, Bob showed off what the shareware program 'Go-Go ST' could do. And Mike gave a very indepth demonstration of 'Hot Wire' and sone of its extra accessories.

Just to let our members know, we did subscribe to the new AIM 8-bit Disk-of-the-Month. We are expecting our first issue soon. Eric Daniels stopped in for a visit. He wanted to remind all of our 8-bit users that his BBS is up and running. Give him a call at (805) 929-1624. Also, the suggestion was brought up to use Sonny's Garage BBS, (805) 734-2100, as the club's main board. Any comments?

One last thing, the group showing up for the monthly meetings is getting smaller and smaller. Support your club, get out if the house once a month, come to a meeting!

Birmingham
Atari
Computer
Enthusiasts

President	James Gilreath	(205) 854-1075
Vice President	Todd Price	(205) 787-8208
Librarian	Dennis Evans	(205) 923-8756
Treasurer	Alan Brewster	(205) 591-9906

Club dues are $15 for regular and $25 for advanced. Advanced includes an AIM monthly disk, specify ST or 8bit. BACE meets the second Monday of every month at 7pm in the Vestavia Hills Public Library, downstairs.

For membership info, call Alan Brewster, or the Matrix BBS Conference #7 (205) 323-2016, or 251-2344, and leave a message.

B.R.A.C.E.
Bluegrass Region Atari Computer Enthusiasts

B.R.A.C.E. (Bluegrass Region Atari Computer Enthusiasts) meets the third Sunday of each month from 1 - 4 PM. Current membership dues are $15 per year for an individual membership, $20 per year for a family membership and $10 per year for an associate membership. (An associate membership includes receiving the monthly newsletter, but excludes the use of the library.) Members of have extra privileges on The Abyss BBS (606) 223-2782.

BRAG ST

Buffalo Region Atari Group for ST's

BRAG ST was founded in 1987 to serve Atari ST owners in the Western New York area. General Membership Meetings are held on the third Thursday of the month at Erie Community College North Campus, Room S-105 in the Student Center. Setup begins at 7:00 PM; Meeting starts 7:30 PM. The Board of Directors meet on the the first Tuesday of the month at the Your Host Restaurant, Harlem at Sheridan at 7:30 PM. All are welcome to attend. Piracy will not be tolerated at any BRAG ST function.

BRAG ST, PO Box 1035, Buffalo, New York, 14225

Chairman	Mark Pierro	(716) 691-7844
Vice Chairman	Ken Malark	(716) 683-1272

Disk Librarian	Carl Barron	(716) 885-4325
Public Relations	Harvel Hontz	(716) 689-8074
Graphics	Dick Kersting	(716) 839-0494

Our January 17, 1991 meeting was opened by Chairman Mark Pierro at 7:35 pm. We noticed that there were 3 new faces (and potential new members) present, so Mark gave a quick review of the purpose and function of the group.

The first demo was Shadow Warrior, which was tried out by our games expert, Jeff Hontz. While Jeff tried to keep alive in the game, we went into a discussion on indispensable software. The catagories and programs were broken down as follows:

My favorite software: Hot-Wire, Word Up, Dcopy, Data Manager ST, DC Desktop, DC Squish, Falcon, Calamus and Cyber Paint.

Boot disk programs (AUTO Folder and Accessories): Maxifile, Little Green File Selector, Quick ST, DC Showit, Folderxxx, G+Plus.

Stuff I wish I had: Hard drive, LDW Power, Gadgets 68030 board, More Memory, TT 030, Silhouette, Omni Switch, Model Trains (to which a member promptly pointed out could be ordered from ANTIC!).

We then had our usual break for disk sales and raffle. John Forgettee was the lucky winner (again) of Shadow Warrior.

The meeting then continued with an open discussion. Then, our newest member, Michael Burkley, gave us a world-wind tour of many of the programs in his collection - Calamus, Shuffle Puck Cafe, DC Utilities, just to name a few.

It was quite a productive evening, with the group picking up two new members. The meeting adjourned at 9:50 pm.

The February 21, 1991 general meeting was called to order a 7:30 PM and got off to a great start with two indiviudals signing on as new members of BRAG ST. After a general discussion of the latest news in the Atari world, Chairman Mark Pierro passed around a copy of the recently revised PD/Sharware listings. The "new" library is now on double-sided disks (single sided drive owners can get the disk of their choice made up for them at the meeting) and includes the latest versions of popular programs.

The first demo of the night began with Michael Burkley showing off WordFlair, a fairly comprehensive "document processor". While the program was impressive, it really needs 1 meg of memory and a hard drive to use it to its fullest (monochrome monitor recommended).

At the break, we raffled off "Shuffle Puck Cafe" and the lucky winner was Gerry Genson.

Our next demo by Mark Pierro was STalker, a powerful telecommunications program with a built-in mini-word processor, STeno. The main feature of this program is that it operates completely in the background. Both programs can work as either a desk accessory or a stand alone program. Highly recommended.

Next, Mark gave a run through of the BRAG ST "starter" disk for a new member who requested some help in basic file operations.

The meeting ended with an open forum discussion that lasted until 9:45 PM.

COOKEVILLE ATARI COMPUTER ENTHUSIASTS

Cookeville, Tennessee

Cookeville Atari Computer Enthusiasts—c/o Robert Pecora—280 Capshaw Drive—Cookeville, TN 38501—Cookeville A.C.E. meets on the first Saturday of the month at 1:00 p.m. at the Putnam County Library in Cookeville, Tennessee.—Cookeville A.C.E. caters to Atari ST and 8-bit computers and is supported locally by The Generic BBS, Terry Rapp - Sysop.—C.A.C.E.

President	Dan Hale	(615) 526-8002
Secretary	Robert Pecora	(615) 528-7116

CDACE

Capital District ATARI Computer Enthusiasts

The Capital District Atari Computer Enthusiasts was founded in 1981, is located in Albany, N.Y. and serves Albany, Schenectady, Rensselaer, Saratoga and surrounding counties in upstate New York. XL/XE meetings are currently held four times a year on a quarterly basis and ST meetings on the last Wednesday of the month. CDACE meetings are held at the Computer Cellar, located in Westgate Plaza, Albany, N.Y.

The club has extensive public domain libraries for both computers which are available to members beginning at 6:30 PM on meeting nights. ST disks are priced at $2 while the XE library continues to remain free to all members.

Dues are currently $20 per year for each family. This includes a subscription to AIM magazine, full access to the club BBS, and our monthly newsletter. The club actively promotes the use of all Atari computers through demonstration and application and welcomes non-members as well as members to visit a meeting and share ideas.

President	Bob Thompson	518-439-5356

XE Librarian	Ian Herrick	518-432-8513
CDACE BBS	300-2400 24Hrs, 7 days	518-237-1232

Central Connecticut Computer Club

The Central Connecticut Computer Club is the oldest, still operational Atari club in the state. Conceived in December of 1980, and operational in January of 1981, the CCCC continues to serve the Atari community. New blood is welcomed, and of course, old hands are always welcomed back.

Meetings of the CCCC are on the third Wednesday of each month. The meets kick off at 7:30 and usually include presentations or demos of various hardware or software items. The meetings are held at 127 Pinnacle Rd., Bristol, Ct. 06010

Prospective members may call Rich Scheidel (203)589-3738 or call Gary Jones (203)225-4611, or write, CCCC, 127 Pinnacle Rd., Bristol,Ct. 06010.

Dues are $25 per year,$30 for families. Includes Voting membership, Atari Interface magazine, access to Club library (8-bit and ST) and access to the Club magazine library.

Hello again. As you no doubt noticed, I have been lax in keeping you informed of Club activities and happenings. I hope to keep up with the deadlines from now on. Let's go back a few months and catch up.

Oooo! That far back, eh? OK.....Went to the New England Atarifest in Boston waaay back in October. I was pleasantly surprised to run into Joe Mirando towing his camera and fiancee around the main hall at a rapid pace. We then hit up all the User Group and vendor displays. Even got to rib Rick Flashman about where in the world was my Neo 3 update (which, incidently, arrived several days later). I even split with some dollars and picked up an ICD Micro host adapter for my Mega. Impressive show...I made arrangements for a video of the Fest made by South Shore Atari Group for the members that couldn't make it.

November..Held meeting at 7:30, my place. Prime subject for the night was NeoDesk 3...MY NeoDesk 3. We ran it through all its paces and generally got it set up to run off floppy. Yeah, yeah, I know. Get a hard drive. You want to front the money?? Anyhow, we all had a good look at NeoDesk, a production unit this time. Next up was the AIM disk. Ran that through and gave it a "thumbs up"...good job.

December meeting...Prime subject? Portfolio! Joe brought his (gratis to WAACE) unit and the latest peripherials for the 'folio. Interest was high as we hooked it up to my Mega and transferred info back and forth. Several of the members use IBM at work and could see posibilities there. Fired up the AIM disk and checked it out...more good stuff. Keep it coming! Last up was to let members play with Lucasfilms 'Their Finest Hour". Also Tim Brandt, our librarian, showed up!! Know what it's like to see someone that you thought fell off the face of the earth? Welcome back.

January meeting...started off with AUA newsletter disk only to get interrupted by the war. Gary didn't show up with the AIM disk and we drifted to the tube to watch CNN do its thing. I got ahold of the 'New' Atari Explorer magazine and several British mags and passed them out to check out. Good luck to Explorer....we need U.S. magazines.

February meeting?? Not yet, but its looking good. Speaking of February, I actually recieved my AIM in the same month! Oooo! Guess what? I also recieved the video of the Atarifest today (Feb.11th) They could have used a little filmwork coaching, but all in all, not a bad job. Loved the credits at the end..they used a Commadore Amiga 2500 for the titling..heh. I also had the opportunity to help out a user in New York. He called me up using our ad in Computer Shopper. He needed a copy of Atari DOS 2.5...it was on its way in 2 hours, right after I got home. Now that's the way it should work!

CRAG Calumet Region Atari Group

CRAG Calumet Region Atari Group PO Box 10995 Merrillville, IN 46411-0995 CRAG, is a club for users of the Atari ST, STE and MEGA ST computers. CRAG meetings are held on the second Wednesday of every month at Broadway Music, which is located in Greentree Plaza, at 1509 West 81st. Ave(U.S. 30), Merrillville, Indiana. Meetings begin at 7pm.

Membership in CRAG is open to anyone. Dues are $15.00 a year and entitle you to a subscription to Atari Interface Magazine, as well as discounted prices on CRAG's Public Domain/ShareWare Library disks. Library disks are double sided. Cost per disk is $2.50 for members $4 for non-members. For more information call:

Jeff Coe (219) 663-5117 Randy Noak (219) 663-6912

President's Ramblings by Jeff Coe

This is a brief message to other Atari clubs out there in magazine land.

Since CRAG decided to pitch in with the other fine User's Groups that are using AIM as their club newsletter, or at least as a suppliment to their newsletter, we've been contacted by a large number of other groups. While we certainly appreciate being included on these mailing lists, I have to admit to feeling a little bit guilty. You see, the main reason for our switch over to AIM, instead of publishing our own newsletter was that AIM is less expensive! Other than a one page flyer every month (just a memory jogger about the up-coming meeting), CRAG no longer publishes anything, therefore we have nothing to offer in exchange.

So as I said before, we love reading your newsletters every month, and we appreciate the fact that you send them to us. We hope you'll continue to do so. But please don't be offended by our lack of responce, as we have nothing to respond with.

Club Notes...

The PD Library WILL be re-organized by the time you read this. I promise! We finally found a program we like that has the features we need, so you'll all get an updated list at the next meeting. Keep in mind that we're also offering the AIM Disk of the Month, as well as our own compilations of PD/ShareWare programs, so you all have a big selection of software to choose from. Coming up is a new utilities disk. The good folks at Double Click Software have been giving us a program a week lately, and it's all been good stuff. Lots of other goodies will be on there too.

I'm still having trouble coming up with meeting demo topics each month. I'm not getting any feedback from you folks as to what you want to see. More importantly, I'm not getting any offers from you to do demos yourselves. I'm sure you must be sick of me fumbling along each month, so please, volunteer.

That's about it this month. Remember, support the people that support Atari computers. Don't pirate software.

CUSTUG Champaign-Urbana ST Users Group

The Champaign-Urbana ST Users Group (CUSTUG) meets at 7pm on the second Wednesday of each month in the Auditorium of the Urbana Free Library at the corner of Elm and Race in Urbana, IL. Membership dues include a subscription to AIM and GLITCH and use of the commercial lending library. New members are welcome. The group supports a local BBS, Blackhawk's Keep, operating 24 hours a day at 3/12/2400 baud (1/8/N): 217-892-5512.

FACCS

First Atari Computer Club of Spokane

We currently own and maintain a 24-hour Bulletin Board System (BBS), open to everyone with a 300, 1200, or 2400 baud modem, called the Atari Zone 509-326- 5741.

Since we currently have renewal dates scattered throughout the year, please check your card for your current expiration date. Remember, once your membership expires we are no longer able to send your AIM Newsletter or allow you to remain at the F.A.C.C.S. level on the Atari Zone. To prevent interruption in your F.A.C.C.S. services please renew by the expiration date on your card.

The FRACUS user group meets the last Saturday each month, at 6PM, at the Four Seasons Moble Home Park Rec. room in Fresno, CA. We have a large public domain library with over 400 programs. The club also has a 24hour BBS. All 8bit Atari users are welcome to our meetings and to use our BBS (members have an additional sig on the BBS). Dues are currently $20 annually or $5 quarterly which includes a subscription to AIM and issues of our periodically published newsletter. We currently have 16 active members and are continuously growing.

GRASS

GRAND RAPIDS ATARI SYSTEMS SUPPORTERS

GRASS meets the first Wednesday of every month at the Wyoming Public Library, 3350 Michael S.W.. Doors open at 6:30, meeting starts at 7:00pm. Dues are $22.00/yr. including AIM. Bring in one PD software disk and get 2 blank disks for your time.

G.T.A.U.G.

The Newsletter of the Golden Triangle Atarian

The GTAUG has been 'around' since 1981 and supports both the 8-bit and 16-bit communities. Meetings are held the first Tuesday of each month at a location announced in the previous meeting.

At present our dues are $24 per year (Our year begins in September.) and is pro-rated at $2 per month for new members the first year. Since our nearest dealer is 90+ miles away, it is imperative that we support each other. It is for this very reason our group is a fairly close and diverse. We support all facets of Atari computing from 8-bit to Spectre/Mac to IBM and MIDI.

JACS

Jersey Atari Computer Society, P.O. Box 710, Clementon, NJ 08021 BBS: (609) 346-1224. The Jersey Atari Computer Society is the oldest and most experienced user group in the South Jersey/Delaware/Philadelphia area, having been formed in 1983.

The regular JACS meeting is usually held on the third Tuesday of each month, at the Camden County Library from 7 to 9 PM. The regular monthly meeting includes topics of interest for users of all Atari 8-bit & 16/32-bit computers. Yearly membership dues (August, 1990 - July, 1991) are $24. As a JACS member, you'll receive a subscription to Between Bytes and AIM, and full access to our 24-hour bulletin board. Copies of the Z*Net newsletter are available for all members at our regular monthly meetings.

JACS public domain disk libraries (for all Atari computers) currently includes over 200 disks, available for $3 (members) or $4 (non-members). JACS ST library now includes the AIM DOM. Send a stamped, self-addressed business size envelope to receive a copy of our current disk catalog - please specify 8-bit or ST!

The LACE Club Meets in the basement of the Clearfield Library second Wednesday/ month at 7 p.m. Next meeting May 8, 1991

Middle Georgia Atari Users Group

M.G.A.U.G.

The Middle GA Atari Users Group is the sole Atari Club in the Middle Georgia area. We are composed of 60 members of which approx. half are ST users. Club president Pete Miller can be reached by phone at 912-328-8758. The MGAUG address is 115 Feagin Mill Rd., Warner Robins, GA 31088. MGAUG meets the second Sunday of each month at 1 PM at the Warner Robins Library. Annual dues are $5 with the newsletter optional. Use of the club library is free tc all paid members.

March Meeting: The March meeting saw a good turnout with some members comming that we have not seen in a while. We had about 20 members with many lively discussions going on. Members seem to have their hopes up that Atari may be ready to do something in the North American market this year.

Lee Mavity was nice enough to bring his European Magazines to the meeting. It is always nice to see what's going on overseas especially for you joystick fans. Some new releases that caught my eye are TEST DRIVE II, HARD DRIVIN II, BLUE MAX, DAS BOOT, STRATEGO, MIG 29 FULCRUM and SIM EARTH to just name a few.

Lee also had two PC upgrades for sale PC SPEED ($100) and PC DITTO II. Anyone interested in these bargains should give Lee a call.

We had some demos at the meeting. First or all everyone was able to see the Atari used with the NEC 3D monitor for the first time. The monitor works great but is probably to costly for most members. Also in use with the NEC was the OMNISWITCH from Talon Industries. OMNISWITCH has buttons for selection between color and mono monitors if you have both, or 9 and 15 pin connectors for the connection of a multisync monitor such as the NEC. It also has 2 disk drive connectors and a switch so that you can switch between disk drives if you wish to add a third drive or a 5 1/2 in. drive. Finally there are composite video and audio jacks. The audio jack is a must for Multisync monitors because they do not have an internal speaker.

We also were able to see a Demo of HARD DISK TURBO KIT in action. HARD DISK TURBO KIT allows you to back up your hard disk as an Image or DOS file. It also allows you to repair any fragmentation that may be occuring on your hard disk. Fragmentation occurs when for instance you read a DOC file into your word processor and add some work to the file. When you save the file back to the hard disk it will no longer fit into the space where it was before so the hard disk tacks it onto the endof the data on the partition and a hole is created at the spot where the date was before. The next time the hard disk gets thisfile it must go farther out on the hard disk and it takes just alittle bit longer than it did before. If this is allowed to continue without repair then disk read and writes will slow down. HARD DISK TURB0 KIT alows you to repair this Fragmentation by rewriting the directory so that no holes exsist. You can also optimize it for reading or writing. Reading will locate all of the files at the beginning of the partition for fast access, writing will locate all files at the end of the partition to leave more empty space at the beginning for faster writing. Also included on the program disk is M-Cache a disk cache program. Hopefully next month we will have an upgrade for this program with a new manual.I understand that there is a newer version than I have and I have sent for the upgrade.

Also demoed at the club was the soon to be commercially released adventure game HERO II. This appears to be a fun adventure game that uses the joystick for most movement and menu selection. There are plenty of baddies to hack up and rooms to explore. Be sure to get a demo at the club meeting and check it out. A must for you light adventure fans and easy enough for most children to understand.

We also at this meeting had both the March AIM disk of the month and a disk offered by myself from the club archeives. It was also discussed that perhaps the club should purchase a DC Utilities so that we can make all of our ARC and LZH files self extracting to make it easier especially on new members. For those of you that need some PD software you can give me a call and we can set up a time to come to my home for you to pick up what you might be interested in. Or you can give me a list at the meeting and I will bring your disk to the next meeting.

The next meeting is May 12, hope to see you there.

February Meeting

The February meeting had a good turnout with about 15 members showing up. As most of you know I have been involved with Desert Shield and have been working some long hours. For the first time since the start of the club I did not take my computer to the meeting. Lee Benjamin was once again able to fill the gap and bring his computer.

If you will forgive me for this lapse then I will have a special treat for you at the next meeting. Its your first look at a MultiSync Monitor being used with the ST. I am now typing this using my new NEC 3D monitor - let me tell you that the price was high but well worth it. I also purchased the Omniswitch from Talon Industries and it works great.

The NEC in color works and looks better than the reqular Atari Monitor. You can see shades of color a lot better, especially the darker colors. The colors are not quite as bright but objects are defined better. For instance when playing Falcon you can make out objects on the ground and air sooner and you can tell what they are quicker. Dark objects show out a lot better and I can now see things that I couldn't see before on the Atari monitor.

In monocrome mode the screen is sharper than ever and is more pleasing to the eye. The Atari Monitor, although quite sharp, seemed to me to be a little bright and to have a slight shimmer to it. My eyes seemed to get tired after looking at it for awhile, the NEC monitor has no shimmer at all and is very easy to look at over long periods of time.

The AIM disk of the month has not showed up yet so we did not have a disk of the month for this month. Hopefully it will come soon. I understand that Pattiefrom Unicorn Pub. does all of the monthly disks by hand - quite a job - so everyone be patient. I was certainly pleased with the high quality and selection of programs that we received with the first disk. We have picked up a couple of people who may be interested in the club from Waycross and Atlanta. I hope that they will try to join the club or come to some of the meetings. AIM appears to be showing up in more book stores and some Georgia ST owners are getting our number out of the back of the magazine.

M.A.C.E.

The Michigan Atari Computer Enthusiasts

Members of MACE receive, as part of their dues, Atari Interface Magazine. Members are also entitled to purchase disks from the 8-Bit and ST public domain software libraries. 8-Bit disks are $3 each, and ST disks are $4 each. As an added bonus, if you purchase three (3) disks from either library you will receive a fourth disk of your choice at absolutely no cost. Non-Members may purchase disks at a slightly higher rate. Mail order is also available.

For a catalog of current disks in our libraries, send $2 to:

MACE, P.O. Box 2785, Southfield, MI 48037

MACE meetings are held on the Third Tuesday of each month at the Southfield Civic Center at 7:30pm. The Southfield Civic Center is located at 10 1/2 Mile and Evergreen Rd, one half mile south of the Evergreen exit on the new I-696.

Meetings are in the small pavilion, room 115. Parking is available in the parking garage below the pavilion or in one of the many parking lots on the Civic Center grounds.

If you have any problems with getting to the MACE meetings, please feel free to call on a MACE Officer to relieve you of your confusion. We are always glad to extend a helping hand!

Please come and join us! We are awaiting your visit!

MID-OHIO ATARI USER GROUP

The Mid-Ohio Atari User's Group (MAUG) is again without a place to meet. If you know of any apropriate place which is available, please contact Chuck Steinman as soon as possible.

MAUG membership dues are $8.50 per year for residents of Ohio, and $12.50 for non-residents. Included with membership is a subscription to the Atari Interface Magazine (AIM) at no extra charge. ST users may elect to also receive the AIM ST Disk of the Month, for a total fee of $20 per year ($30/year for non-Ohio residents).

Please make payments out to Chuck Steinman/Maug, and mail them to Post Office Box 134, Ontario, OH, 44862. Payment must be received by the 10th of the month preceding publication, to assure receipt of that month's magazine. Please notice your membership expiration date is is printed on your address label, and renew at least 30 days in advance of that date to assure uninterrupted service.

N.A.U.G.

Nashville Atari User's Group

Nashville Atari Users' Group P.O. Box 121752 Nashville, TN 37212. NAUG meets on the third Thursday of each month from 7PM to 10PM at the Cumberland Museum and Science Center. Membership dues are $24 per family for the entire year. With your membership you will receive our local newsletter, Atari News, a subscription to Atari Interface Magazine, access to the club's 8-bit & ST Public Domain/Shareware libraries, any group discounts on products, and entrance to all club related functions. We have an Associate Membership for $12 per year. With this membership, you will receive Atari News, AIM and access to our 8-bit & ST PD/Shareware libraries. People joining during or after the month of July pay 1/2 the yearly rate. Visitors are welcome to all meetings.

NSAUG

Novia Scotia Atari Computer User Group

The Nova Scotia Atari Computer User Group (NSAUG) is a registered non-profit organization dedicated to sharing information about computing on Atari computers. We will be meeting as one group starting in October (date, place and time to be announced). We own and operate XEST BBS (at 856-0101) which is accessible to all owners of Atari computers. Non-members have limited access to features of the BBS. We are always looking for new members. If you own or are thinking about buying an Atari computer, come on in and see what we do.

We can be contacted either by phone through the executive board or at one of our meetings or by writing NSACUG, 170 Nestor Crescent, Darthmouth, Nova Scotia, B2W 4B1.

President, Treas.	Mike Hundiak	429-2639
ST Vice President	Dave Mason	826-7101
XL/XE Vice President	Hilary McCarron	275-3688
Secretary	Marlene Abriel	434-4430
Newsletter Editor	Steve McCarron	275-368

O-ACEs

O-ACEs is a non-profit group interested in getting more out of Atari computers. We are NOT affiliated with Atari Corp. or any other commercial organization -- we are there for YOU! We cover BOTH 8-bit (including the 400/800, XL, XE, and XEGS series) AND 16-bit (ST series) Atari computers. We meet twice each month (except November and December) on the 2nd and LAST Wednesday each month. Doors open by 7:30 pm at La Vista Recreation Center, 8116 Parkview Blvd. (just off 84th Street, south of Food-4-Less and east of 84th at the light)

FIRST MEETING: (2nd Wednesday) Covers news, views, and decisions that ALL members might be interested in. FOCUS MEETING: (LAST Wednesday) Concentrated information on a single topic (such as word-processing, spreadsheets, music composition, desktop publishing, etc.)

Call 592-5427, for more info on O-ACEs!

Portland Atari Club PO Box 1692, Beaverton, Oregon, 97005

President	David Hunt	286-6276
Vice Pres.	Ben Smith	256-9974
BBS	ACE OF AMERICA	285-4417

The Portland Atari Club meets the first Monday of each month at the Northwest Service Center on NW 18th and Everett from 7pm till 9:30 pm. We welcome both 8 bitters and ST users. All are welcome.

March was a swap meet. We usually enjoy a much better attendance during these meetings and good bargains are frequently found. I would guess that half my personal software was purchased in this manner and at about a quarter of the listed prices. When it comes to games and the like, if you can wait, you can't go wrong. I also have done very well the few times I sold some of my excess stuff.

As a club member you are entitled to a free table at the swap meets to sell your wares from and you are not limited to computer items. The board of directors, under the guidance of our President, David Hunt, is working on advertising our meetings locally and has decided to make some type of advertising a regular routine. We are serious about bringing the knowledge of the club and its benefits to every Atari Owner in the area.

We would like to take a moment and thank Ivan from IB Computers for his surprise visit during our February meeting. He spoke to us about the dealer networks and shared his knowledge of the Atari support network ect. The support between IB and PAC was reaffirmed and strengthened. You may find club membership applications at the store as well as the disks from our club library.

We will continue the swap meets on a quarterly basis. It follows that June, Sept, and December will the the others this year. Please remember that PAC has a strong anti-piracy committment and will tolerate no sales of pirated wares at any club function.

AIM has announced the availability of monthly disks for the 8-bit and you will find these disks at the regular club meetings. Naturally we jumped at the idea of the 8-bit disk and take our hats off to Bill and Patty of Unicorn Pub. for their fine efforts. You will still find our regular library of pd software for both the 8-bit and ST plus the monthly AIM disk for the ST at regular club meetings.

Membership to PACE is $30 ST and $20 8bit per year or $9 per quarter. Meetings are held at 6:30pm on the third Sunday of every month. Membership includes a monthly newsletter, FREE Disk-of-the-Month, FREE printer ribbon re-inking, and FREE copying priveleges to our VAST collection of 8/16 bit Public Domain programs. Ports A.C.E. is an alliance of families with a mutual interest in the Atari 8/16/32bit Computers. PACE hardware assets: 130XE, 1050 Drive, MacInker and a 520STfm. Any written correspondence should be addressed directly to Ports A.C.E., Tracy Hendershot, 4835 Crosley Avenue, Duluth, MN 55804.

Spring has arrived if you haven't already noticed. Did you buy a LYNX for your kids last Christmas? If not, you may still have a chance to please your kids during the next long trip to Grandma's this summer. The LYNX is now selling for under $100. Prices for the STe are reportedly dropping to $499! I will be buying one as soon as I can sell my 1040STf.

The TT030 and Mega STe appear to be the real winners this year. The TT gives the power-user more than they can handle with the Motorola 68030 32Mhz chip. True multitasking is only a click away. Ultra-high resolution of 1280x960 and an industry-standard VME expansion slot for even higher resolutions in the future. LAN capabilities, two serial ports, built-in SCSI harddisk, 2 megs of RAM expandable to 26, MIDI and stereo sound, only scratch the surface of this most powerful Atari computer. No, don't even bother COMPARING the TT to other brands ('386, Mac II or Amiga 3000). Atari has got themselves a real powerhouse!

The Mega STe positions itself between the TT030 and the 1040STe. It sports a 16Mhz 68000 chip; twice as fast as our 1040's. The doubling of cycles only seem make the Mega STe 30-40% faster than its little brother. There are most likely other enhancements internally that take advantage of those 16Mhz. Pluses are it's encased in the TT cabinet, sports a very elegant detached keyboard, an enhanced desktop (TOS 2.05) similar to the TT and a built-in harddisk. I can't wait for the day when we get inquiries from prospective members who have just purchased a TT and want guidance and wisdom from our group of experts!

Next meeting will be April 21st, 6:30pm, Androy Hotel in the Mezzanine.

Summer has arrived in the Northland once again and, I've been told, interest in computing declines markedly. I don't know about the rest of you, but I have been logging an enormous amount of time on my ST. Two programs in particular can take credit for a good chunk this time. Band-In-A-Box 4 and Master Tracks Pro 3.6. Now if I could only Multi-Task and run both of these programs together... No, I'll just tackle them one at a time for now.

I will be receiving information soon about the new 8-bit DOM now available from AIM. We will be acquiring this for our 8-bit users. Hope the disk contains some of those fabulous European programs we have all been hearing about. I'm sure each disk will contain a mixture of the best of the best. I have read that the 65/130XE continue to ship to many parts of the world, including the US. Atari is supporting the machine the best way possible, but support for the 8-bit in the US is declining sharply.

Formal summer meetings for the months of June, July and August will again be suspended for 1991. Lack of attendace in the past has been the reason for this action. However, like previous years, we always seem to get together once or twice in the summer to talk 'tari. Think of this time as a respit and an opportunity to get to familiarize yourself with fellow members on a more personal basis.

Rumor mill: Watch for a new table-top video machine to appear in 1992. Using a 68000 running at 16Mhz, the "Panther" will have phenomenal sound and graphics. A slight clerical mistake at AIM has interruped several of our DOM's for the ST. Hopefully, they will begin again soon uninterruped. PACE loves their AIM DOM's!!! Our club is in excellent financial shape and is continuing to "run itself."

P3Atari Computer Enthusiasts (P3ACE)

The Prez Sez by Rick Reaser

We really are off to a great start. Both SIGs are going strong. 17 people have either renewed, rejoined or joined as new members in the first two months of the year. We are still looking for an 8-bit VP, even though the SIG meetings are still going well.

At the February 8-bit SIG we continued to review various wordprocessors. We looked at Diamond Write, TextPro 4.56, and First Xlent. Diamond Write has a ways to go before it becomes very viable. It's cute and interesting concept concept but not very functional yet. There should be article in AIM soon. We just scratched the surface on TextPro and will continue a discussion of the macro features and the memory banking features. Roger Meston gave an outstanding demonstration of First Xlent's wordprocessor. He even had a handout. First XLent turned out to be a real powerhouse and very intuitive to use. Roger even learned a few neat tricks from one of the people who joined at the meeting that night. We also took a quick look an the 8-bit Tax program advertised in STart. It was functional, but hopefully will be upgraded in future years. We should get a review posted in AIM soon as well on this.

The February ST SIG is planned to be a hardware hacking program. ST VP, Terry Quinn, also requested member request for future SIG meetings. After the meeting, Dave sold several copies of MidiMaze and members warmed up for the MidiMaze tournament, the next day.

Eight STs showed up at Dave's house for the tournament. It was a total blast. The Kosters provided plenty of munchies (and MIDI cables). We also took a look at MidiMaze II from Germany. All the novices loved it, since you can handicap the pros. Some of the feature that players can buy are really deadly (like AutoAnswer). It probably is possible to play this game for days straight.

For those of you who didn't get the word, "Maggie's Place" (the library) has changed its phone number to 531-5531. For those who haven't heard, Steve Leser's hard drive bit the dust so his board is down. Hopefully, he will up again by the time you read this.

In other club actions, we renewed our subscriptions to PSAN, Current Notes and the AIM DOM. Be sure to check these items out at the next SIG.

The ST Atari North Coast Enthusiasts (STANCE) is an independent, not for profit Atari computer user group and is not affiliated with Atari Corporation, or any of its affiliates, in any way.

$12 per Year with a one time sign up fee of $13.00.

STANCE club meetings are held every third Monday of each and every month at B & G Electronics, (located at 15729 Madison Ave., Lakewood, Ohio 44107) starting at 7:15PM

Rushmore ATARI Computer Enthusiasts

9512 A Adams Dr. Ellsworth AFB, SD 57706

The Rushmore Atari Computer Enthusiasts is a nonprofit organization of Atari computer owners not affiliated with Atari Corp. Meetings are held on the fourth Saturday of each month, 2pm, at the Rapid City Public Library. Annual dues are $12 for basic membership and $15 for membership and newsletter (subscription to AIM!). RACE offers the Black Hills Atari owner hardware and software support and the largest library of public domain Atari software in the State of South Dakota.

NO PIRACY WILL BE TOLERATED AT ANY RACE FUNCTION!

President Rick Burton (605)-642-5353 V. President Duane Charter (605)-923-3274 Secretary Joe Weigel Treasurer Ken Kayl (605)-343-7289 NL Editor Mike Harbison ST Librarian Viren Lemmer XE Librarian Ken Kayl (605)-343-7289

President's Particulars

As some of you may have noticed (RACE members or otherwise) I have not been very regular at writing fresh Particulars each month for a while. Rest assured that this does not mean that the club or I have evaporated! Sometimes I do have a tendency to put 30 hrs. of activity into a 24 hr. day and something tends to get crowded out. Yours truly SHOULD have realized this was the case a long time ago but I'm back in the saddle again. (hold the applause)

RACE recently held a MIDI music show with the cooperation of, and at the location of Westmoor Music which is in a local shopping maul. We were set up from about noon to 3:00 on Sat. afternoon and attracted many interested folks who had a chance to see and hear "power without the price" for themselves. This left the store manager pleased that his Yamaha keyboards also got the spotlight and leaves the club with an opening to do another show in the future at the same place. We need to let the world at large know what we are all about-PR & advertising if you will.

Pioneer hacking in the Dakotas: South Dakota has a population less than that of Denver for example. This can make for a geographical challenge to get Atari users together at times- but RACE continues to brave the frontier. A self-described one-man MIDI band from North Dakota contacted me recently with a request for membership. We Atarians must stick together so I'll arrange for a correspondence membership.

We have had some great demos, rap sessions, problem solving, AND have been raffling both 16-bit and 8-bit goodies at our meetings. Don't miss out! See all you RACE drivers at the next get-together. Long live Atari.

S.A.G.E.
SPECTRUM ATARI
GROUP of ERIE

SAGE, PO Box 10562, Erie, PA 16514-0562

The Spectrum Atari Group of Erie, PA was founded in December of 1984 to provide communication and support among owners of all Atari computers. Our newsletter is the SAGE Scroll which is published monthly. In addition to being distributed to all of our members, the Scroll is exchanged with over 50 other Atari computer user groups nationwide. SAGE maintains extensive libraries of public domain software for both the Atari 8-bit and ST computers.

The SAGE BBS has been operating for 5 years at 814-833-4073 (2400 bps, 24 hours). The SAGE BBS offers public access to all of the message bases, and, in cooperation with the Erie County Library offers a unique on-line reference service known as GET R.A.D. (Get Reference After Dark).

The Spectrum Atari Group of Erie meets on the third Sunday of each month at 2 PM at St. John's Lutheran Church in Erie, PA. We also have SIG meetings monthly covering Telecomputing, the ST/Mega/TT computers and programming in GFA BASIC.

President	Dennis McGuire	814-833-4724
Vice-President	Patti Irwin	814-825-0834
Secretary	Earl Hill	

RACC
ROCKFORD ATARI COMPUTER CLUB

WE'RE NOT JUST PLAYING GAMES ANYMORE!

Rockford Atari Computer Club is comprised of avid, dedicated users of all Atari computers. We support and promote the use of 8-BIT, and ST/MEGA machines with extensive PD libraries, monthly meetings, and semi-regular SIGS.

We have had a change of meeting place this year, as our previous site is being used for adult education on Saturdays. We may be able to secure a regular space there, if we can agree to meet at some other time/day (possibly evenings?). Any suggestions, or other alternatives should be mentioned at the meeting. Our regular business meeting is held from 9 to noon, the third Saturday of the month.

We have accepted the gracious hospitality, of the Springbrook Congregational Churches as an alternative meeting place. It is located, off Alpine, just as you make the turn onto Springbrook road, from Spring Creek road. Our mailing address is 3902 15th Avenue 1 - Rockford, IL 61108. Our phone number is [815] 397-5316.

Let's see, I missed a few months getting my AIM report in. But hey! So I remebered this time (at the 11th hour)!

I dropped my monitor into a snowbank as I hurried off to February's meeting (late as usual). It got snow right thru the vent holes, and into the guts I imagined.

Now prudence would have suggested that I really let the thing dry out, say overnight? Well she wasn't there, so I did for....an hour or so. It didn't work when we plugged it into the club ST. Oh yes, I dropped that also, but I had hoped the soft snowbank would have cushioned the blow. Seemed as though the computer was booting, but I didn't have the guts to ask one of the other guys to sacrifice either of their monitors, or computer to test my poor hardware out.

Still unemployed, I shuddered at the thought of a repair bill, I could not afford. (Hmm... there is no intention of rhyming back there) After trying several things, I thought , "Oh well, I still have my MONO monitor." So I was not totally out of business. I made a spur of the moment decision.

It had worked with my hard drive, so why not a monitor? Lifting the beast from the table, with no fanfare, I gave it a smack... then a shake ... then another harder smack!!! "That'll do her I reckon!", not truly expecting it to work. The other club members stared in disbelief. I had told them of my remedy to the hard drive, but I think that they never really believed me.

VOILA! She has a green and white ST desktop! I guess it was the last hearty smack. "Musta been been something loose in there, HUH?" Kids do not try this procedure at home. Leave this kind of professional problem to us...the truly incompetent!!

Meeting Highlights

We finally voted in our by-laws. One of my ideas is that you can (and probably will) be nominated and elected to serve your RACC club, even if you don't attend the next few meetings during nominations and elections. So it might pay for you to show up and nominate a candidate, or just show up so you are NOT elected in abstentia!

Nominations for the five officers positions, are now open, and will run for the next two meetings (March and April). Elections will be held in MAY, with the new board being installed at the June picnic. We really hadn't intended to stay in office for this long.

Frankly, leading a club takes a lot of the fun out of being in a club. And couple that, with being unemployed, my enthsuiasm was way down. I wanted to move the elections up, and have have someone else take over the "reins". But ya know something, I am seeing some renewed interest in our 'lil club.

We have three new members, from our "membership" drive. They are:

Chuck Liljegren
Dennis Renner
Shane Nicely

I am really glad to see some new guys, and welcome them! I guess our campaign has worked, and am truly pleased to see some enthusiasm, work and support, from some of the older members.

Hopefully my Mega STE will be in by then, and Jeff's Stacy will be back from repair, so we can "Show off"!!

R.A.C.E.

Eric Schofield	President	851-5134
Brian Casper	Vice President	851-8092
Lewis Midyette	Secretary	828-4319
Tony Manino	Librarian	851-8092
Jim Harrop	Treasurer	851-5134

Hey gang! Things are cooking up in the Raleigh area and the club is doing great. All of the officers are keeping very busy and I am up to my arm pits in work and things to do. Therefore, this month will have a very short article.

The most important thing is that you all know when the April meeting will be. The April meeting will be held on April 23 from 7-9 p.m. We will be showing members various ways to SPEED up your ST! From software to hardware, we'll try to cover it all. See ya on the 23rd!

Well gang, the new year is well on it's way and things are slowly but surely starting to roll in the proper direction for Atari. The Mega STe's are FINALLY shipping and the TT MUST have FCC Class B certification by the time you read this. The Lynx has been repackaged at $99 which is only $10 more than the plain and drab Gameboy and Atari is redesigning the STacy and the Portfolio. Atari revealed an ST compatible notebook computer (much like the STacy except it should weigh around 7 lbs. and is much more compact), this ST Notebook computer should be able to run for over 10 hours off of the batteries and this is with a hard drive in use! Atari also came out with a computer that has no keyboard at all. This computer comes with a touch sensitive screen and is capable of learning you hand-writing. You're supposed to be able to "write" your commands into the computer. This unit still has some work ahead of it before it is ready for production though. Atari has been busy and there are plenty of GOODIES in the pipeline!

Is it my imagination or does the Atari SLM-605 laser printer resemble the Epson EPL-6000 laser printer? The design is exactly the same, the print speed is exactly the same, I'm quite curious by this. Does anyone out there know? Is our beloved SLM-605 really an Epson in disguise?

The club is always striving to offer the Atari community better support. You already receive this terrific magazine for joining the club, how about another FREE magazine as well? Yes it's true. How do you get it? The only way you can get the magazine for FREE is to come to the club meetings. The magazine is called Atari User magazine and it is being published monthly by the founders of ST Journal magazine out in California. Since we are a users group, we should be getting free issues every month. Enough for all club members but you must come to the meetings in order to get this baby for free!

Next month's meeting will be held on May 21 at 7p.m. at the Richard B. Harrison Library. We will elect new club officers and we will feature the Joppa Send FAX Modem. It is very important that you show up for this meeting because we need new officers. No one ever wants to become an officer but there are benefits for being an officer and the work load really isn't that much if there is enough team work between everyone. If you don't participate, it will surely mean the end of our club. I hope to see you all there.

ST☆R
ST ATLANTA ROUNDTABLE

STAR (ST Atlanta Roundtable) Atlanta, Georgia, meets the third Monday of each month at 7PM. Membership dues are $30 per year. Each member receives a copy of AIM and PD disks. Bring a friend.

Club Minutes for Sat. Feb. 9, 1991 -by Jim Keho

The meeting started at 12 noon. There was 14 total in attendance. Where were YOU??? Treasurers report: we have $268.16 in the treasury.

You won't want to miss the March 9th meeting!! Our special guest will be Bob Brodie. He's supposed to be bringing along a TT and MegaSTe for use to see!! And he's going to give me the TT! Just kidding! Just checking to see if you really read these minutes! :-) It was better for both him and PHAST to have him here in March instead of the Feb. Meeting.. Should be a fun meeting..

By the time you read this it'll be April, so it'll be all over with... But be looking here for how the meeting went next time if you couldn't make it! We had quite a few demos: Deluxe Paint, The Empire Noise Tracker, Planetarium, and the Gravis Mousestick..

In case you missed our new meeting place: Devry College 2149 W. Dunlap Phx,AZ. Room #101 at 12noon! Well that's about it... Until next month, March 9th. Be There!!!

The PHAST monthly meetings are held on the second Saturday of every month at Devry College 2149 W. Dunlap Ave. Phx,Az. from 12pm to 2pm in room #109.

PHAST Club Minutes for Sat. March 9, 1991 -by Jim Keho

The meeting started at 12 noon. There was about 65 in attendance! Boy, wish I could say that every month! <grin>

Of course this was the Bob Brodie meeting and that's why. Wonder if he'd come here every month? <grin> Nah, we're just really glad he has been able to make it once last year and this year too! THANKS BOB BRODIE!! He brought along an Atari TT and MegaSTe computer for us to see. They look great!! In my opinion after seeing the TT and MegaSTe, I think I'd get a TT if and when I purchase my next Atari computer. I currently have a 1040STe and don't see major improvements (that I really need) going to the MegaSTe. But we'll see.. I hope we'll be seeing them available soon at a dealer near us!!

Well that's about it for this time, again I'd like to say THANKS to Bob Brodie, we all enjoyed the informative meeting and seeing the new Atari computers! We also had a raffle for a PHASTdisk of the month, congratulations to the winner! Be watching for more monthly raffles at future meetings too!! We have some good STuff to raffle! In case you missed our new meeting place: Devry College 2149 W. Dunlap Ave. Phx,AZ. Room #101 at 12noon! Until next month, April 13th. Be There!!!

SPACE

SPACE, the Southcentral Pennsylvania Atari Computer Enthusiasts meet on the third monday of the month at the Camp Hill Mall Community Room. The doors open at 7 and the meeting begins at 7:30. Dues are $15 per year and include a subscription to AIM and SPACE Probes, our official newsletter. SPACE was founded in 1982 and is still going strong. We support both ST and 8bit computers.

For more information, call either John Slade, President at (717) 938-3656 or John Hileman, Newsletter Editor at (717) 938-8753 or write to: SPACE, PO Box 11446, Harrisburg, PA 17108.

SEVAC

South East Valley Atari Connection meets the third Saturday of each month at 10 AM at 3234 S. Fair Ln. (Eaton Business Park, just off of 48th Street and Southern), Tempe, Arizona. Yearly membership is $12.00. Membership includes reduced prices on PD ST and 8-bit libraries and monthly newsletter.

President	Marc Dyer	(602) 897-0314
Vice President	John Rojewski	(602) 869-0438
Treasurer	Lee Whiteside	(602) 962-9415
Secretary	David Lyle	(602) 993-2043

SEVAC Report for 2-16

Treasury Report $630

We have 520ST and are upgrading it with the JRI simms board with 2 Meg and starting a ST BBS with Michtron BBS software. No date yet for its operation start. March 16th we will be having a swap meet for any 8Bit and ST hardware and software at our current location in TEMP. After the swap meet SEVAC will be moving, but the location has not yet been decided. We are going to get a Migraph Scanner and Touchup software to be auctioned of at the meeting when we get it. We had two demos. One was changing a 10 Meg hard drive to a 85 Meg hard drive and the other was Marc Dyer making the flyers for the swap meet.

April 20 will be PD day..bring your favorite PD software to show.

May 17 will be Game day..bring your favorite game to show.

June 15 will be Program day..bring your favorite program to show.

STUN

The ST Users Network -- supporting users of the Atari ST, Mega, and newer technology computers. P.O. Box 27285 Salt Lake City, Ut. 84118. STUN operates a 24 hour BBS -- (801)272-4243. Open meetings are held on the 3rd Wednesday of each month at 7 P.M. in the Murray High School.

We enjoyed the demonstration of how the ST and a fax machine can be used together for sending fax documents without scanning and scanning in line art and text for use in publishing. Thanks again to the guys at DreamPark Development.

Our club will be holding elections for new officers in May. Prepare yourselves to run or to nominate someone for the election.

In the next 2 months most of the STUN members will have their annual membership come due. In addition, elections for club officers will be conducted in May. Serving in the club can bring personal satisfaction to the volunteer but it means much more to those in need of the club and what it offers. A nominations/membership committee will probably be calling to remind you to renew your membership and get your input on who may stand for election to the various STUN club offices.

TEAC
The Educator's Atari Club

Yearly membership fee of $25 includes 6 issues of the TEAC newsletter, the TEAC Educational 8-bit Disk Library catalog and a one year subscription to Atari Interface Magazine. For more information, contact TEAC at PO Box 1024, Laytonville, CA 95454.

SCAT SUBURBAN CHICAGO ATARIANS

AN INDEPENDENT COMPUTER USERS GROUP

SCAT (Suburban chicago Atarians)

SCAT general meetings are held on the third Saturday of each month at 10AM, unless otherwize indicated on the SCAT BBS. The location for the meeting is College of Dupage, Student Resource Center, Lambert Road between Roosevelt and butterfield Roads, Glen Ellyn, IL. SCAT is a not-for-profit computer group for the purpose of helping people better understand and utilize Atari 8 Bit/16 bit/32 bit series of computers for business and pleasure. Meetings are open to all.

Membership dues are $20 per year per family. Membership benefits include subscription to Atari Interface magazine (AIM) and special club events. SCAT and AIM are not affiliated with Atari Corp. in any way.

Anyone wishing to become a member can just come to a meeting and sign up or call SCAT's 24 Hour Bulletin board (708) 231-7227 or write SCAT, P.O. Box 72266, Roselle, IL 60172

STAG
Saginaw / Tri-City Atari User Group
"where the deer and Atarians play"
ST

The Saginaw/Tri-City Atari User Group meets the last Saturday before the 18th of the month, at 9 am, at the Rudy Zauel Memorial Library, on the corner of Center and Shattuck in Saginaw Township, Michigan. Upcoming meetings are April 13th and May 11th and June 15th, 1991.

President	Bryant LaFreniere	(517)835-2234
ST Librarian	Jim Fleming	793-9792
Treasurer/Secretary	Marty Schmidt	792-6029
8Bit Librarian	Ted Beauchamp	686-8872

Club dues are still only $20, which provides support for both the 8 Bit and ST, and full access to the club's Public Domain library, along with a year's subscription to the Atari Interface Magazine. PD disks are $3 for a double-sided disk packed full of goodies (2 for $5, what a bargain!). Check your mailing label, if you need to renew, (or haven't joined us yet!). A free PD disk is included with each new membership or renewal! DO IT NOW!

February Meeting:

We received the information for the The Atari/ Windsor show in early May (4th-5th) and it was relayed to our membership. Next meeting, the information on signing up for the GOLD card at the show will be discussed. Further information on the show can be obtained from Unicorn Publications.

Al could not attend the meeting to demo Base Two but we had an in-depth review of Superbase Personal by Bryant. Superbase Personal is a low-cost database (~$45, mail-order) that can be used for anything that a person would encounter in their home. The enhanced version (Superbase Professional 3.0) is the ultimate database in terms of cost (~$200) and features for the business or professional user. Superbase Personal is the most convenient database on the ST market for personal use (according to Bryant). There are many features in this database that are usually seen in those $100 database programs. For someone interested in a database that can do more than a mailing list program at a price under $50, this database is for you.

For the March 16th Meeting:

There isn't much to report about the March meeting, since only three people showed up. President Bryant wasn't able to attend, and substitute meeting chairman Marty Schmidt went skiing at the last minute. We therefore have no equipment volunteers yet for the April meeting.

We are trying to buy the latest version of WORDFLAIR II and have a demo ready for the April or May meeting. The program will be raffled off after the demo. As always, only current club members are eligible for the raffle.

At the May 11 meeting there will be an in-depth explanation of how one should construct ASSIGN.SYS files using GDOS and GPLUS+. We'll notify you by postcard of the finalized plans for the meetings.

SST

Sacramento ST User Group

The Sacramento ST users group supports the ST and TT family of computers and meets on the second Wednesday of every month at the Pac Bell auditorium at 2700 Watt Avenue. The meeting starts at 7p.m. with an informal beginners session with the regular meeting starting at about 7:25.

Dues are $24 a year and membership benefits include, the club's newsletter, full access to the club sponsored bbs, a free raffle ticket at every general meeting, membership disk, access to our extensive disk library for a extremely reasonable rate and a subscription to AIM.

President	Mark Warner	(916)344-1150
Vice-President	Keith Kejlvik	(916)334-6130
Treasurer	Steve Kipker	(916)661-1234
Disk Librarian	Ric Kalford	(916)723-0237
Membership	Robin Meriano	(916)332-5840
Midi Sig	David Bachman	(916)452-2105
ST-KEEP BBS	(916)339-0726	(916)729-2968

San Diego Atari Computer Enthusiasts

General Meetings are the 3rd Monday of each month at the North Park Recreation Center Social Room, 4044 Idaho Street at 7pm. ST/8-bit workshop meetings are on the 1st Thursday of each month at the North Park Adult Center, 2719 Howard Street at 7 pm. All meetings are open to the public.

Annual SDACE subscription dues are $18 which includes increased BBS access, AIM subscription, and reduced rates on the Disk of the MOnth. SDACE's address is PO Box 900076, San Diego, Ca 92190.

President	Michael Bergman	(619)558-7866
Vice President	Danny Rickey	(619)565-2179
Treasurer	Steve Dato	(619)565-2588
Sec/Newsletter Ed	Vladimir Vooss	(619)534-4593
8-Bit Coordinator	Terry Scott	
Wizop/Memberships	Steven Kiepe	(619)549-3207
BBS	24hrs, 300-2400 68MB	(619)689-815

We're BACK! SDACE has returned to AIM after a brief sabbatical to find ourselves (we're still lost). In the meantime, we have elected new officers and regenerated our membership. Atari machines are still a going concern in our community, with lots of activity as we have recently gained many first time members.

Our biggest event in March was our first ever swapmeet. It was a resounding success as the membership had the opportunity to sell/trade their unused software and hardware while stocking up on someone else's stuff! The universal sentiment was that we should consider doing this again at least semi-annually.

By the time you read this, SDACE's BBS should have E and F Mail capability. Thanks to the courteous assistance of John Eidsvoog of CodeHead fame, we have obtained some sample E-Mail MCL routines for use with the Michtron BBS v3.0 that we use on our BBS.

If you pass through the San Diego area, please stop in and pay us a visit! Our BBS is always open.

ST. Atari. Road. Runners.

THE #1 ATARI USER GROUP IN THE NEW HAVEN (CT) AREA

ST Atari RoadRunners is probably now the oldest continually running Atari user group in the state of Connecticut. The club was organized in March 1986 by one of the New Haven area Atari dealers and at that time we were strictly an ST club. As time went on, other Atari groups started to disband and we found ourselves in and among the 8-bit users.

We hold our meetings at Greater New Haven State Technical College, in North Haven, CT. Our meetings have traditionally been held on the first and third Thursday of each month. However, starting in January 1991, we will hold only one meeting per month and that will be on the third Thursday. The first meeting of the new year will be January 17th at 7PM. Hopefully, we will be in Room 307.

If you would like more information about ST.A.R.R., feel free to contact one of our officers listed below. And, do call the ST.A.R.R. BBS -- our sysop gets lonely sometimes.

Matthew Masserman	President	(203) 621-7007
Lou Demetriou	Exec VPresident	(203) 271-0452
Merrill Ross	VPfor 8-Bit Affairs	(203) 239-9403
ST.A.R.R. BBS (300 - 9600 baud)		(203) 421-486

Salinas Valley Atari Computer Enthusiasts

SVACE is the only Atari user group in the Monterey Peninsula area. There is a free disk of the month for all attendants, please bring your own disk. Dues are $12 per year and includes Atari Interface magazine. Meetings are at 7:30 P.M. on the first Tuesday of the month at the Salinas Community Center. Demonstrations and raffles are a regular part of our meetings.

SVACE can be contacted at 672 E. Romie Lane, Salinas, CA 93901. Anybody interested in Atari computers is welcome.

President	Gary Klugman	(408) 758-4894
Vice-President	Dale Meisenheimer	(408) 449-7750
Secretary/Treasurer	Charles White	(408) 449-8986
BitStream BBS		(408) 449-2150

We will have (or maybe already had) a demonstration of Spectre GCR from Jaime Gonzalez. We will continue to have interesting meetings as long as the members are will to bring things in to demonstrate. It's kind of like grownup show and tell.

Welcome new members: Herold Oberg, Rocky Arciga, and Bruce Piper. See you at the next meeting.

SWAG
SOUTHWEST WASHINGTON ATARI GROUP

The Southwest Washington Atari Group was formally created in April, 1985; prior to that, local Atari enthusiasts met on an irregular basis. The group has been holding its meetings at 6:30 p.m. on the last Sunday of the month (save July) at Clark County Fire District #5, Station 3 on 213 NE 120th, Vancouver, WA. SWAG started out with a large following of 8bit owners and as more and more members upgraded to the Atari ST, the membership has become mainly ST owners, but 8bit is still supported. Annual dues are $12 and SWAG can be contacted at PO Box 1515, Vancouver, WA 98668.

Allan Coker	President
Steve Traxler	Vice President
Gary Lentz	Sec/Tres/Librarian
Michael Calvin	Newsletter Editor

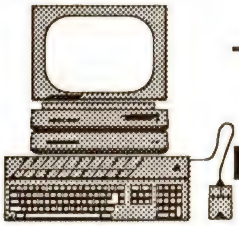
Action Annex BBS	(206) 892-8969

TACE
TINKER ACE OF OKLAHOMA

Tinker ACE of Oklahoma meets the first Saturday of each month at 1 PM (12:30 set-up time) in the Moore Public Library, 225 S. Howard, just off of SW 4th and I-35 in Moore. TACE can be contacted at 104 E. Northrup, Midwest City, OK 73110 or at the TACE BBS (405) 755-9561, 24 hrs., 3/12/2400 baud, running Oasis 4.3 software with over 60megs online storage. ST & 8bit support. Dues: Full - $20, Correspondence - $15. Dues are prorated at $1.25/month for correspondence membership and $1.66/month for full membership.

President/VP	Greg Ray	(405) 964-3765
Librarian	Chris Hamilton	
BBS Sysop	Rick Spencer	
Technical Advisor	Ron Hamilton	(405) 387-5649



THUNDER BAY ATARI ST ENTHUSIASTS

TASTE--Thunder Bay Atari ST Enthusiasts was formed in October, 1987 by a core of 5 ST owners interested in forming a user group to help each other and to help in publicising the Atari 16bit machine.

We grew fairly quickly to an all-time hig of 20 members by January, 1990. A monthly newsletter was published, and we established a PD library. Soon after, membership began to decrease -- members were getting to know their machines better, and lack of interest in publising a newsletter. We still have our PD library of about 70 disks, and will be adding to the list as we go along.

Thunder Bay is a city of 113,000 located on the norther shore of Lake Superior. We have one Atari dealer; is his also a dealer for the Amiga and IBM clones. Needless to say, the priority for Atari products is the lowest. We manage to stay alive monthly by mail order purchases -- unfortunate by necessary.

President, Neville Denetto, 185 Varsity Row, Thunder Bay, Ontario, Canada P7B 5P2.

WACO
WESTMORELAND ATARI COMPUTER ORGANIZATION

Westmoreland Atari Computer Organization meets the second Tuesday of each month in the North Huntingdon Township Town House, Center Highway and Brownstown Road (just off Route 30 near the Hamilton car dealerships, Irwin, PA) at 7:30 P.M.

Founded in December, 1983, WACO boasts huge ST and 8bit PD libraries. Double-sided disks are only $3 for members, $4 for non-members. Disk catalogs on disk are only $2. The $20 annual membership ($24 for family) now includes a subscription to AIM, as well as the vocal, consumer-oriented WACO Printout newsletter which features Z*NET. Memberships by mail are welcome.

WACO also operates the WACO Ward BBS, 300/1200 baud. The club was founded to help Atarians support each other. One of the regular features of each meeting is called "Upload" when members share new information or ask for assistance in solving questions. Both 8bit and ST disks-of-the month are demoed as well as new hardware and software.

Since the first Taricon back in 1984, WACO has been represented at most of the northeastern Atari shows as well as having a booth at all Pittsburgh shows.

WAUG

Windsor Atari Users' Group

The Windsor Atari Users' Group (W.A.U.G.), founded in 1982, is among the oldest computer clubs in North America to serve the Atari community. We are an international family of Atari owners with members from across Southwestern Ontario and the state of Michigan.

Our club meets every third Thursday from September through June with the exception of December when we meet on the second Thursday so as not to conflict with Christmas scheduling. We meet at 7:30 p.m. at the Roseville Gardens Community Centre, 6500 Roseville Garden Drive, Windsor, Ontario, CANADA.

Our club dues are $25(Canadian) per family membership. Each membership entitles you and your family to attend our regular meetings, as well as receive the AIM magazine as well as our own monthly publication, 'exSTracts'. In addition, each membership gives you access to our ever growing public domain library, packed with programming from around the world. Each club disk sells for $4.00 (Canadian) with the occassional monthly special as offered by our club librarians.

President	Brian Cassidy	(519) 966 0305

WAUG!

The Washtenaw Atari Users Group meetings are held every second Tuesday of the month at 7:30 pm in the Michigan Union building on the campus of the University of Michigan on State St. at the corner of S. University in Ann Arbor.

Club dues are $15 per year and provide access to the PD library and subscription to AIM. Meetings feature demos of both 8bit and ST software and hardware. Nonmembers and questions are welcome. Officers can be contacted by calling Craig Harvey at (313) 994-5619 or by BBS at Molin's Den at (313) 451-0524.

The February meeting of WAUG was held on Tuesday, 2/12 in the Anderson Room of the Michigan Union. President Craig Harvey announced at 7:40pm that the meeting had started at 7:30 (neat trick, Craig!) starting things off with an announcement about the "Colossal Computer Sale" that is coming up this weekend. Craig noted that he is often times informed by members that they think it would be great to have club representation at these shows, so he beat everyone to the punch by asking for volunteers to man the booth. Looks like we won't be attending this show...

Craig, with the help of Bill and Pattie Rayl, described their trip to Toronto to meet with "Denise" of Atari Canada. They had an appointment to meet with her to discuss Atari's involvement in the Atarifest but when they got there they found that Denise no longer worked there. None of the members seemed surprised by this, Atari being Atari and all that. The intrepid trio met up unexpectedly with Nathan Potechin who was a great help in getting them in the door to speak with ANYONE. The end result was that the good guys left with the impression that Atari WILL be attending the show, although there is nothing in writing. The next show planning meeting will be held on 2/16 at ADP in Ann Arbor.

Pattie described the new features of The Treasure Chest BBS. Seems they've gone multi-line at AIM headquarters, which will allow for online conferencing. Pattie also apologized that the March issue would be a little late, what with their recent trip to London.

Dave B. demonstrated Billboard, an 8-bit pic viewer that can handle most (all?) of the variety of formats in that environment. Dave showed us a pic of Lady Di, and it was a scream to watch her turn green when the XL went into ATTRACT mode.

The topic of the evening was PRINTERS. Bill discussed uses and accessories that make the HP LaserJet indispensable in their production of AIM. Bill then gave a good description of Linotron and BurmySetter hi-res printing and showed samples. Printouts of pics that had been scanned at the January general meeting were displayed showing the different quality one can expect from various printers, and since they were all printing the same picture it was a reasonable apples-to-apples comparison.

Craig announced upcoming meeting topics: March - Sound Tools and professional music production; April - X10 Home Controllers; May - Atarifest slide show, hi-speed modems; June - Elections, Swap Night.

Russ C. reviewed condition of the treasury and membership roster followed by Bill's description of the contents of the January and February AIM disks-of-the-month.

The meeting was adjourned at around 9:30, after which Bill gave an informal guided tour of the Mega STe he had brought along. This looks to be a GREAT machine, Atari FINALLY gave us real keyboards!

The March meeting of WAUG was held on 3/12 in the Anderson Room of the Michigan Union. Craig, "as advertised," called the meeting to order at precisely 7:30pm announcing that the meeting topic would be Musical Applications. Craig immediately turned to meeting over to Dave B. who led a short discussion about the AMS Player system for 8-bit systems.

Craig started an in-depth discussion of plans for the upcoming Atarifest. It seems Atari IS putting its weight behind this show, considering this show to be the official midwest regional show for '91. This acknowledgement is the proverbial shot-in-the-arm we needed to attract those vendors who have not yet formally decided whether or not to attend.

It turns out, somewhat fortuitously, that on Sunday, the second day of the show, St. Clair College will also be hosting the annual Ontario Horticultural Show which is usually well attended. While this may afford our own attendees an optional added attraction to bring the whole family to Windsor for the day, it is also quite possible that we will pick up some traffic consisting of people who might otherwise never know we had invaded Windsor at all!

Craig distributed flyers to the membership asking them to deliver them to places they travel to during the coming months. Bruce U. has been promoting the show on the CrossNet. Dave B. spoke for a few minutes about transportation logistics followed by Dan C.'s discussion of the show workforce and Gold Card plan.

There was some discussion about the structure and organization of the ST disk library. Our best laid plans to make the library available to rent has never been exercised, and so it has been exORcised. Dissolving the rental copies of the library disks will return over 100 disks to the librarian for use in ordinary library sales, thus saving the club $$$ by not having to buy blank disks at this time. Craig also announced that WAUG has officially subscribed to the new AIM 8-Bit Disk of the Month, which should help the club's lagging 8-bit disk sales.

Craig announced the upcoming meeting topics: April - X10 home controllers; May - slide show of Atarifest & discussion of high speed modems; June - officer elections/annual "flea market"

Craig introduced Jean-Michel Creviere of Pentone Productions who gave an excellent demonstration of how he uses his Mega2 in conjunction with a Sony DAT recorder to create master tapes for the production of CDs. J-M had recorded a show before a live audience and, using SoundTools (DigiDesign), he could edit the contents of the "sampled" sound and use the resulting files to produce a new tape that could be sent to a CD production facility for commercial reproduction. J-M received a round of applause for his demonstration.

Russ C. reported on the status of the club treasury and membership roster, followed by a quick Q&A session led by Craig, after which the meeting was adjourned at about 9:30pm.

WNYAUG meets at 7:30 pm on the first Thursday of each month in room 116E, Bacon Hall at the State University College of Buffalo Campus, 1300 Elmwood Ave.

Dues are $15 for new members and $12 for renewing members. Send checks and correspondance to WNYAUG, PO Box 59, Buffalo, NY 14216.

Western NY Atari Users Group, February Meeting

A funny thing happened to me while I was on the way to the WNYAUG meeting. As I was walking through the parking lot of the Buffalo State College Campus, heading toward 16 E. Bacon Hall, I happened to walk past Kevin Packard's vehicle. As I passed by, I noticed from the corner of my eye, a shiny object resting on the back seat.

Peering throug the road salt and splattered insect remains which decorated the window, I saw that the object that had caught my eye was a horseshoe. My opportunistic subconscious wondered, "Could this be the shoe that makes it possible for Kevin to win the split club jackpot all the time?"

I filed the location of the horseshoe in an obscure corner of my memory and headed for the meeting room. I sat there until 7:45, when our President, Mike Husband, called the meeting to order by announcing that WNYAUG would pick up the tab for any parking tickets our members received. So that was it! The campus police had, after two years, suddenly started enforcing the parking regulations, and there had been a scramble to move cars before they were ticketed. In the confusion that followed, Kevin had apparently forgotten his horseshoe!

This was an opportunity that could be be ignored. I sat there on the edge of my seat, taking down the minutes like a good secretary should, as the business portion of the meeting began with a discussion of the different methods of putting the contents of our old POKEY issues on disk.

Mike then called for the treasurer's report, and Dave Shane reported that our balance was $891.78. He further reported that our donation check to Robert Puff had not yet been returned. I was directed to write Mr. Puff and see if he had received our check or not.

Dave reported on his progress in getting the CHAOS addition to the WNYAUG library organized. All the self-booting disks from the utilities section are ready to go, and a new menu program was demonstrated and approved for use on those disks which do not already boot on their own menu. The motion to adopt the new menu was made by Mike and seconded by Don Koepf and carried by voice vote.

Mike then called for the secretary's report. I reported that we had a new member, Richard Ho. I then summarized the mail the group had received since the last meeting, which included various newsletters from other groups and some catalogs from Toad Computers in Severna Park, MD.

Don suggested that we contact the groups that send us their newsletters to express our appreciation. I ageed that it would ba good idea, and this will be acted upon.

WNYAUG also gained another mew member at the meeting, as Mike Cummings, alias Captain Video, attended along with his wife Debbie, and signed on for a one year hitch as a member in good standing. That capped a lively and productive business portion of the meeting and we then moved on to the program portion.

Mike H. demonstrated Turbo Basic XL, the public domain structured BASIC by Frank Ostrowski in Holland. WNYAUG was the driving force behind bringing Turbo Basci XL to the US, and we were proud to prsetn the langauge, along with documentation, compiler program and runtime veresion, on the February disk of the month. Mike also demonstrated BASIC XE, another structured BASIC for OSS, and MicroSoft BASIC, one of the earliest third-party dialects of BASIC for the Atari.

And then, finally, it was time for the split club jackpot. My trembling fingers peeled a dollar from a small wad of bills that I had drawn from my pocket. I handed the bill to Dave, and was immediately awarded with a ticket. Most of the other 14 persons in attendance also bought at least one ticket, and as Mike began to run the program that would pick a winner, I stole a furtive glance in Kevin's direction.

I saw his hand disappear behind his back. He felt for the horseshoe, and found nothing. And then his jaw dropped and his eyes widened in horrified disbelief as he realized that this time, he was going to be on an even keel with everyone else in the drawing!

Except for me. I now had the edge, because I alone knew the whereabouts of the absent horseshoe and the significance of Kevin's expression. And so it was taht when the screen displayed the winning number, it was the same number that appeared on the ticket I held in my perspiring hand.

I collected and counted my booty while a shaken Kevin Packard recovered from his shock and demonstrated his innovative technique for had disassembly of machine code, then distributed the lastest issue of The Porkard Report. As Kevin finished, the meeting broke up into several sigs.

Later, I lingered over a cup of coffee and pondered what had occurred. I hadn't thought to see if Kevin had locked his car. Should I have stolen his horseshoe? Would this have been ethical or not? And would it had made any difference in teh subsequent turn of events?

I'll guess I'll never know. But that free coffee sure tasted good, and I'll stay alert for another chance at the horseshoe. So, Kevin, if you're reading this, remember: the price of freedom is eternal vigilance.

John Kasupski

Toadfile 44 Magnum

Toad Computers, the folks who brought you the original 44MB Removable Cartridge Hard Drive, have another great deal! The Toadfile 44 Magnum. It's our famous Toadfile 44, with three removable cartridges - one filled with PD software, too! Order yours **TOADAY** and enjoy unlimited storage, high speed (25ms), and absolutely legendary support! (Choice of vegetable or garden salad.)

COOL PRICE, ONLY $849!
Standard Toadfile 44, $699!

New Atari 1040STEal!

Toad Computers has a major edge over most places selling the STE Computers. We're an **AUTHORIZED ATARI SERVICE CENTER!** That means that if there's ever a problem, **WE** can fix it. We're not some cro-magnon reseller that's going to tell you to "throw it away" if it's broken, expecting another major cash outlay. We'll even extend your warranty to **ONE FULL YEAR** for $49.95! Now that's a deal!

AUTHORIZED ATARI SERVICE CENTER

CODEHEAD SOFTWARE

The finest in productivity and utility software for the Atari ST

Announcing:

CODEKEYS

The Macro Tool!

The latest addition to CodeHead's streamlined fleet of luxury vehicles!

Automate any task on your Atari computer with CodeKeys! CodeKeys records all key and button presses and plays them back with precise timing, or as fast as possible! Use CodeKeys to assign keyboard equivalents to drop-down menus, to create a "timed save" function for any program, or to click on icons, buttons or windows! Fine-tune your macros with a flexible GEM-based editor - macros can be nested, looped, repeated, or delayed!

HOT WIRE

The Only True Alternative to the GEM Desktop!

MAXI FILE

The Ultimate File Maintenance Tool!

NEW! NEW!

LOOKIT & POPIT

Two Powerful Utilities for the Price of One!

G+plus

A Complete, Multi-Featured Replacement for Atari GDOS!

MULTI DESK

Unlimited Desk Accessories! The Revolutionary Desk Accessory Loader/Unloader.

CODEHEAD Utilities

More than a dozen unique, useful programs!

New Product Release

520/520STFM/1040ST Computers

NEW WORLD II SERIES

2/2.5/4 MEG SIMM UPGRADE BOARD

Features:

- Upgrade P.C.B. is only 3" X 4" in size. With low profile Simms installed the overall height is 3/4"
- Uses the State of the Art 8 or 9 chip Low cost 1 Meg Simm Ram modules
- All Simm Ram modules are Safety Buffered with High Speed Buffer I.C.'s
- Compared to standard 4 Meg Ram upgrades using 1 Meg Ram chips, the New World II Simm Ram upgrade has 456 Less Ram chip to socket contacts for Better overall stability
- The New World II series Simm Ram upgrade is designed around the knowledge gained in manufacturing of the New World I Ram Upgrade, one of the oldest (over 7 years) and most Stable ST Ram Upgrades Still on the market
- Complete well documented Installation Instructions and Ram Check program included
- Full Support from a Company that has been serving the Atari Community for over 8 years!
- New World II Suggested retail of $129.95 (less Simms)

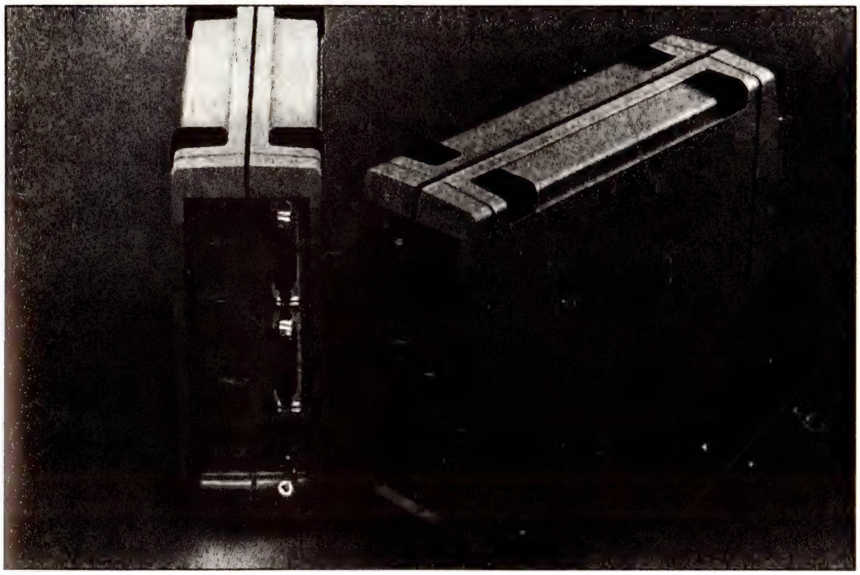
SUPERCHARGER V1.4

BREAKS THROUGH THE BARRIER

Full MS-DOS Compatability With Real Time Multi-Tasking Plus **EXPANDABILITY**



NO INTERNAL
MODIFICATIONS
REQUIRED

PLUGS DIRECTLY INTO THE
DMA PORT OF YOUR
COMPUTER

MS-DOS INCLUDED

- RUNS CGA AND HERCULES
- EQUIPPED WITH 1 MEG RAM
- USES EXISTING MOUSE AS DOS MOUSE
- SUPPORTS 5.25" OR 3.5" AS SECOND DRIVE
- PRINTS TO THE ATARI LASER FROM DOS
- SUPPORTS ALL HARD DISKS WITH AHDI DRIVER
- SUPPORTS ALL PARALLEL PRINTERS
- USES ST SERIAL PORT UP TO 9600 BAUD
- ATARI 3.5" DISK READS/WRITES AS 720K DOS
- SOCKET FOR 8087-2 CO-PROCESSOR
- USES SUPERCHARGER'S RAM AS 1 MEG RAM DISK
- USES ST'S RAM AS RAM DISK IN DOS
- RUNS 286 AND 3.0 WINDOWS
- BUILT IN BUS FOR FUTURE EXPANSION
- SEPERATE 5V DC SUPPLY
- INSTALLATION MANUAL
- 12 MONTH WARRANTY
- SHIELDED ABS CASE (FCC CLASS A CERT.)
- **ONLY 6.25 X 7.25 X 2.25 IN.**

SuperCharger - Only

$450

V1.4 Upgrade Kit - $19.95

SUPERCHARGER OPTIONS SOON TO BE RELEASED

SCplus/NET - Full networking board
- Connect DOS and TOS programs or files under Novell™ etc.
- Transfer rates of 2.5 Mbits/sec.
- Plugs into existing expansion connector with no soldering required.

SCplus/286 - Turns SuperCharger into a full 286 co-computer
- Runs at 12 MHz on a pure AT chip set
- Comes with 1 Meg of RAM expandable to 4 Meg - full EMS support
- Contains true AT expasnsion slots - accepts ANY expansion card
- Provision for an 80286 co-processor
- Plugs into existing V30 socket with no soldering required.

SCplus/386 - Turns SuperCharger into a full 386 co-computer
- Runs at 16 MHz on a pure 386 chip set
- Comes with 1 Meg of RAM expandable to 4 Meg - full EMS support
- Contains true expasnsion slots - accepts ANY expansion card
- Provision for an 80386 co-processor
- Plugs into existing V30 socket with no soldering required.

TRUE MULTI -TASKING

Connect several superchargers together to run different programs concurrently

HOT KEY

Allows TOS/DOS switching without rebooting.

TOOLBOX

Programming interface to allow programmers to develop their own background tasks.

LAUNCHER

Execute DOS programs directly from your TOS window.

High Performance.
High Resolution.

Now a low-end multimedia solution which can rival fully dedicated turnkey hardware systems.

from LEXICOR for the ATARI Computer.

This creation is hand drawn using LEXICOR'S 24-Bit Prototype type, PRISM PAINT and Graphics Tablet.

On the Cover

The Atari TT, showing off its color CAD capabilities. ISD's DynaCAD on the TT was one of many sights to see at the recent Windsor/Detroit show. Read the show report in this issue for details!

Managing Editor: Patricia Snyder-Rayl
Editor: Bill Rayl

AIM is produced with an Atari Mega/STe 4, HP Laserjet II with PacificPage Postscript cartridge and Soft-Logik's PageStream.

Atari Interface Magazine is a monthly publication that also serves as an official newsletter of several independent Atari user groups and is not affiliated with Atari Corp. in any way. AIM is published by Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108, (313) 973-8825 voice, (313) 973-9137 BBS. A subscription to AIM is included in membership in any participating club or may be obtained directly from Unicorn Publications.

AIM does not knowingly reprint copyrighted material without first obtaining permission from the source. Non-commercial user group publications are granted permission to reprint articles from this magazine as long as credit is given to AIM, the author and club (if applicable). Opinions expressed within articles in this magazine are solely the views of the author(s) and do not necessarily represent the opinions of AIM or any participating club. Atari, the Fuji symbol and names of Atari computer products are trademarks of Atari Corp.

ATARI BULLETIN BOARD

Bill & Pattie Rayl

Well, it's been awhile since we've done a "real" Bulletin Board column, and the news has been piling up!

Atari News

Atari Corp. has finally received FCC Class B certification on the Mega/STE. Earlier reports that this new machine had passed Class B—some of which came direct from Atari employees—were incorrect. The confusion caused from these reports, especially to Atari dealers, can be laid to rest because the machine is now certified for home use.

In last month's issue, Dave Plotkin mentioned Atari's new ST Notebook. Here are a few more details. The Notebook is 30 x 21 cm (approx. 11-1/2 x 8-1/4 in) in size and is about 2 inches high when closed. The little ST weights about 2.5 pounds, without hard drive or floppy.

The Notebook is planned to be sold with internal 20, 40 or 60 meg hard drive (user's choice). The screen is similar to the STacy's LCD monochrome screen, with a resolution of 640 x 400. Parallel, serial, MIDI, DMA and mouse/joystick ports are standard equipment on the Notebook, with some sort of "expansion bus" also reportedly included.

The Notebook is expected to be available, at least in Europe, by the end of 1991. No price has been announced.

Atari's other surprise showing at CeBIT in Germany was what is now being called the STylus. This "computer" takes input from a pen that touches its pressure-sensitive screen. Looked on as "the wave of the future" by some analysts, the STylus would be able to recognize handwriting input.

Computer industry giants IBM and Apple are also working on such systems. Preliminary information on the Newton, Apple Computer's entry into this market, has begun leaking out from time to time.

Details on price and availability for Atari's STylus have not yet been announced, although Sam Tramiel stated in his recent letter to stockholders that they are shooting for release by the end of this year!

STart Stops

The biggest news item for this month is that Antic has ceased publication of STart magazine. The April/May issue was the last released issue, and unless a buyer is found or other arrangements made, that will be the last issue ever to be released.

STart was the last US-based "slick" commercial magazine devoted to the Atari computer. Antic will continue to publish its new PC Home magazine for the IBM user.

In an effort to help out STart subscribers, whose subscription refunds or continuations are questionable at this time, Unicorn Publications is offering a discount trial subscription to Atari Interface. STart subscribers can get a 12-issue subscription to AIM for only $12.

A *free* ST or 8-bit disk and CompuServe Intro kit with $15 usage credit will also be included in this offer. For those STart subscribers who, for obvious reasons, don't want to go for a year's subscription, a 6-issue subscription is being offered for only $6. The 6-month subscription does not include the free disk.

To take advantage of this offer, STart subscribers must send in a check or money order, along with a recent valid mailing label from their STart magazine (or a xerox of the April/May STart disk label). All orders must be postmarked on or before August 31, 1991. Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108 (313) 973-8825.

With the passing of STart, it is probable that Antic Software will also cease ST support. (According to Antic employee Paul Lefevre, much of the Cyber software series has already been or is being ported to the IBM platform.) Unfortunately, this may leave Flash 2.0 in limbo! According to our sources, Flash 2.0 is ready for release. On CompuServe, Lexicor's Lee Seiler indicated his interest in distributing Flash 2.0. We can only hope!

Lexicor Software Ships!

Speaking of Lexicor, their long-awaited Phase 4 products have begun shipping to dealers via RIO Datel. The packages include the ROSETTA-3D animation translator/viewer, CHRONOS Key Frame Animator and PRISM PAINT drawing package.

Having seen demo versions of Prism Paint and Chronos, we have to say these are going to be extremely popular items. If you're into graphics and/or animation, the stuff is simply a "must have!"

RIO Datel, 3430 Tropicana Ave. #65, Las Vegas, NV 89121, (800) 782-9110.

Dover Research

Dover Research now has a 600 megabyte read/write optical disk drive available for the ST. The drive, which plugs in to the DMA port and is usable on any ST, STe or TT, retails for $3,495. While this wouldn't be considered low-cost by most standards, it is well over $1,000 less than the retail price of similar drives available for the IBM.

Jay Craswell of Dover also says their new color board, Albert, is available for the Mega/STE and TT. The board plugs into the VME slot, giving resolutions of 800 x 600 and 1024 x 768 with 16 out of 4,096 colors on-screen at one time. The display is non-interlaced, and therefore avoids the "flicker" problems associated with interlaced displays such as on the Amiga and some IBM VGA setups.

Lexicor's software takes advantage of the board, and Jay says PageStream also takes advantage of the color display. Retail is $799. Their ISAC color board for the Mega ST is currently being sold at a special discount price of $599.

As if that weren't enough, Jay reports that a number of new software products will be coming from his company shortly, both for the ST and IBM PC platforms. One of these products is an 8088 to 68000 assembly source cross-compiler. Dover Research, 321 W. 4th St., Jordan, MN 55352, (612) 492-3913.

Another Color Board

CyberCube Research has announced the CyReL Skyline M16-1280, a RISC-based 16 million color board for the Mega STE/TT and ST/Mega. The board plugs into the VME slot on Mega/STE or TT and has an optional ASCI interface for other STs. The board is capable of up to 1280 x 1024 resolution and sports full PAL or NTSC support for GENLOCKing! CyberCube Research, Ltd., 126 126 Grenadier Crescent, Thornhill, Ontario, Canada L4J 7V7, (416) 882-0294, FAX: (416) 886-3261.

PageStream 2.1

By the time you read this, Soft-Logik should have begun shipment of PageStream 2.1. This is a *major* upgrade to an already great DTP package. The package is supports AGFA Compugraphic's hinted outline Intellifonts (10 of these fonts are included in with PageStream 2.1). Adobe Type 1 IBM-format fonts are also supported, with the ability to output these fonts to even standard 9-pin and other non-Postscript printers!

Other enhancements include the option to load and save Tags independent from documents, the ability to easily "bleed" objects off the page, and enhanced color capabilities. Add to that the importing of GIF, ProDraw, DR2D and Aegis graphics and GEM metafiles containing text!

Retail price for PageStream 2.1 is $299.95. Soft-Logik Publishing, PO Box 290070, St. Louis, MO 63129, (800) 829-8608.

ICD 8-bit Super Blowout!

Sadly, ICD is clearing out all of its existing 8-bit inventory. The press release from ICD says "Our basic reason for this sale is that we can no longer show any profit margins for these products, nor produce any large quantities to keep in stock, but we can and will continue to support the end-users."

With discounts of over 50% on most items—from SpartaDOS X to MIOs—this may be your last chance to pick up those great ICD 8-bit products or to get replacement manuals, spare parts, etc. Since these products will be going fast, your best bet is to call ICD voice or call their BBS (you can place credit card or COD orders online!). Also, anyone interested in purchasing the rights to these products should call ICD to discuss terms. ICD, Inc., 1220 Rock St., Rockford, IL 61101, (815) 968-2228, BBS: (815) 968-2229.

TransKey Goes to DataQue

DataQue Software is now the distributor of the TransKey product for the Atari 8-bit. TransKey allows 8-bit users to connect a standard IBM keyboard to their computer. At this writing, new pricing has not been announced. DataQue Software, PO Box 134, Ontario, OH 44862.

Diamond GOS Update

The 8-bit Diamond GOS cartridge from Reevesoft has been updated. Version 3.0 features enhancements to speed up the operating system and includes a new manual and rewritten Diamond Paint (3.0) and Diamond Write (3.0). A special price of $54.95 is available for a limited time, and registered owners can upgrade for $30. Diamond News Station has also been upgraded to version 3.0 and costs $29.95 (or $5 upgrade for registered owners).

Diamond Develop, the developer's kit for Diamond, is available absolutely free to anyone who will develop a "substantial GOS application." Reevesoft, 29W150 Old Farm Lane, Warrenville, IL 60555.

GFA Software

GFA Basic and other GFA products are again available in the US. This time, GFA is directly supplying the US market, rather than going through a third-party like Michtron or Antic. A new version of GFA Basic (3.5) that takes advantage of the new machines (like the TT) is now available. Also, registered ST GFAers can take advantage of a half off deal on the MS-DOS version of GFA Basic.

Online support for GFA products has begun on CompuServe. GFA Software Technologies, 27 Congress, Salem, MA 01970, (800) 766-6432.

Universal NETwork

Developers of UIS III have introduced the Universal NETwork, a hardware independent software solution that can work with all network devices currently on the market. Universal NETwork can multi-task between network nodes, while simultaneously carrying out foreground tasks. Included with the network software are installation and configuration editing programs, programmer tools and a background file transfer utility. Price is $85 per node. A&D is also selling MIDI-net adaptors that plug into the ST's MIDI ports and allow use of ordinary phone wire to connect STs. Price is $30 per ST. A&D Software, 280 Peach Street, Merlin, OR 97532, (503) 476-0071.

CalAssistant

A great new desk accessory from Spar Systems gives detailed help to Calamus users. Using text, icons and pictures, CalAssistant gives step-by-step tips and tricks for getting the most out of the Calamus DTP package. The help "messages" are page-referenced to the original Calamus manual for those times when you might want to refer to it for more details. CalAssistant comes with tutorial .CDK files, fonts and font utilities for Calamus and more. Suggested retail is $34.95. Spar Systems, 381 Autumn Ave., Brooklyn, NY 11208, (718) 235-3169.

Rimik Enterprises

Rich Betson, formerly of Talon Technology, has started his own company and is off to a great start. Rimik's first release is Menu Plus, a "program launching system and more." Menu Plus uses a "menu tree" system for organizing sub-menus of programs, etc. Each "menu" can store over 160 programs. and Menu Plus uses only 32K of memory when other programs are running. The software also allows users to view Degas, Neochrome and Spectrum pics, view/print text files or play sound files. All this for only $39.95.

At the recent Windsor/Detroit show, Rimik was also showing MultiGEM, a German import. This software allows for true multi-tasking of GEM and TOS programs in individual windows. Reports from Germany indicate the software is solid and EXCELLENT. The software should be shipping about the time you read this. Rimik Enterprises, 836 Osborne St., Vista, CA 92084, (619) 630-1217.

Windsor Video

Those of you who missed the Windsor/Detroit International AtariFest, and those who attended, can get to see all the great products by picking up the show video. The video was produced by Dan Stidham and the crew at AAA Images, the same guys who did the excellent PACE and WAACE videos recently. See Lexicor animations, GoldLeaf's Retouche slide show presentation, Calamus SL, and lots more.

The video also has interviews with Geoff Earle, General Manager of Atari Canada, ISD's Nathan Potechin, Charles Johnson's "bathroom interview," and too much more to tell you about. Price is $19.50. AAA Images, 3809 Feather Lane, Elsmere, KY 41018, (606) 342-5660 or (606) 342-9129.

Abbreviator ST

Kyle Cordes has released Abbreviator ST, a new desk accessory that expands user-defined abbreviations as you type. This is a great little utility for automatic entry of frequently typed phrases, names, etc. Abbreviator ST can also "capture" phrases AFTER you've typed them, storing them for later use. At $19.95, this ACC can save you lots of typing time for a little money. Kyle Cordes, 3815 Greegrass Dr., Florissant, MO 63033, (314) 921-0614.

CardFile 3 and STeno/STalker

Gribnif Software is now carrying both CardFile and STeno/STalker, along with their popular NeoDesk line. Originally sold by GT Software, CardFile is an excellent address/phonebook/Rolodex utility that can keep track of appointments, print agendas, address envelope, dial the phone using a person's stored number and more. Price is $39.95.

Although not "finalized" as of this writing, Eric Rosenquist of STrata Software indicated that he was close to an agreement which would give Gribnif the world-wide distribution rights to STalker and STeno. This terminal program and file editor combo were reviewed in the August 1990 issue of Atari Interface. Gribnif Software, P.O. Box 350, Hadley, MA 01035, (413) 584-7887.

DC Desktop
The GEM desktop enhancement

"DC Desktop is a permanent part of my system!"

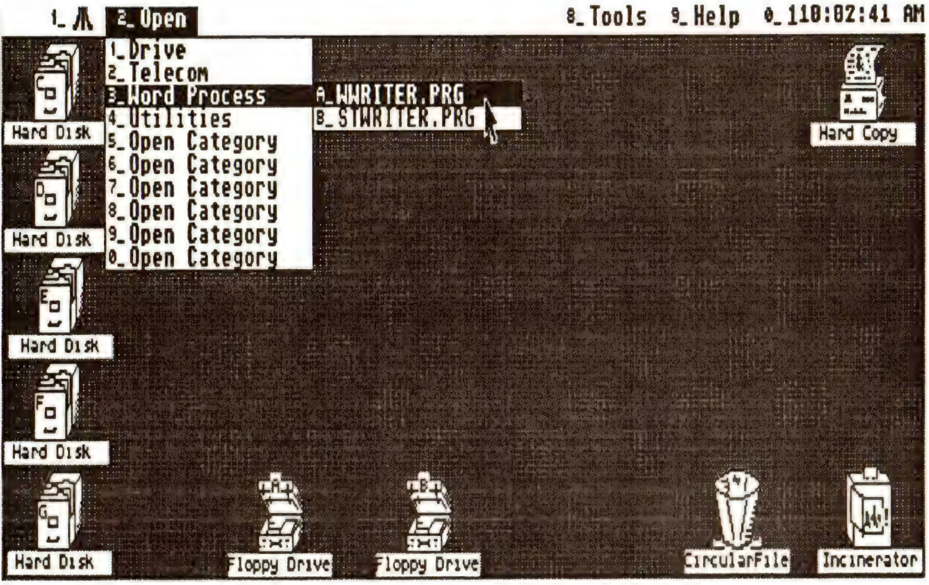
SLICCTOP

Gary Klugman (SVACE)



It is great to see something new that is really innovative for the ST. Randy Foster, programmer and president of SLICCWARE, is a talented programmer and a person with vision.

SLICCTOP is a true replacement operating system. All of GEM's dialogue boxes are replaced. The icons are changed and the menu bar across the top is different. The operating system is similar enough to GEM that ST users can use it immediately. The single most innovative feature is that it has multitasking capabilities.

Getting Started

SLICCTOP comes with manual, a couple of loose addendums and two disks. The manual is inexpensively produced, made up of light weight paper, and contains screen capture illustrations. That is forgivable for a $49.95 program. It is sadly missing an index.

The manual starts with the very basics of using your computer. In a real way, it is like a manual that would come with your computer. The writing style seems like a programmer wrote it.

Indeed, Randy Foster published it using PageStream. Sometimes, it seemed mundane, other times the explanation was too technical or too brief. Still, it gets the job done.

SLICCTOP can only be used with a hard drive, and it needs an ST with at least a megabyte of memory. The program installs itself on the hard drive when you run an install program. The installation was simplicity itself, a real model for other programs.

The process installs installs SLICCTOP.PRG and a SLICCTOP.ACC, as well as numerous invisible files. The install sequence determines whether you have TOS 1.4 or later. If you have an earlier version of TOS, the installation adds a program to you auto folder. With TOS 1.4 and later, the installation utility modifies the DESKTOP.INF.

The installation software even determines if you have two floppy disk drives. That way, you won't need to swap disks. If you are worried about SLICCTOP's invisible files or changing your DESKTOP.INF, there is no need for concern. SLICCTOP will completely remove itself from your hard drive if you want.

The new desktop will have icons for all your installed drives and partitions. When you move your mouse, the pointer flutters as it moves across the desktop. There is a resettable clock in the upper right side. You also see two "trash cans." One is the icon labeled Incinerator. The incinerator acts like the GEM trashcan. There is also the circular file. Files dragged to the circular file will be stored in a subdirectory called TRASH. These files can be restored if they were deleted by accident.

Messing with Menus

One of the most exciting features is accessed from the upper left of the menu bar. Under the item called "Open" is a drop-down menu. Here, any program can be run very quickly and easily. Also, other routine desktop procedures can be done instantly. One example is that, if you tend to go to a specific folder on a certain partition on a regular basis, it cam easily be done from this menu.

There are nine of these "auto" items on this drop down menu. Choose one of these and you are presented with another menu of up to 16 choices. The choices can be of programs you want to run or places you want to be on your hard drive. This adds up to 144 different processes that can be done from the drop-down menu.

These 144 installed processes are not automated recordings. You don't see the process of selecting a drive, then a folder, next a program, and finally running the program. The program is selected on the drop-down menu and runs from there.

Of course, programs require time to load. During this time, a spinning clock (like on a Macintosh) is displayed, instead of the busy bee. Once the program is executed, the user can terminate the program immediately and roll back to the desktop. At the desktop, normal functions can be done. The user can then roll back to the same place in the program when exited. This feature was extremely helpful in writing this review.

More than a GEM

While SLICCTOP operates similarly to GEM, it has commands of its own. For the power user, there are lots of keyboard equivalents. Although the mouse is friendlier, pressing one or two keys is much faster. To be a power user, you will have to read the manual.

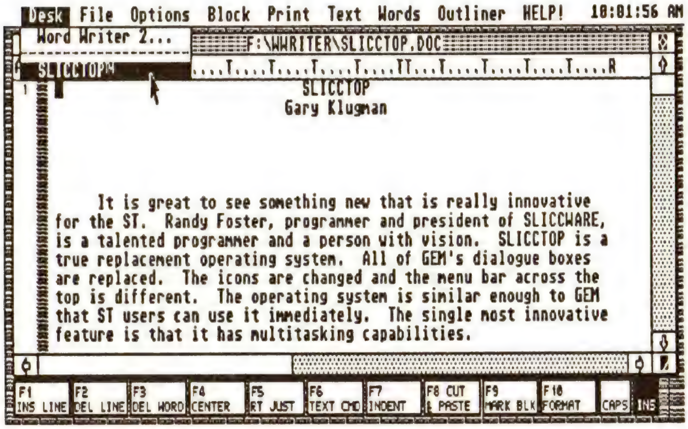
The SLICCTOP dialog boxes give the user the keyboard equivalents for mouse movements. The user can decide to keep their hands on the keyboard for speed, or use the mouse for ease.

SLICCTOP allows the user considerable control over routine tasks like disk formatting. The number of tracks and sectors can be chosen. When copying one floppy disk to another, SLICCTOP will format the destination floppy if it isn't already formated. If the destination disk already has files on it, a diskcopy can merge the files from one disk to another. The choice is made by the user before the diskcopy is done. Whole floppy disks can be erased rather than reformatting by dragging the disk icon to the incinerator. This is a much faster alternative to deleting files individually.

There is no set limit to the number of windows that can be opened!

You can even set the computer's boot delay time, so the hard disks can warm up before the computer kicks in.

Multitasking is one of the most unique things about SLICCTOP. SLICCTOP can indeed truly multitask, although multitasking is slow. I transferred files from the hard disk to a floppy from the desktop. During the transfer, I loaded TimeWorks WordWriter and edited a document. I left WordWriter, loaded Interlink and called a bulletin board.



SLICCTOP
Gary Klugman

It is great to see something new that is really innovative for the ST. Randy Foster, programmer and president of SLICCWARE, is a talented programmer and a person with vision. SLICCTOP is a true replacement operating system. All of GEM's dialogue boxes are replaced. The icons are changed and the menu bar across the top is different. The operating system is similar enough to GEM that ST users can use it immediately. The single most innovative feature is that it has multitasking capabilities.

Select CONTROL-S

CANCEL UNDO
ACCEPT RETURN/ENTER

To be spiteful, I tried to read the floppy that I was writing to. The program crashed and the hard disk rebooted. All things considered, rebooting is not the worst kind of crash.

SLICCTOP cannot multitask programs that take over the operating system. Therefore, most popular programs will not multitask. One cannot be using WordWriter and their telecommunications program at the same time. The user can multitask desktop routines, like moving files, while running their favorite program. Still, if a program was opened using SLICCTOP, you can exit the program at any point and "roll over" to the desktop. Once at the desktop, files can be moved and house-keeping chores can be done. Then, at any time, you can roll back to the original application.

True multitasking has been a goal for ST users for a long time. We are the last of the 16-bit computers to get it. Randy said the hardware is not amiable to multitasking. The limited multitasking that SLICCTOP allows is in one word, slow. Keyboard response time can be slowed down as it competes for processor time.

Many of things that we would like to do in a multitasking environment cannot be done with SLICCTOP. Running two applications can only be done by programs specifically written for SLICCTOP.

Randy Foster is planning to publish applications that will multitask using SLICCTOP. In the works is a word processor, editor and telecommunication program. These programs and other utilities will be made available to registered users directly from SLICCWARE. By selling direct, costs can be kept down. Plans are to sell these programs and utilities in the range of $10 to $25.

Since backup is an important thing to all hard disk users, SLICCTOP has a powerful backup utility. There is a great amount of powerful flexibility built in. The user can backup by directories, by the last time things were backed up, or simply backup everything. All backups can be done from one point on the hard drive to another, as well as from the hard drive to a floppy.

Randy Foster spent two years developing SLICCTOP, and he is dedicated to supporting it. He is readily available by phone for questions. I called him just after he sent out a free update. He had just discovered that the update had a bug in it, and he was tremendously disturbed by this. He was in the process of sending out a corrected version within 48 hours. He was also planning on calling as many registered users as he had phone numbers for. Not bad for a program that retails for under $50. I felt that he considers this program to be his baby, and above all, he wants it right.

Finally

I like SLICCTOP. As I continue to use it, I see the thought that went into its development. I will continue to automatically boot into SLICCTOP after this review.

The average ST user can get along fine with the GEM interface. However, if you want to exercise more control over your ST and you like having the alternative of keyboard equivalents for mouse movements, SLICCTOP is for you. If you think multitasking is "sexy" then SLICCTOP is your only choice in desktop replacements.

The Best $19.95 You'll Ever Spend.

Don't throw your time away typing words and phrases over, over, and over again.

Abbreviator ST automatically expands your abbreviations to their full length. Unlimited number of abbreviations, each up to 240 characters long. No added keystrokes, a SIMPLE to use desk acc. For example: *da* becomes *desk accessory*
wp becomes *word processor*

You Choose The Abbreviation.
You Choose What It Stands For.

Abbreviator ST cost $19.95, we'll pay the postage. Write:

SEND FOR CATALOG

The **Juggler** $49.95

Working with several applications at once can be a juggling act - and all too often it's an awkward exercise that requires patience and practice just to keep moving! The Juggler has perfected the art of smooth transitions between several applications.

Utilities Plus $59.95

Some of MichTron's most useful programs: *MichTron Utilities* - helps keep control of your Atari ST files, *DOS Shell* - emulates the popular MS-DOS commands used by all IBM compatible computers, *M-Disk Plus* - a RAM disk and printer spooler, *STuff* - a package of 21 different utility programs for all ST users and *Super Directory* - makes filing and organizing your disk files fast and simple.

Hard Drive
Turbo Kit $59.95

In this three-in-one package you will have all the utilities necessary to keep your machine running at its peak speed and efficiency.

- Backup your hard disk to floppy disks.
- Restore your files from the backup after an accident, or anytime.
- Select whether to backup hidden files and/or system files.
- Rewrite your files to contiguous blocks on the hard disk to speed up the time it takes to access files.
- Hold recently accessed disk sectors in your computer's memory, allowing quick and easy re-accessing of these sectors.

ATARI

1991 Shareholders Meeting

John Pilge

According to the bylaws of Atari Corporation, a meeting is held once a year to elect a board of directors and to vote on major changes in the company.

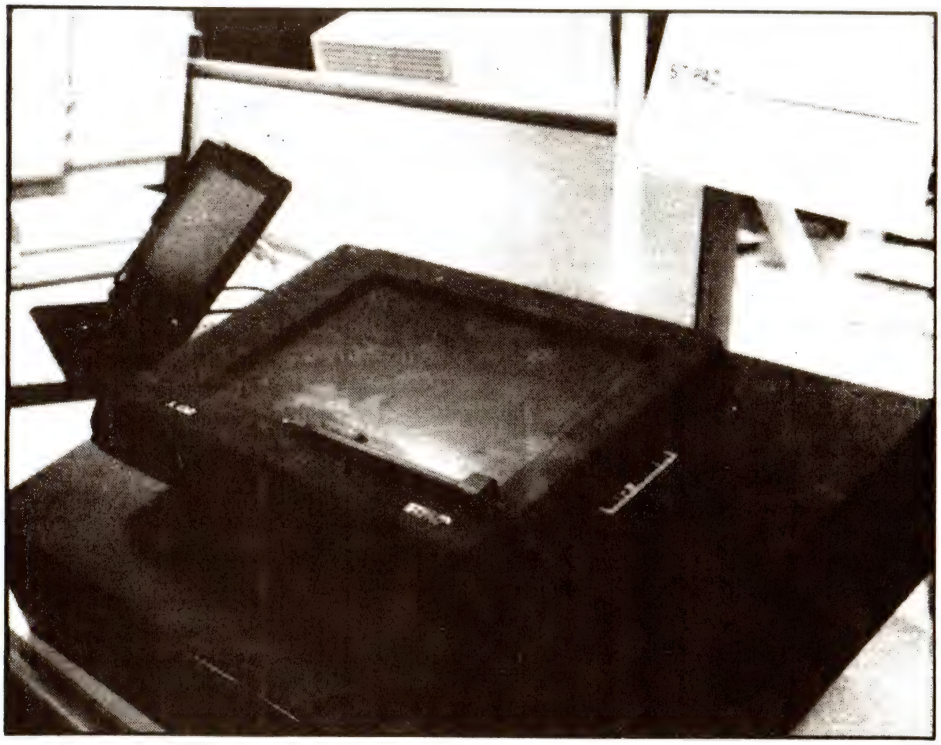
Every April a notice is mailed to all shareholders to send in a proxy statement to vote on the directors and other matters. The results of the vote is announced at the meeting in May.

There are no surprises. The choice of directors run unopposed and the vote is understandably predictable. The board members hold 51 percent and Time-Warner owns about 24 percent of the stock.

Most of the attending shareholders are friends and employees (Atari has a stock purchase plan for employees).

At the May 14th meeting of Atari shareholders, the voting results were announced and the meeting was over. That is the official part of the shareholders meeting. It is over in minutes.

The rest of the meeting is where Atari does a "show and tell" of products and answers questions. The TT, STe, Lynx and Portfolio were on display.



The STacy will be available in a more compact form that will be 8.5" x 11" when folded. It will be called the ST Notebook. The current plan includes a hard disk and hopes of a battery life of perhaps six hours. For a portable with a hard disk, that is exceptional.

The ST Pad will be called the STylus. It will not have a keyboard. It will use a type of light pen. Both products are expected to be out by the end of 1991.

The big news in software for the TT is Retouche Professional by 3K Computerbild in Germany. Soon to be available in the USA from Goldleaf, it allows users to do digital retouching of photographs. (You would, of course, need a scanner and laser printer.)

The XE is still in production. Currently, it is being sold in South America, Eastern Europe and the Middle East.

There are no plans to bring the Atari line of 386 MS-DOS computers to the United States.

According to the Atari annual report, Atari made over $14 million in 1990 on sales of $411 million which works out to about 11 cents a share. Europe accounted for 86 percent of sales by Atari with the USA bringing in 11 percent.

Sam Tramiel reports in the annual report "the Atari 2600 and 7800 continue to sell well in Europe" and are slow sellers in North America. Also, in Sam Tramiel's message in the Atari annual report is, "New table top video game consoles are planned for introduction in 1992."

Sam would not comment further on this, when asked about it at the shareholders meeting.

The entire event lasted less than one hour.

The Windsor/Detroit International AtariFest A Great Show for Seeing All the New Goodies!

Dan Stidham

Courtesy of ST-Report

St. Clair Community College in Windsor, Ontario was the site of the first ever international Atarifest co-ordinated by user groups from different countries—The Windsor Atari User Group and the Washtenaw Atari User Group. Official show direction was provided by Brian Cassidy of the Windsor group and Craig Harvey of the Washtenaw group (who also happens to be the author of an excellent editing/hacking utility called EdHak).

NO SMOKING
NO SMOKING
GramSlam
ATARI

Key promotional assistance for the show was provided by Bill and Pattie Rayl of Atari Interface magazine. From reading online posts and speaking with the Rayls personally, this show was one of the most thoroughly promoted Atari events in memory.

Promotion tools were diverse and included advertisements in the Detroit Free Press, Windsor Star, Ann Arbor News and several other local papers. According to Bill Rayl, the newspaper ads ran for a month prior to the show at a cost of over 1,000 dollars. Detroit and Windsor area stations ran a special ad on network-affiliated TV stations (as a public service) and a local cable station ran a half-hour show dedicated to the Atari line of computers and the upcoming show every night for a week prior to the show.

Over 200 copies of a show kit were sent out to various user groups in the Midwest, New York and Canada. Ads or announcements were also run in national ST publications such as Atari Interface and ST Informer, with press releases sent to ST Journal, Current Notes, STart and Atari Explorer.

Personally, I felt the facilities (taking into account that it wasn't held in a hotel convention center) were top-notch, the best I have seen. A large, colorful Atari banner hung over an information table where tickets were being sold near the entrance of the main lobby for the college. After buying your ticket for four dollars (US or CND), you went down a long hallway, made a right then a left, passed by a small concession area and entered the double doors of a huge gymnasium.

The booths were set up around

Darek Mihocka and Atari Canada's Rob McGowan

the perimeter of the gymnasium with three island strips in the middle of the floor. There was plenty of room to walk around, even if the show-goers were two or three deep in front of booths. The booths were professionally set-up with blue curtains used over a booth frame.

Atari was there with a double wide, double deep booth displaying all of their latest hardware including the TT030, the 1040STe and the Mega STe, Portfolio and the incredibly good-looking and sleek SLM605 laser printer.

Their booth was back-to-back with a large Atari dealer out of Toronto, Canada called Savetech, whom Atari Canada had supplied with an inventory that would make a red-blooded American STer turn green with envy. Large stacks of hardware in boxes made up the bulk of a pretty impressive display. And just what was in them thar boxes? TT030/2/50s, Mega STe 4/50s, 520STfms with SC1224 monitors, Megafiles, 1040 STEs and Stacy 2 with 20 meg hard drives.

Savetech took out a large ad in a local Windsor paper detailing the inventory they would have at the Windsor show. The ad was very professional-looking and included pictures of the "TT030 Graphics Workstation," the Mega STe, etc. The prices were even more impressive, the likes of which I will get into later in this article. (My Windsor video has some thorough footage of the Savetech booth and a close-up shot of the ad they ran.) *[Ed: See the Atari Bulletin Board article for details on this video.]*

The dynamic duo of Atari/Savetech was positioned strategically—smack dab in the middle of the floor—and made up the entirety of a large, squarish middle island.

Canadian Customs...Quite a Tradition, eh?

Many exhibitors took advantage of a generous offer by Atari Canada to provide loaner machines to avoid the hassle of bringing their equipment across the border, and a hassle it was. I produced a video for the show and brought along lots of video gear. My assistant, Scott Haynes, brought along an Atari Mega ST2, hard drive and monitor. The Customs people stopped us for about an hour as they suspiciously checked over all of our equipment.

I knew we were in trouble when the customs agent saw the Atari logo and commented, "What's wrong with Amiga, eh? Why don't you have an Amiga, eh?" Scrambling to stay under the good graces of this apparently brain-washed bureaucrat, I groveled unashamedly and said, "Geez, that's funny you should mention that because I am into video and I was just telling my friend here (Scott), how I wish the Atari would come up with some good GENLOCKing hardware and software to go along with their new genlocking and graphics capabilities, and how if I had an Amiga I could do all my video-editing on the computer ala Desktop Video."

Dropping my head in betrayed disgust, the Customs agent looked at me pitifully while I shook my head. Moved with compassion for a fellow bytemeister who apparently had not seen the light and was suffering for the error of his ways, the Yogi-bear-looking agent, folding his arms and leaning back on the car parked next to ours, took a deeply reflective breath, and proceeded to elucidate mercilessly and smugly on the perfectness and completeness of his Amiga world.

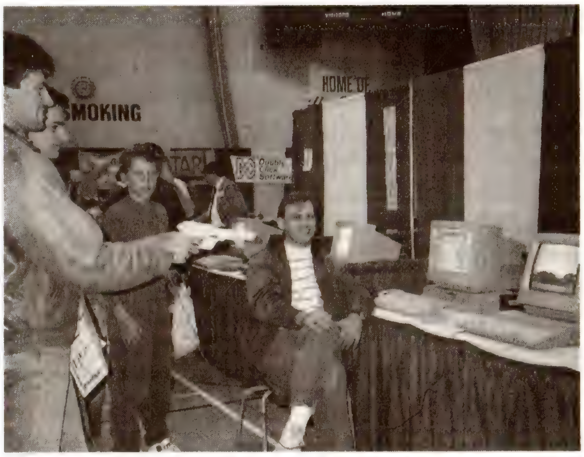
He detailed how he was using the Amiga in his organic chemical business to make brochures (yes, the guy was a self-taught organic chemical marketing mavin). After about 10 to 15 minutes of contrived amaze-

Dave Small demoing the new SST Board

John Fox of Goldleaf

ment (using such expressions as, "No!? Really" and "Something Else!") the Customs agent seemed satisfied that he had put us in our pitiful, slime-pit place and let us go. By the way, he mentioned that all of the Customs agents used Amigas (which is probably why many Atarians experienced hassles crossing over).

Early commitments to the show were slow coming in. But, the event gathered a lot of steam and snowballed the last couple of months (how's that for mixing metaphors?), with over 36 vendors exhibiting. These exhibitors included Gadgets by Small, CodeHead Software, Double Click, Gribnif, DA Brumleve, Goldleaf, ICD, Branch Always, MegaType, MS Designs, Nice and Software, Rimik Enterprises, SKWare One, Wiz Works & Dr. Bob, C-HQ, Unicorn Publications, Taylor Ridge, Phil Comeau, Intrinsic Software, Music Code and user groups and dealers (there was plenty of competition).



Rich Betson demos his lightgun game

Having said all of the above, there are not a lot of excuses to make for an honestly disappointing turnout. Everything was done up right and all the right people came to this party. Great facilities, unprecedented advertising, major developers, fanatical ST users—it should all add up to 2-3 deep in front of booths. As it turned out, I had very little trouble getting good shots with my camera and experienced very few incidents where a giant blob would fill my viewfinder.

Maybe the only legitimate excuse is there ain't that many of us fanatical users out there. But then again maybe there were those, state-side, who felt there would be too much trouble crossing over; this may be a good possibility but still an excuse.

Nevertheless, despite the fairly low turnout, the per capita sales of nearly all the developers I spoke with were very satisfactory. Myself, I had a great time, as I always do when I get to meet up with fellow ST users and developers. So my verdict: It may have been a disappointing turnout, but, if you turned out, it wasn't disappointing.

Final attendance has been estimated from between 800 to 1200 for the two-day show. I definitely have to go with the latter number. There were approximately 500 people attending Saturday and 700 on Sunday.

Moving on, one discovered many new products and upgrades as one went from booth to booth:

Atari Corp.

On hand from Atari US was Bob Brodie, US Manager of User Group Services. Representing the Canadian side was Geoff Earle, President and GM, Rob McGowan, Product Manager, and Mark Campbell, Asst. Product Manager.

This group of Atari payrollees underscored the downright friendliness and approachability of Atari's corporate staff. They jumped right into the crowd, discussing Atari's marketing plans and products. They genuinely seemed to be having a good time and were very upbeat about the product line in their booth. This included the TT, the Mega STe, the highly successful Portfolio and an incredibly good-looking and *quiet* SLM605 laser printer that was hooked up to the TT running Calamus. That setup was constantly cranking out some incredible-looking documents.

Also on display in the booth was the STacy 2 with 20 meg hard drive and a 1040 STe running some colorful demos. Geoff Earle also revealed during his video interview a price reduction, announced shortly before the show, of the 1040 STe to $499 Canadian from a previous price of $695. I understood, but could not con-

EdHak

Clear
Thinking

Craig Harvey, author of EdHak

firm, that Atari US has also reduced the price on the 1040 STe to $399.

Branch Always

If there was any doubt as to Darek Mihocka's continued commitment to the Atari platform, it was completely obliterated at this show. Darek was demoing an upcoming release of Quick ST 3.0 that he billed (and proved) as being even faster that the present release of 2.2.

Q-ST 3 will feature acceleration of line A functions and even faster GEM functions, impacting the speed of some DTP applications. But this just scratches the surface. Quick ST 3.0, which will be commercially released at the Vancouver Atari Festival, will feature even more customization options including customized fonts and desktop icons with the font and icon editor built-in.

Background picture customization, which has always been an integral part of Q-ST, will now allow Prism Paint format (Lexicor's paint program) and (surprise) Windows 3 files, besides the standard Degas and Neo pics. You will now be able to download all of those great Windows pics from GEnie or your favorite BBS and use them as your desktop picture.

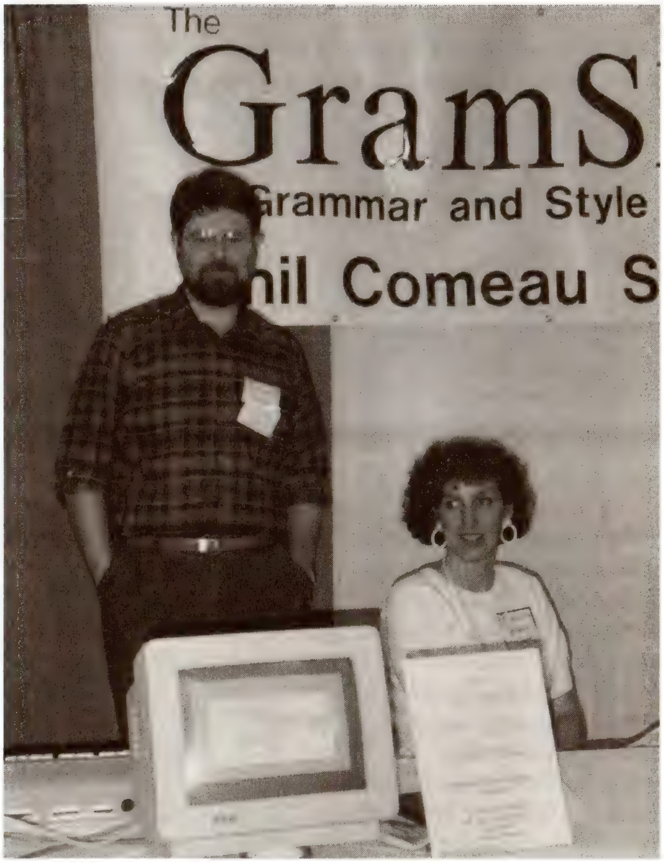
Q-ST 3.0 will also allow background pictures (with samples on the disk) for every TT resolution including 1280 by 960, the latter requiring about 150K. Darek told me Chet Walters and the guys from Wiz Works are going to help him find some nice IMG's for that rez to include on the disk.

The new version of Quick View that will come with Q-ST 3.0 allows viewing of all these pics and if you decide, "Yeah, thats the one..", all you'll have to do is press a toggle key and it will instantly become your new background. If that wasn't enough customization, you will now be able to customize everything for individual programs, Darek states in his BraSoft newsletter (which he was giving away at the show), "...if you like to use one font with ST Word and another with Flash! Or, have a custom desktop pic with PageStream but another one with Word Up, so be it..."

Believe it or not, I have saved the most impressive for last. Darek showed me a new version of MonSTEr that will allow emulation of any TT resolution on any ST screen! I saw it in action and it was operating very smoothly. MonSTEr will also allow the user to customize his virtual screen to any matrix the user wishes (for instance, say, 700 by 700) up to a certain yet-to-be-determined limit. I personally feel that this version of MonSTEr could sell all by itself for Quick ST 3.0's new price of $34.95 list but, wonder of wonders, in the tradition of power without the MAC price, Darek is bundling it with Q-ST 3.0.

C-HQ

C-HQ stands for Command HeadQuarters, and if any of you were at the WAACE show last year, these were the fellas helping work the WizWorks booth.



Phil and Vicki Comeau

C-HQ had on display its full line of in-house artist-rendered and superbly scanned IMG and Degas clipart disks. C-HQ was also selling disks of customized NeoDesk and DC Desktop Icons with over 1200 icons included on one disk! Each of around ten clipart disks had a special theme and were selling for a ridiculously low price of $10. I don't know if this was a show price or not, but the quality for the price should have been too good to pass up (guess who forgot to buy a couple in the midst of taking notes and asking questions?) for anyone who does DTP.

Clear Thinking

Craig Harvey, president of Waug in Washtenaw, MI, one of the sponsoring user-groups of this show, is the author of the popular editing/hacking utility EdHak, previously available as shareware from various online services. While interviewing Craig at his booth to gather info for this article, I was so impressed with EdHak's functionality and practicality that I purchased a copy, as did my video assistant Scott Haynes.

EdHak 2.13 can be run as either an ACC or PRG by simply changing the file extender, and is packed full of features that can accessed from a drop down menu within the file window or with keyboard equivalents. I found some of its more useful features in Edit mode (as opposed to Hak mode which can be entered via an ALT-T toggle) to be the ability to append and merge files on-the-fly within the editing window.

TARI
Double Click Software

Michael Vederman of Double Click

Are you keeping a running account of something or keeping a diary? EdHak features an autoload feature that will, upon boot-up (if EdHak is installed as an accessory) or when the program is run from the desktop, automatically load in a text file (your diary for instance). Further enhancing its diary usefulness is the ability to append, auto-stamp dates (in any format you wish) and encrypt files. Other features include launching of programs (PRG not TOS), word-wrap, search and replace, block cut and paste and text macros.

Entering Hak mode is as easy as pressing ALT-T (T for toggle as Craig explained). In this mode, EdHak acts as a very versatile disk sector or RAM editor. There's lots more but suffice it to say, in Craig's own words, "EdHak is the ST DA and PRG that is there when you need to edit anything." I guess you could expect to pay a pretty fair price if you were purchasing this great little utility for one of the other platforms, but Craig was offering it for an unbelievable $15 show price (US) with a regular retail of $18.95.

I own STeno and am now using it to compile this report (I haven't had a chance to install EdHak yet), but I would have to say EdHak is the best text editor available at its price. By the way, the documentation is excellent and features a keyboard command summary which can be separated from the rest of the manual.

Hold on just a minute, Craig was also demoing this strange little program called MetaPsychology that offered a tutorial and quizzes that offered a pretty sophisticated examination of one's psyche. Word has it that Craig is going to link this program with EdHak and allow you to edit your head if you want! Amazing! Anyway this GEM-driven program was pretty popular at $9 US and sold, according to Craig, fourteen copies on Saturday. What a curious lot, them thar STers.

CodeHead

Besides giving me one of the most memorable moments I have ever had (buy the video!), Charles Johnson was on-hand with John Eidsvoog. The CodeHeads were demoing, along with HotWire and CodeKeys, their latest upgrade to Maxifile, version 3.0. Its list of features is quite long. The upgrade features a unique scroll box, allowing one to scroll through source and destination files simultaneously. Charles told me that this upgrade is so complete and thoroughly packed with features, many of which were requested by Maxifile users, that Codehead, so far, hasn't received any further suggestions in the box.

DA Brumleve

Dorothy Brumleve was again the favorite attraction for those little bit-meisters as her booth offered a chance to try out her colorful and easy-to-use Kidprgs. Dorothy had two 1040STEs set-up, each one running either KidPublisher, KidPainter, KidGrid or Telegram; the latter being the most recent release, fall of 1990 at the WAACE show. Dorothy had one of the more interesting table displays at the show. All four of her programs were slotted into a staircase display made up of large, colorful pre-school Duplo blocks.

Dot reported that on Sunday she actually sold a couple of ST systems to parents who had been contemplating a system for the family and were impressed with the entertaining and educational Kidprgs. Dot promptly and personally escorted them over to the Savetech booth in the middle of the floor where they made their first-ever ST purchase. Way to go Dot!

Double Click

Demoing DC Desktop, DC Shower and other offerings in a quiet little corner booth were them Texas boys, Mike Vederman and Paul Lee. I was really impressed with Paul Lee's new-found Canadian accent. Seems like this guy readily adapts to regional flavors and reminds me of Woody Allen's ZELIG. Anyway, explaining to me that DC Shower was not an X-10 type of controller for all your bathroom plumbing, Paul demonstrated that, when installed in an auto folder, DC Shower enables you to view ANYTHING from the desktop, just by double-clicking on it. Anything includes ARC files, all kinds of picture formats and text files.

UIS 3.3 can now incorporate the functionality of DC Shower from its own Show selection. This gives users who have UIS installed as a DA the ability to view the above files within any GEM program.

Gadgets By Small

The focus of this booth was definitely on the 68030 SST accelerator board that is very close to release. According to Dave Small, waiting on PC boards from the manufacturers is the only thing holding up its release. "Specializing in speed and compatibility," Gadgets has tried to walk a delicate balance of speed and software compatibility as they developed and tested out this unit. Initial testing has proven successful and although I cannot give a compatibility list, we can be sure that Gadgets By Small is obsessed—as though it were their mission from God—to make sure your favorite programs run (witness Spectre GCR). Atari reports that 80% of its existing ST software library runs on the TT, so you'll get at least that kind of harmony from the SST. Coupled with Gadgets "fixes" to tune up lots more compatibility problems, the SST should surpass the TT for compatibility with ST software.

To try and give even a brief overview of the engineering genius that went into this product would cover many more paragraphs than appropriate for this report. Gleaning the excellent article in Gadgets own promotional literature Dave passed out at the show, one discovers that speeding up memory access by allowing you to upgrade your Mega 4 with up to 8 megs of fastRAM (for a 12 meg total) is the theoretical basis on which Dave has approached the design of his accelerator. Dave is providing some fastRAM utilities that run transparently from the AUTO folder, ensuring the loading of your programs into fastRAM. A coprocessor socket is also included for a 68881/2 floating point chip, with the chip coming standard with the 33 MHZ SST.

Dave has also taken a modular approach to marketing and packaging the SST, allowing the user to determine his entry point and upgrade path. For instance, if you (or your pocketbook) are satisfied with a 16 MHZ 68030 SST, you can start there and upgrade in the future. This approach will also allow users to buy their own chips in case they can get them cheaper.

Goldleaf

Goldleaf Publishing was demoing WordFlair II, the front end to their great new line of products which they are now marketing under the "Direct to Press" banner. Although they did not have ReTouche Professional running, they did have an absolutely beautiful slide-show running that demonstrated the fruits of its incredible drawing and photo retouching capabilities. I started to videotape just a few of the pics and was so awed that I kept the camera rolling and captured the whole demo on the show tape.

Goldleaf was also demoing ProFlight on a TT. Imported from Europe, it is a simulator so realistic that it has a high degree of instructional potential.

It seems Goldleaf is executing a very organized game plan to become one of the major publishers and distributors of high-end software in the USA.

Gribnif

Gribnif, as always, was one of the more popular booths with many show-goers taking advantage of the ability to upgrade on the fly. Rick Flashman and Tricia Metcalf were demoing Neodesk 3.0, the up-and-coming upgrade to the NeoDesk CLI and CardFile 3.0. Gribnif bought the rights to this indispensable schedule and address accessory, added a few things and wrote a nifty manual.

Major NeoDesk CLI upgrade features include a configurable, scrollable history (very powerful implementation) and the ability to write batch files that will allow the use of the mouse to choose selections in a menu.

I think Gribnif was quite surprised that several show-goers brought colaware payments to the booth for their popular FormDoIt dialog box customizer. I hope they had room to bring back all those twelve packs!

ICD

Jeff Williams, ICD's new public relations officer, was on-hand with another very friendly fellow (don't shoot me, I forgot to write his name down!), meeting show-goers, selling host adapters and accessories, and showing off the ICD FAST tape back-up unit. The tape back-up unit was selling for a show special $849.

Intrinsic

Intrinsic Software from Toronto, Canada, was demoing and selling a very solid command line interpreter, called (what else?) Command! The program is complete in its features, and is able to run as either a DA or a program. Regular price on this is $24.95, while Intrinsic offered a show special of just $19.95.

ISD Marketing

Seen throughout the show roaming the floor, "harassing" fellow vendors and demoing DynaCadd and Calamus was Nathan Potechin, president of ISD Marketing. Mario Georgiou from ISD was also there demoing the new, soon to be released version of Calamus SL, showing off its color capabilities. To be honest with you, I was probably more fascinated by this guy's great french accent than anything else.

JMG Software

George Geczy of JMG Software presented HyperLINK to the public for the very first time at the show. HyperLINK brings to the ST all the capabilities of Hypertext on the Mac.

MegaType

Don Turnock was demoing and selling his Fontverter program as well as two excellent imports called Font Designer and Font Designer Plus. The latter will create and edit Type 1 Adobe fonts with hinting, while the former allows for Type 3 font creation.

Don also had available a great little utility called Type 1 Converter that allows one to load in an industry standard type 1 font and export it into .ECF (font Designer Format) for subsequent conversion and export for use in an ST PostScript application.

Font Designer was selling for $95, Font Designer Plus for $175, FontVerter for $45 and the Type 1 Converter for $35. Seems like MegaType is quite a 1-stop source for all Calamus and PageStream font editors and aficionados!

One note: MegaType was also carrying the Safari product line—fonts and EPS clipart—from Computer Safari in Woodland, CA. I took advantage of a tremendous offer on the huge Clipables EPS clipart selection. Selling normally for $125, MegaType had it on sale for $85. This collection contains over 600 illustrations in a variety of themes. Every graphic is depicted by classification and references to its disk number are in the catalogue. The catalogue was originally meant for the Mac, but applies equally well to the ST version which Computer Safari has licensed from C.A.R. Publishing, taking all the hassle of ST conversion into their own hands.

MS Designs

MS Designs had a booth next to MegaType and was displaying a line of fonts for both Calamus and PageStream. Most of the fonts were display fonts and all ten groups of display fonts sold for a show special $160.00. MS also had two clipart value packages containing IMG clipart at a show special $10.00 (regular price, $20.00).

MusicCode

MusicCode was displaying a critically-praised voice development system along with a program of a entirely different color, BlackJack 3. This program boasted the capability to teach casino-style blackjack and promises to enhance your performance. (Wonder if that means you'll play with style while you are losing money or you'll win with a wild-eyed, crazed look?) BlackJack 3 was selling for $59.95 and had a beautiful and complete screen display (see it in the video!).

Nice & Software

Nice & Software pulled no punches with their display, simulating a point of sale terminal (two of them) made up of the ST and monitor running the Cricit integrated Cash Register and Inventory Control package. Called the Cricit Bar Code Plus System, Nice and Software boasted that you could own this complete system for the price of a cash register (minus bar-code hardware).

The Cricit system allows for bar-code reading directly from packaging, customized receipts, mailing lists, periodic reports, lay away searching, auto-discounting, stock searches, issuance of coupons, ability to network up to six cash registers and more. This system is incredibly easy to use and so much fun playing around with that you want to start up a retail business just so you can use this software (OK, I got carried away). Questioning Igor Tertysznyj (hey! isn't it illegal to string that many consonants together?), he revealed that there are over 500 Cricit systems installed worldwide.

Nice & Software now also carries a neat little box called the DMA switcher. Among other functions, this piece of hardware lets you turn your SLM laser printer off if it's not in use. Four DMA devices or four computers can be hooked up to the A/B/C/D ports depending on whether you want to network one device to four computers or four devices to one computer.

N&S was also showing its Lantech 10 megabit local area network cartridge, boasting 10 times the speed of SGSnet, which uses the MIDI port to accomplish its networking. On its show flyer Nice claimed that Lantech can transfer a 400K file in 17 seconds as compared to SGS's 2 minutes and 45 seconds. Selling for $179 per node, Igor Tertysznyj informed me that the UIS Net software was actually developed on a Lantech and works quite well with it.

Phil Comeau

Phil's GramSlam software was being demo'ed and claims to check for over 1200 common grammar and writing-style problems. It works in conjunction with all word processors and text editors and even checks for spacing problems, unbalanced parentheses, double words, incorrect abbreviations, and obnoxious spiels (just kidding).

Phil was also demoing TreeSaver ("Save a Tree Today"). TreeSaver claims to work with most dot matrix, ink jet and laser printers. One nice feature is its ability to run either as a DA or from the desktop as a program. A look at Phil's sample printout reveals one of its biggest departures from the ever-popular Double-Page Printer IV by Doug Wheeler. Whereas Doug's program prints two pages side-by-side in landscape mode, TreeSaver prints with a portrait orientation. TreeSaver was selling for $24.95 CND; GramSlam for $39.95 CND.

Rimik Enterprises

Richard Betson, formerly of Talon Technology, has gone out on his own and was present at the show showing some interesting products. Richard had one computer running MultiGEM, a multi-tasking product from Europe that seems to use the desk accessory slots to load in six independent programs. MultiGEM allows the user to adjust and allocate memory used by programs, even those who like to claim all the memory to themselves and claims the ability to run TOS-based programs.

After having some initial problems getting the program set up, I later came by the booth and noticed it running, seemingly without a hitch. Retailing for $99.95, MultiGEM will work with STs and STEs running TOS 1.2 or higher. Richard stated that the active window of the six programs being multi-tasked receives priority, but emphasized that processing still occurs in all other programs.

Richard also had an interface attached to an ST color system employing the light gun used by the 8-bit machines. Several kids and adults were shooting skeet out of the air with it (similar to DuckHunt). Richard promised that the ST light gun would be out on the market very soon and come bundled with the skeet game.

Also being displayed was the Menu Plus program launcher and DT Paint, an accessory pant program for DTPers.

Savetech

For Americans at the show, the Savetech booth was like a window into a totally different world. Easily the largest booth in the show, Savetech featured stacks and stacks of Atari product for sale to the general public that can be obtained only from VARs in the states, let alone in the middle of an exhibition hall.

TT030/4 with 50 meg hard drives were stacked in a display 20 boxes high and were being blown out at $2300 CND by show's end. The exchange rate being 13:10 on that day, this translated into approximately $1800 US. Stacy 2s with 20 meg hard drives were being offered for $1350 CND (about $1,000 US). Mega STEs were available on the first day of the show for $1,900 CND and dropped another $300 CND on Sunday (approximately 1200 US). Portfolios could be had for $250 CND, 520STfms with color monitors for $450 CND, and 1040 STEs for $440 CND. How 'bout (pronounced boat in Canada) the archaic little SX212 1200 baud modems selling for $20 CND?

SKWare One

One of the first products I wanted to see upon arrival was SKWare One's ColorScan program. Even though I was disappointed that this nifty little program didn't do what I was dreaming of (true reproductions of color from scanned image), I was still impressed with the quality of conversion it did. This program will take a scanned IMG file, convert it to a color picture with your palette choice (different shades of red or blue, etc) and then export it in eight different formats. It does highly detailed work with no staircasing, and the results are beautiful. For $59 you can't go wrong with it. ColorScan is an impressive program with lots of potential and has been in development for over six months.

Taylor Ridge

Taylor Ridge reps were on hand selling copies of Clayton Walnum's C-Manship book and program-listing disks ($19.95 US for book and $10 US for two listing disks). Also being sold was a book titled Beyond Nintendo Masters co-written by Clayton Walnum and Andy Eddy, and forwarded by Orson Scott Card ($9.95 US)

Unicorn Publications

Bill and Pattie Rayl had a lot of fingers pointing at and ooh's and aah's floating in the direction of their booth. No, Bill wasn't bending forks with his mind, they had some incredible Lexicor animations running on a TT. About 10-15 disks of Lexicor animations were being made available for $5 a disk, five for $20 and so on. About half of them ran on the older STs. I bought all six of the ST-compatible disks, ran them as soon as I got home and was very pleased with the quality. I highly recommend these to anyone who wants to turn your computer into a conversation piece at a user group meeting or a family get-together.

And, of course, Bill and Pattie were selling Atari Interface magazine subscriptions and T-shirts with a past cover silk-screened on the front.

Wiz Works

Chet Walters was demoing the latest version of MugShot, MugShot Plus, version 1.5. This very easy-to-use, fun-filled, fully icon-driven program added a Plus to its name for a very good reason. By clicking on an icon of a hand painting a face, you enter into a full-featured paint program with excellent brush and spray control to fine tune your Mug creations. Of course, as usual, Chet was giving away a free MugShot mug with every purchase of MugShot.

I had an interesting and heart warming experience at Chet's booth. After having MugShot Plus demo'ed to me and my video guy, we were so impressed that we both bought a copy. Chet then pulled out a data disk and gave it to each of us explaining that he was also impressed by our honesty, noting that we very well could have copied the disk. Wiz Works gets very little proportionate return on some great software and I am impressed that he would show his users even more respect.

Dr. Bob, William Parks was showing the latest update to MVG at the Wiz Works booth. The good doctor was also passing out a large glossy calendar that I saw in lots of peoples' hands. Every once in a while, I would see William walking around in shades trying as much as possible to be incognito and hide from the software groupies.

Finally, Geoff Earle and Bob Brodie announced an interesting new program that will be on trial this coming November 23 & 24 in Chicago. Atari plans on doing shows where they will work with local user groups to put on an extravaganza in top-notch facilities. Geoff and Bob also announced workshops will be set up at these shows that will be handled more like a classroom.

There is more I could have reported on, but to be honest with you, I have run out of steam and time.

Developers attending the Windsor/Detroit show or mentioned in this article include:

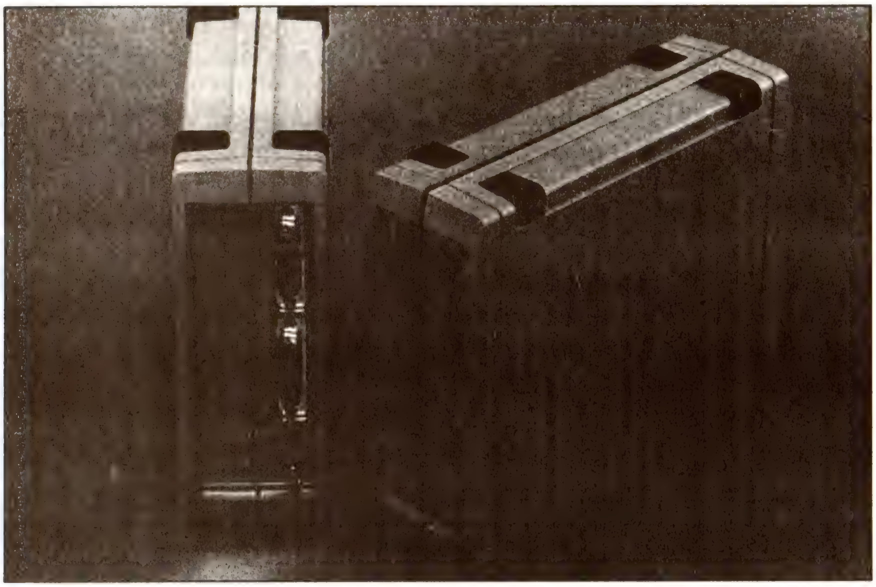
SUPERCHARGER V1.4

BREAKS THROUGH THE BARRIER

Full MS-DOS Compatability With Real Time Multi-Tasking Plus **EXPANDABILITY**



NO INTERNAL
MODIFICATIONS
REQUIRED

PLUGS DIRECTLY INTO THE
DMA PORT OF YOUR
COMPUTER

MS-DOS INCLUDED

- RUNS CGA AND HERCULES
- EQUIPPED WITH 1 MEG RAM
- USES EXISTING MOUSE AS DOS MOUSE
- SUPPORTS 5.25" OR 3.5" AS SECOND DRIVE
- PRINTS TO THE ATARI LASER FROM DOS
- SUPPORTS ALL HARD DISKS WITH AHDI DRIVER
- SUPPORTS ALL PARALLEL PRINTERS
- USES ST SERIAL PORT UP TO 9600 BAUD
- ATARI 3.5" DISK READS/WRITES AS 720K DOS
- SOCKET FOR 8087-2 CO-PROCESSOR
- USES SUPERCHARGER'S RAM AS 1 MEG RAM DISK
- USES ST'S RAM AS RAM DISK IN DOS
- RUNS 286 AND 3.0 WINDOWS
- BUILT IN BUS FOR FUTURE EXPANSION
- SEPERATE 5V DC SUPPLY
- INSTALLATION MANUAL
- 12 MONTH WARRANTY
- SHIELDED ABS CASE (FCC CLASS A CERT.)
- ONLY 6.25 X 7.25 X 2.25 IN.

SUPERCHARGER OPTIONS SOON TO BE RELEASED

SCplus/NET - Full networking board
- Connect DOS and TOS programs or files under Novell™ etc.
- Transfer rates of 2.5 Mbits/sec.
- Plugs into existing expansion connector with no soldering required.

SCplus/286 - Turns SuperCharger into a full 286 co-computer
- Runs at 12 MHz on a pure AT chip set
- Comes with 1 Meg of RAM expandable to 4 Meg - full EMS support
- Contains true AT expasnsion slots - accepts ANY expansion card
- Provision for an 80286 co-processor
- Plugs into existing V30 socket with no soldering required.

SCplus/386 - Turns SuperCharger into a full 386 co-computer
- Runs at 16 MHz on a pure 386 chip set
- Comes with 1 Meg of RAM expandable to 4 Meg - full EMS support
- Contains true expasnsion slots - accepts ANY expansion card
- Provision for an 80386 co-processor
- Plugs into existing V30 socket with no soldering required.

TRUE MULTI -TASKING

Connect several superchargers together to run different programs concurrently

HOT KEY

Allows TOS/DOS switching without rebooting.

TOOLBOX

Programming interface to allow programmers to develop their own background tasks.

LAUNCHER

Execute DOS programs directly from your TOS window.

SuperCharger - Only

$450

V1.4 Upgrade Kit - $19.95

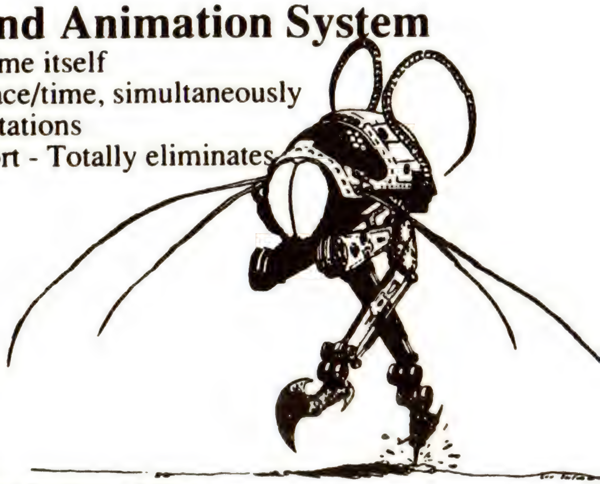
Take Total Control Of

TIME and SPACE

PHASE-4™ Solid Object Motion Control and Animation System

- Opens a 4th dimension in which you actually cut, copy and paste time itself
- View 3D objects in the past, present or future from any point in space/time, simultaneously
- Do cyclic polymorphic transformations without point and face limitations
- Fully mouse- and tablet- driven programming with keyboard support - Totally eliminates program control codes
- Supports all ST and TT resolutions
- Outputs to P.I.X.A.R.'s Renderman RIB files



ROSETTA-3D Translator/Viewer - $89.95

☐ Translate from one CAD, animation or rendering format into any other supporte
☐ Translation file size limited only by mass storage device - not memory size
☐ Translate entire folders using wildcards
☐ Import individual objects from within a file
☐ Quickly create and preview animations with simple "point-and-click" animation
☐ Unique 3D object marker enables design of animation storyboards in seconds not minuites or hours
☐ High speed wireframe and depth-cue wireframe modes
☐ Amazingly fast depth-cue point cloud mode for real time playback of large objects
☐ Several solid polygon modes - uses revolutionary new polygon drawing algorithm for lightning fast display

CHRONOS Key Frame Animator - $249.95

☐ Create stunning and complicated 3D animations without programming a single line of code
☐ Makes animation as simple as point-and-click... no complicated motion control language
☐ Point-and-click object, camera and light manipulation provides very inuitive user interface
☐ Spotlighting and shadow casting funtions built in
☐ Unique ability to cut, copy and paste motion for repeating complex motion sequences
☐ Data compatible with all Cyber™ series products

PRISM PAINT Drawing Program - $79.95

☐ Runs in all ATARI™ resolutions plus 1024X768 4096 color mode
☐ 24 bit true color mode with 16 million on screen colors
☐ All the standard paint program functions (circle, box, elipse, fill, cut, paste, copy, pixel editing etc.)
☐ Supports the Cal-Comp graphics tablet in four resolutions
☐ Create animations using the built-in slide show features

PRISM RENDER - $89.95

☐ Turns wire frame creations into "photographic" quality images
☐ Materials editor turns rendered surface into wood, chrome etc.

PRISM TABLET DRIVER - $49.95
PRISM TABLET w/driver - $224.95

Free Compuserve On-Line Support

BATTLEHAWKS 1942

(FLY WITH THE NAVY, SON)

Gordon Totty (MACE)

Sorry about that sub-title ladies, but women were not allowed to fly combat missions in WWII, the setting for this excellent simulation. (Are you free to do so today? Do you want to? Read on.)

Using Battlehawks 1942 from Lucasfilm Games, boys, women, men, girls and people of any sex can try to imagine the experience of flying naval air combat missions in the Pacific in 1942.

I tried it, and I imagined images that had nothing to do with a word like "battlehawks." What kind of a man does it take, I wondered, to climb into an aircraft that might be called a "flying coffin" because of its technological inferiority, take off from the deck of a heaving ship and go look for potentially superior enemy airplanes?

At one point during the battle of Midway, a major American victory and turning point in the war, 41 American torpedo planes attacked Japanese carriers. A swarm of Zero fighters destroyed 37 of these planes, and not a single torpedo hit any Japanese ship! Four of our pilots made it back. What could have ever made them take off again? Fear? High pay? Glory? Lunacy? Good fringe benefits? Patriotism? Joie de vivre?

None of the above. It was heroism; they were heroes. "Heroes" is sort of defined for you in the Designer Notes section of the manual supplied with the simulation. According to Havelock Ellis, "Heroes exterminate each other for the benefit of people who are not heroes."

Much as I might wonder about that, mine is not to reason why; my job is to get on with the review.

You do not have to read the entire 128-page book that comes with Battlehawks, but if you like simulations you already know that a major portion of the action will be in your imagination no matter how great the graphics might be.

Getting Started

The book helps set the stage for the program—which does have nice graphics—to work some magic for you. For me, a lot of the initial impact of Battlehawks caused me to wonder about the above questions. It must have been scary in those early WWII planes, scarier than I could possibly imagine. So far, I have been "killed" about every way imaginable in this simulation.

Here's the challenge posed by a torpedo run: Your American plane is slow, and not as maneuverable as the Japanese aircraft. Their ships are heavily armed, and usually well-protected by air cover. You must get close enough for the torpedo to reach the target.

You cannot drop it from a high altitude; it must be released at about 100 feet or so above the water. If you are too high there is a large risk that the torpedo will break apart on impact with the water. You must be flying dead level when you let it go, or the damn thing might just nose into the water, dive and run under the target.

You should come straight at the ship, and then turn to do your final run from the side so that the ship presents a bigger target. Oh, you should know that the maximum fire power is directed at you from the side of the ship. Please ignore the deadly flak; you mustn't be distracted at this time.

Speaking of dead, are you dead level? Slow enough? Don't stall! Close enough yet? Should you drop it now? Is that a Zero coming down on you from behind? Where is your wing man? Said any prayers lately? Were you really sincere? ("Oh, Lord, why me.....?")

Now, do you want your heart broken? You only carry one of those magnificent torpedoes. You risked your life like you never did before. Your run was perfect. You ignored all danger and kept your plane level, slow and low. Your torpedo hit the water perfectly, and you evaded the attack from above and behind. Most of the flak missed your plane.

The torpedo ran to the target, hit it squarely, and...plunk, no boom....another damned *dud!!!* Hey, cheer up; you might have scared them for awhile!

Oh well, if this were real, you would get back to the Enterprise. You could still reload and make another run before dark. Somebody has got to stop the Kaga, the Akagi, the Soryu.

The miracle of WWII is that under conditions like the above, our fathers or grandfathers did it. They stopped better planes and what was, in early 1942, a better and bigger navy. The rest of the story is in the manual. You don't have to read it, but if you are interested enough to buy the simulation, you will want to read the manual.

The manual for Battlehawks is one of the best I have ever seen. It is very well put together in all aspects, including the metal ring binding that allows it to lay flat when open. It lacks an index, but the Table of Contents and organization are so clear that you don't need an index.

It is loaded with fascinating pictures and quotes from people who were involved in the battles. It is a professional job of the first rank, with good use of fonts and layout, and not a single improper spelling. (That's getting to be uncomon [sic] today, folks.)

Sections include: Historical Overview, Game Play, Reference Information, Flight Fundamentals, Aerial Tactics and Tips, Designer Notes, Bibliography, Color Battle Maps and sections on Japanese and American aircraft and ships. The maps are not needed. The game play is very clearly explained, with maybe one exception noted below. The historical stuff and designer notes are the kind of things that you could skip—not directly related to game play. Don't. Great reading!

I thought the manual so good that I almost want to say it is the best part of Battlehawks 1942. That might be unfair. The simulation is very good, though some problems will be mentioned before this review concludes.

Real Life

One reason for the excellence of the manual and the simulation is that Lucasfilm used the help of a retired flier as a consultant on both the manual and the technical details of the simulation. Another retired flier also provided technical information. The first of these is Lieutenant Commander Richard H. Best, U.S.N. (Ret.). I don't know if Dick Best is a "Battlehawk." If he's like my uncles who were also in the South Pacific at that time, he'd probably laugh at such a title. Yet, read his own words from page 6 of the manual:

"The six months I flew combat missions from the Enterprise were probably the best six months of my life. My greatest thrill came on the morning of June 4, 1942, at the Battle of Midway. As I started my bombing run on the Japanese carrier Akagi, I saw its great big tan-colored deck with a tremendous orange Rising Sun painted on the deck just forward of the bridge, and I couldn't believe I was there. I had this tremendous feeling of holding the upper hand; it was heaven!"

Guys like him saved my butt. Maybe yours, too. I was growing up in a coastal area at the time, and well remember the fears that bombings and invasion of the United States were possible. We had air raid drills, and if the siren went off at night we never knew if it was a drill or the real thing. All lights would be immediately doused.

Have you ever seen a totally blacked-out city at night? Traffic stops so vehicle lights can be turned off.

Making the impossible merely amazing..."

E **PowerDrive**™
Put a 'Ferrari in your Atari'.
The **PowerDrive** modification board allows use of High Density floppy drives to give you up to 1.7 megs per floppy, while maintaining complete compatibility with all standard ST formats.

Modification kit	**$139.95**
Complete External Package	**$349.95**

THE LapMate™
The **FIRST** floppy drive designed for use on both the Atari ST and IBM PC!
Perfect for laptop computers because of its **low profile and light weight.**

NEW ITEMS!

LapMate 720K Drive **(inludes ST or PC cable)**	**$199.95**
ST cable for LapMate	**$25.95**

We are proud to offer DiamondBack II bundled with the PowerDrive!
FREE with external package.
$29.95 with any other PowerDrive configuration.
DiamondBack II $49.95

CARTOGRAPHER
The Editor for Chaos Strikes Back™ and DungeonMaster™
With our easy to use **GEM** based editor, display maps from ***your*** saved games and edit them at will. Remove obstacles and walls. Open some or all doors, or change doors to button operated ones. List character stats and view 30 pics at a time. Spell List included.
Only $19.95

Utilities
The best in tools from **DreamPark!**
The cream of development tools from the DreamPark skunkworks, crammed with useful utilities for your hard disk, floppies, and general ST use. No ST user should be without them!
Only **$19.95**

Coming SOON... Objective GEM
The EASY way to program GEM applications for the Atari ST! A complete function library for 'C' programmers. Only $49.95

MakPort
Now, attach Mac Hard Drives and removables to your ST! Allows use in both ST and Spectre modes. With Spectre 3.0 move Syquest cartridges between your ST and other Macs!
Only $189.95

We accept Visa, MasterCard, C.O.D.

Street lights go out. Every structure turns black. Did you ever know that a bombardier might be watching to see even just a match light up for a clue as to where you live?

"Air raid wardens" would come out (with helmets firmly on heads) to see if the neighborhood was properly dark enough. Neighborhood volunteer aircraft spotters would sit on rooftops and watch the skies. Where are they? Will this be the night? We were lucky. No explosion ever came. Explosions stayed far away, where Battlehawks fought.

Kids shouldn't have to lay awake and worry about stuff like that. (Perhaps it prepared us psychologically for the Cold War's nuclear warfare scares and the construction of bomb shelters.)

Nearly fifty years later, it is exciting to try my hand at flying under the conditions simulated in Battlehawks 1942. From the main menu, you may select training or active duty. Lots of training is recommended. You may practice fighter intercept, fighter escort, dive-bombing (a tricky business if ever there was one), and torpedo-bombing (even trickier, and more dangerous in my opinion).

When you are ready for active duty, you have to first pick your battle: Coral Sea, Midway, Eastern Solomons or the Santa Cruz Islands. One 10 minute stretch in the Battle of Midway is described as "probably the most critical ten minutes of the entire war." You can try to experience some of those minutes.

For each of these famous battles, four missions are available, e.g. "You fly a Dauntless dive bomber as the wing man for Lieutenant Dick Best as he makes his run on the carrier Akagi. Enemy fighters are at low level, having just devastated the American torpedo planes. Follow Lt. Best in and drop your bomb on the carrier. (Historically, both bombs hit, and Lt. Best went on to become one of the first heroes of the war, and later the Battlehawks technical advisor.)"

Wow! Let's go with Dick! Here's a tip for you when you do try this one: The key word in the explanation is "follow"—keep Best's plane in sight at all times, and do as he does. I lost him on my first run at this, and got shot down looking for him.

There's more. I didn't tell you that you can also play this from the Japanese side. So, for each of the four battles there are also four Japanese missions. In all, if my elementary math is correct, there are 32 separate missions available to you in Battlehawks.

Be warned that if you want to fly as a Japanese pilot, you must first create him following the instructions for setting up a Service Record disk. I didn't think that the documentation was very clear on this, and wondered for a while why I could not train as a Japanese pilot.

The missions vary for the Americans and the Japanese, but the cockpit controls and Ready Room scenes are nearly identical.

You may review the various planes used in the simulation, and even rotate one of the two images to see any plane from several different angles. It is amazing how much Lucasfilm has crammed into two disks. I won't try to mention names of the folks responsible for all this, as about two dozen are listed in the manual.

The last option on the main screen is Review Service Records. When you create a Service Record disk, your successes, failures, medals, and promotions will be recorded in the simulation. If you go down with your plane, you will be KIA and have to create a new pilot to continue. You may, if you wish, fly under several different names representing different pilots. You will be retired after 16 missions. No Catch-22 here. (Lose too many planes and you will be grounded before you are eligible to retire!) I don't think that there is any limit on the number of pilots, as data is maintained on the separate Service Record disk that you format and supply.

For every mission, you must swap disks for the pilot records to be updated. Also, for every new mission you must pass a "recognition test" by matching a picture on the monitor with one in the manual. You don't have to do this if you are flying the same mission over.

During flight, you may turn on a "camera" and later run the film to see a replay of what you just did. You may even modify your viewing angle. Unfortunately, you can't run this after a crash or bail out to see how you got in trouble, but you may use it at any time during flight. Action is temporarily suspended while you watch the movies.

You will be a busy devil in combat, as you have to operate your rear gun (if so equipped) as well as fly. You hop back and forth between the two seats by selecting front or rear view. You cannot be successful and ignore the rear gun, though the temptation to forget it is great during learning.

After your mission you will get a flight review, including some comments that might be helpful and a score card of damage inflicted.

Battlehawks is an excellent effort. Nevertheless, there are some problems to be mentioned.

For one thing, I was disappointed by the lack of take-offs and landings. Your mission starts with you already in the air and near the target. You may even select your initial altitude. In some ways, this saves time. The rate of climb of these aircraft was slow; it takes a day less than forever to attain 15,000 feet. (For an interesting sensation, fly this simulation for a while, and then switch to your favorite jet simulation. Experience a slight hint of the enormous technological advances since early WWII.) Also, once you can do it well, taking off over and over might become a drag, further delaying the action.

Landings are a different story, however. These should really have been included. When a mission is over, perhaps right after you drop your bomb, you just hit "q" and you are returned to the ready room for flight review.

Some Problems

For me, that was a real simulation let down, a real mood or imagination destroyer. Don't you have to escape? Aren't you sometimes chased? Low on fuel? Damaged and limping along? Lost? Will you have a hard time making a safe landing? What's the weather like? Is your carrier under attack? Maybe I am asking for the moon, but it would have been much nicer if at least some of this could have been included.

The mouse operated well enough in flight mode, but I found the arrow keys much more convenient for menu selections. There is one place where you must select a flag, if you wish to review the Japanese aircraft. This was tricky. Use the arrow keys to highlight, and then use either the left or right mouse button to select left or right flag. Though a gripe, I consider this minor.

The final complaint that I should pass on to you relates to the graphics. Good. Even very good. Almost excellent. Not great. Jagged lines in the combat scenes was my biggest complaint. I know, this is a function of the display resolution. Some programs seem to avoid it more than others, however. Maybe I expected too much.

I don't regard any of these complaints as fatal flaws. My expectations were high. If I sound like I think a lot was missing, let me assure you a lot is there. I liked Battlehawks 1942.

Fly it; you'll like it. Fly it too much and the flak from your parents or spouse will not be simulated.

BEST Electronics
New Product Release
520/520STFM/1040ST Computers
NEW WORLD II SERIES
2/2.5/4 MEG SIMM UPGRADE BOARD
Features:

- Upgrade P.C.B. is only 3" X 4" in size. With low profile Simms installed the overall height is 3/4"
- Uses the State of the Art 8 or 9 chip Low cost 1 Meg Simm Ram modules
- All Simm Ram modules are Safety Buffered with High Speed Buffer I.C.'s
- Compared to standard 4 Meg Ram upgrades using 1 Meg Ram chips, the New World II Simm Ram upgrade has 456 Less Ram chip to socket contacts for Better overall stability
- The New World II series Simm Ram upgrade is designed around the knowledge gained in manufacturing of the New World I Ram Upgrade, one of the oldest (over 7 years) and most Stable ST Ram Upgrades Still on the market
- Complete well documented Installation Instructions and Ram Check program included
- Full Support from a Company that has been serving the Atari Community for over 8 years!
- New World II Suggested retail of $129.95 (less Simms)

ANSWERS, TIPS AND RELEVANT INFORMATION

Paul V. Alhart (AFED)

Another AtariWriter+ Mod

The Atari XL/XE operating system has several changes from the original 400/800 operating system. One of these change allows the user to modify the KEY REPEAT RATE by changing the value stored in memory location 730 ($02DA).

From BASIC, POKE 730 with different values to see the effect. The default value is 6 but I find 2 to be more to my liking. It causes key repeats to be much faster allowing you to move the cursor around the screen quicker while editing.

The Problem

This would be a great asset when editing an AtariWriter+ file, but you can not POKE 730,2 from within AW+. Also the default value of 6 is restored to location 730 whenever your computer is turned on or RESET is pressed.

The Solution

We can change the code of the AW+ program to put our value of 2 in location 730 for us. We don't want to disturb any vital existing code and we want to make the change RESET proof. My answer is to replace the AW+ ATRACT routine with my code.

Normally when no keys are pressed for 7 to 9 minutes the operating system enables the ATRACT mode. This causes all the screen colors to rotate at reduced luminance levels to keep images from being "burned" into your screen. The ATRACT mode is cancelled by the operating system whenever any key is pressed. For aesthetic reasons the programmers of AW+ added a routine that holds the background color to dark blue while still allowing the other colors to rotate during the ATRACT mode.

By placing our new code in place of this routine the background color will be allowed to rotate during ATRACT mode (so what?) and our XL/XE machines will have a much faster KEY REPEAT RATE. This AW+ mod will only be effective on an XL or XE Atari. The modified program will still function normally on the 400/800, affecting only the background color during the ATRACT mode, but not the KEY REPEAT RATE.

How to Do It

With a sector editor, find the following byte string in the file AP.OBJ (either (48K or 130XE version):

```
A5 4D 10 02 A2 94
```

Replace it with:

```
A9 02 8D DA 02 EA
```

If enough interest is shown, I will write DefaultWriter+ Companion #4 to make this change to AW+, and put it in a future issue of AIM as a BASIC type-in program.

There was some good feedback regarding my RANA article that appeared in the Dec. 1990 issue of AIM. An AIM reader in Pennsylvania is sending me some new information I will pass on to you in a future article. Remember ATARI is written for you. Any questions or input is appreciated.

Contact me at 524 North Zee St., Lompoc, CA 93436.

ANTIC MUSIC PROCESSOR ENHANCEMENT

John McGowan

The ANTIC Music Processor (first made available in the December 1988 issue of ANTIC) has become, in the words of STart, "one of ANTIC's most popular programs." However, the only playback option available was on a single-song basis. This was remedied in the Feb/Mar 1991 issue of STart in which a type in version of a "jukebox" player was presented.

This JUKEBOX.EXE program was to have permitted you to "play a disk full of songs without pressing a single key." However, it required pressing a single key every few minutes in order to suppress the ATRACT mode, which the program fails to address.

At the end of this article is a BASIC program suitable for use on the version of the JUKEBOX.EXE program typed in from STart. To use it, either type in the program from STart or obtain it from your local users' group or BBS (if available). Type in the BASIC program listed in this article. Place a disk with the STart program in D1: (make sure it is labelled JUKEBOX.EXE) and run the BASIC program. The BASIC program will create a program called JUKE1.COM on D1: (taking about 25 single-density sectors, so make sure sufficient room remains) which suppresses the ATRACT mode.

If you use the JUKE1.COM program to play your music files, you will indeed be able to play a full disk of *.AMP songs "without pressing a single key."

Technical Notes

The patch to the program is quite simple and is included here in case the method may be useful to other programmers.

A disassembly of the JUKEBOX.EXE programme indicates that it does *not* use Page 6 and that song files are accessed with a JSR CIOV (CIOV=$E456) command. The several accesses to CIOV were replaced with the command JSR $0600 and the following code was placed in Page 6:

PHP: PHA: LDA #0: STA ATRACT: PLA: PLP: JMP CIOV

Where the ATRACT register is at $4D (ATRACT= $4D=77).

This results in cancelling ATRACT mode upon any access to CIOV (in particular upon the load of each song).

Basic program to convert JUKEBOX.EXE to suppress the ATRACT mode:

The ATARI XL/XE Commercial Software Drought is OVER !!!

SOFTWARE INFINITY proudly presents its Brand NEW *KE-SOFT Series* -- the First Major ATARI XL/XE Commercial GAME Releases to be produced for the North American market since 1987 !! Eleven spellbinding super-sophisticated 1991 GAMES on 9 economically-priced premium quality Disks ! Already Bestsellers in Europe -- newly enhanced to revitalize your XL/XE !

Every GAME in *SI's KE-SOFT* line boasts ultra-realistic & colorful state of the art high-resolution animated graphics, outstanding music, and lots of clever surprises. Many also feature digitized speech & sound effects, high-score saves, a password system to skip levels, and a capable Editor to near-effortlessly create your own new screens. Handsome and comprehensively detailed printed Instruction Manuals are written in clear, easily understandable English. All 11 superior 64K *KE-SOFT* titles are endlessly entertaining to novice and experienced ATARI GAMErs alike.

$10.50 GAMES
2 or more for $9.50 each !

ZADOR

Turn over all 144 Chinese-symbol tiles on the game board by matching singles to make pairs that are solely connectible by an invisible line (which can't cross any active tiles or be bent more than twice)! A high-powered Mah-Jong variant with 20 levels and useful "prompt next pair" option.

DRAG

Guide intrepid Drag the Frog past deadly mines, exploding bombs, & falling rocks in a treacherous underground lair, to collect diamonds before his air runs out! 50 screens of Boulderdash-type arcade action.

SOGON

Navigate your sturdy forklift around the 50 barrier-filled floors of a skyscraper to relocate large boxes one at a time to waiting storage bays. Once you've moved a box to any perimeter-wall or partition, you can't pull it back! Devious chess-like strategy; vital backup-one-move function.

ZEBU-LAND

Help Zebu engineer the escape of his 3 brothers from a 50-level labyrinthine world of revolving doors and blocked passageways (move wall-segments aside to reveal exits)!

DREDIS

At last -- the unparalleled mind-boggling Commercial ATARI XL/XE version of the arcade champ Tetris! Ultra-challenging puzzle, multiple levels of difficulty, one- and 2 - player modes.

Order 3 or more *KE-SOFT* GAME titles Mixed ($14.50 & $10.50 items together) -- subtract $1.50 from the price of each !

BACKUP COPY of any GAME Disk is $2.00 if purchased at same time as Original; $ 4.00 if ordered later.
Great *KE-SOFT* GAMES *DEMO DISK* with playable sample screens -- FREE with any 2 GAME Disks, or $4.00 separately.

SHIPPING And HANDLING is always just $3.00, regardless of quantity of *KE-SOFT* products ordered.
NO State Sales Tax is due on any SI Disk.

$14.50 GAMES
2 or more for $12.50 each !

TECHNO NINJA

Voyage to a hostile alien world to reclaim your home planet's ultimate source of power! Encounter 10 perilous landscapes (cities, bodies of water, spaceships, etc.) on 100 screens. Gain energy, earn up to 8 extra weapons, battle over 50 varieties of monsters. Enhanced density disk.

CULTIVATION / CHROMATICS

Two brain-busting puzzlers on one disk!
CULTIVATION: Put away your Farmer's Almanac -- this game's about the strategic "cultivation" of matching symbol-blocks; push together like singles in the proper order to make pairs and clear your choice of100 screens on 10 levels.
CHROMATICS: This mesmerizing 3-level Tetris-style contest utilizes 3 - 5 different colors instead of shapes; rotate the hues of blocks falling into a well to place 3 or more same-colored blocks together at the bottom.

OBLITROID

As the last Star Warrior of Xyros, you must track the evil Tindalos to his underground dungeon and engage in mortal combat! Find special weaponry to survive never-before-seen dangers on 4 Worlds comprising 140 screens; invaluable stop/continue mode. Extensive Manual is packed full of maps & tips. Enhanced density disk.

TOBOT / BROS

Two Invigorating arcade adventures for the price of one!
TOBOT: Using his versatile laser gun, our robot superhero must escape a spooky 50-room castle filled with angry spiders!
BROS (Super Mario Brothers - inspired): Traverse 8 Worlds with 4 Underworlds each to rescue your brother from a hidden castle -- collect mushrooms to get power or shots, gather coins to earn additional lives, and vanquish legions of monsters!

The Right Brain

Paul Stampfli (ACCEPT)

Well, it sure has been awhile since we've talked, hasn't it? Our country has fought, and won, an armed conflict (dare I say the W word?), and we have proven that our army can fight.

The victory was almost too easy, in that it 'looked' easy on the TV from the living room couch. It wasn't all that easy, and the potential was there for it to be almost impossible to win and to last practically forever. The bunker systems that have been uncovered, and the weapons and supplies found, indicate that Saddam's forces were there for the long conflict.

Thankfully, they panicked when they saw the fight and determination in our troops, and fled the field. But I'll bet money that the whole situation over there is a *long* way from being over.

Things are happening at ACCEPT also. Maybe not ponderous, earth-shaking events, but some very interesting stuff. Firstly, Tim got all PO'd about how just a few of us, mostly him, were bringing systems to the club meetings and he ragged everyone out on the BBS (STEEP).

So, last meeting we had about 15 members present and a total of six systems running. This was a great meeting, and it restored my faith in the club. I'm sure Tim will have something to say about it in his notes.

We got a lot of work done at that meeting. We have agreed, in principal, to not only allow, but to invite, Mac and IBM owners to join our happy little band; and to change our name, (oh no, not again) to the *advanced* Computer Club of El Paso. This name change will more accurately reflect what we are trying to do with the group. (And is something I have been personally trying to do for quite some time now.)

Trackballs vs Mice

We also had the great Trackball Roll Off, which almost got lost in all the excitement. (Well, it was kind of a bust, actually.) I had five people actually do the test and fill out the survey.

The survey was 17 questions and covered all the topics I could think of that might be important, such as button and ball size, location, speed, accuracy, appearance and general quality of the device, as well as esoteric data such as "feel" and "ergonomics."

Question 17 was the killer with; "Would you purchase this device based on the information and demonstration presented in this Roll-off?" The contestants were the Kraft Triple-track 3 button controller, and the Best 2 button trackball.

As they say, the margin of victory was small. Best won by 12 points; 249 to 237. But the real story was told in another area, the total points possible were 425! One respondent expressed a slight interest in buying either device, but two respondents outright said *no* they would not buy.

One even wrote me a comment at the bottom of the survey that "Mouse balls stink." That's a quote, I didn't make it up. So, as far as the survey goes, the mouse reigns supreme and the trackball is a second-rate citizen.

So much for objectivity. I love the Trackball, and I much prefer the Best to the Kraft. Tim and I did not take part in the survey because we are biased.

I think a large part of making the change from mouse to trackball is in the use of the thing. I found the trackball clumsy at first, but the more I worked with it, the better I liked it. The mouse certainly has a place, but so does the trackball.

My solution? I got a Mouse Master (Practical Solutions) and hooked up my trackball and my IR Mouse (hamster, also by Practical Solutions), and now I think I have the best of both worlds.

By the Way

As you can tell, I use quite a bit of Practical Solutions' hardware. I am touched to see the recent articles saying they have shut down and gone out of business. This company made fine products for the ST line and I know that we will miss their support.

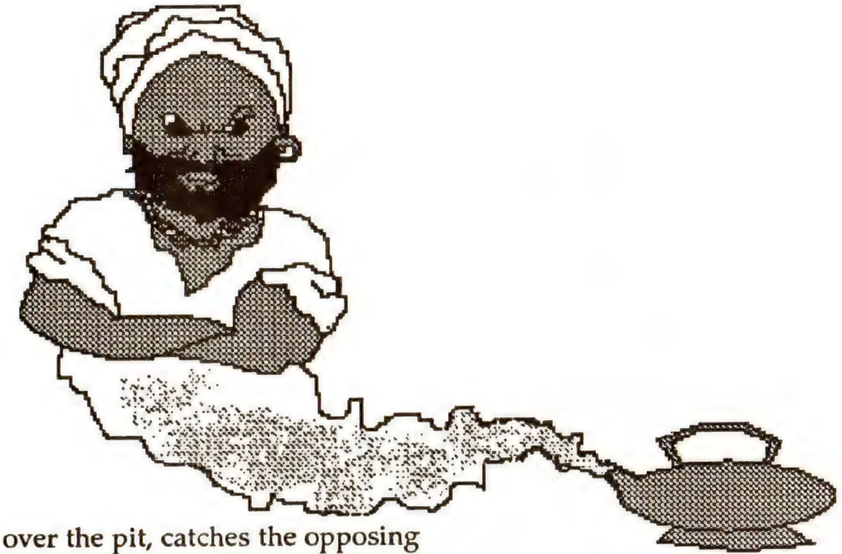
I have recently seen the IR mouse appearing in Mac magazines. Whether this means they are truly out of business and sold their patents, or are just changing areas, I don't know.

But the mice are being marketed in the Mac arena under two different names by two different companies. Most of the time, when a company goes out of business, their products get dumped and people worry about support.

It is a testament to Practical Solutions that I am *not* worried about support. All the hardware I got from them is built very solidly and has never needed any service or attention.

What more can you ask for?

Prince of Persia



Thomas Girsch (MAST)

[This review was originally printed in the April 1991 issue of the Milwaukee Atari ST newsletter, and was revised on 5/14/91 for inclusion in Atari Interface.]

Does anyone remember the game Karateka? Of course, the question is rhetorical.

Karateka was seen by many as the greatest computer game of all time. Let me enlighten you, however. Karateka is a simple, run of the mill game. I hear cries of *blasphemy!* But one look at the new game from Jordan Mechner, creator of Karateka, and you will most certainly agree. The game is Prince of Persia. And the experience is unbelievable.

The premise of the game is typical: In the absence of the Sultan, an upstart seizes the throne and demands that the Sultan's daughter agree to marry him (don't they always demand that?) or she dies in one hour. The princess' only hope is a wandering adventurer who (of course) happens to be trapped in the Palace dungeon. And that adventurer is played (of course) by you.

But, the game itself is anything but typical!

The game contains animated sequences smoother than any previously released for home computers. Hundreds of movie clips were used to be certain that every position, every angle, every frame was perfect.

To be sure, watching someone with a good deal of skill is like watching a good Indiana Jones-style action film. The hero leaps over the pit, catches the opposing ledge with mere fingertips, and then crawls under the iron gate just moments before it slams shut. Then he must dispose of the thug who awaits him!

The game is the opposite, in many senses, of Othello, especially in this respect: It is very difficult to learn, but relatively easy to master.

That is, there are certain spots which one may spend hours learning to get past. Once these are overcome, however, getting past them again is fairly routine. This is one of the things I liked best about the game. (Nothing is more frustrating than losing your last life on a section you *know* how to get through. This has happened to me numerous times in lesser games).

To make things even nicer, you may save your game at the beginning of any level (3 or higher) in Prince of Persia (there are 13), and you may continue as often as necessary, as long as your 60 minutes (real time) do not expire.

At the outset, the game looks like a pretty typical platform game. Until, that is, you start moving. It boggles the mind that so many moves can be controlled by a single joystick! You can run, duck, walk carefully, jump up, jump carefully across a chasm, jump *far* across a chasm, climb up, climb down, jump down, advance, retreat, parry and thrust. (Someone tell me if I missed any!)

But enough of description. Verbal or written description cannot do justice to the game. You have to *see* this game to believe it! It was demoed at the April MAST meeting and the crowd was awed!

The only people who might dislike the game are those who outright *hate* games that require good reflexes and timing.

The copy protection scheme also adds fun to the game. Upon reaching level 2 or restoring a saved game, you are taken to a two room level which contains perhaps two dozen potions, each with a letter hovering over it. You must find the first letter of the word on the line and page specified and drink the corresponding potion. Finally, someone who made copy protection that was not only fair to all, but fun as well!!

All in all, the game *would* have received a 10, but there were a couple of minor problems.

Number one, the game comes on two double-sided disks. In itself, this is not a problem, but *nowhere* on the packaging, on the disks or in the manual does it tell you this. It is therefore conceivable that someone may unknowingly spend $40 on the game and not even be able to use it.

Also, I don't think the game will run with less than one meg of memory, but I am not certain, as this was not mentioned either. So Prince of Persia, because of minor discrepancies, comes close but ohhh so far from a perfect 10 with a 9.5.

I recommend this game to any action/puzzle player, as well as anyone who liked Karateka.

How To Improve Your Memory

Rodney Sullivan (CACE MI)

Several months ago I got the bug to install more memory in my computer, an Atari 520STFM. I began checking out the ads for memory expansion boards in the Atari-specific magazines. In December, I decided on the JRI Ram+ board. The JRI board uses SIMMS; Single In-line Memory Modules, in either 256K by 8 bit or 1Meg by 8 bit configurations. I figured anything that uses the latest in RAM technology should be simple to install and reliable.

I ordered the board from B&C Computervisions at a cost of $125 plus $5 shipping and was told I would receive it in about two weeks. I inquired about next day shipping, but was informed they did not ship next day. UPS delivered my board on Christmas Eve!

My hope for a quick and painless memory upgrade disappeared when I opened the box and found a JRI Ram+ revision C board, a handful of wire, a coil of solder, 5 or 6 photocopied pages of instructions, and a double-sided disk.

The Ram+ board has four sockets for the SIMMs allowing expansion all the way to 4 megabytes of RAM. The board also has two ribbon cables attached, at the end of one is a connector that piggy backs on top of an existing RAM chip (tack soldered in place) for the address bus signals.

On the end of the other ribbon cable is a small daughter board that installs in place of the computer's video shifter chip. The video shifter chip is then plugged into one of two sockets on the daughter board. The second socket is for an additional video shifter chip that increases the color palette to 4096 available colors.

Although the color palette can be expanded to 4096 colors, the maximum number of colors that can be displayed is still 16 in low resolution. (This is equivalent to the JRI 4096 color board; a second shifter chip is not required for the RAM upgrade.)

Also on the daughter board is a connector for an external Genlock device. The device is not yet available. *[Ed: I spoke with John Russell of JRI concerning their new Genlock device. It will incorporate their Capture digitizer and will plug in to the ST's cartridge port. Expected availability for the Genlock/Digitizer is late summer.]*

Programs included on the disk are TOS patches and a custom control panel to select colors from the increased color palette if you install a second shifter shift. Programs to patch Neochrome for access to the increased palette and a RAM test program are also included.

As I am not proficient at soldering, I inquired around Jackson for installation prices and found the estimates of $50 to $80 prohibitive. With the knowledge that I still had to spend about $100 on the SIMMs, I called B&C in early January to request a refund. I explained that the JRI board was not what I expected and I was looking at a rather expensive installation. Their reply was that B&C Computervisions does *not* refund.

Stuck with a solder-in upgrade board, I began investigating less costly alternatives to commercial installation. I approached an acquaintance at JCC, who is quite adept at soldering, and asked if he would consider installing my upgrade kit.

He agreed but said he had several other projects going and it would be some time before he could get to it. Confident that I had procured free (or nearly so) installation, I ordered from Hard Drives International (an advertiser in Computer Shopper) two 1Meg by 8 bit SIMMs at $45 each plus $10 shipping, and had them in my hands two days later. Now all I had to do was sit back and wait for my 'friend' at JCC.

February rolled around and I decided that just in case my 'friend' at JCC would never find the time, another alternative should be pursued. I began practicing soldering and desoldering on an old circuit board. I found out that desoldering without expensive equipment or a lot of patience is no fun.

On February 18, I could wait no longer and figured my new soldering skills would probably suffice. I took my computer to the basement where the cool, somewhat damp air would minimize static electric charges, (static electric charges can *destroy* computer chips). I stripped my computer to the motherboard, heated my soldering iron and nervously began desoldering resistors.

I had called JRI in January to clear up a couple thing about the instructions and found them very helpful. A suggestion made by the gentleman I spoke with was to install a socket in an empty Bank 2 RAM location on the computer's motherboard to provide a better connection for the address bus connector than would be obtained by piggy-backing on top of an existing RAM chip.

The installation proceeded without a hitch but took roughly 4 hours, considerably longer than I had anticipated. Each of the 40 solder connections to either the Ram+ board or to the motherboard was inspected with the aid of a magnifying glass to insure correct solder flow. The Ram+ board is positioned on the left side of the computer in front of the power supply and sort of floats above the mother board on three short, heavy ground wires. Removal of a portion of the upper RF shield was necessary as the Ram+ board with SIMMs installed prevented securing the shield. Also the top of the video shifter shielding was discarded.

I sweated bullets for nearly four hours while I was inside my computer and do not recommend installing the JRI Ram+ in your computer unless you are confident of your soldering abilities or know someone who is experienced at computer repair.

The moment of truth arrived at about 1:30a.m. when I plugged in only the computer and monitor (just in case something went wrong, all of my peripherals would not end up toast) and flicked the power switch on. My computer came to life. Phew! I turned the computer back off and plugged in my external double-sided drive, powered the system back up and loaded the RAM test program. A couple of minutes later, the screen informed me of 2,621,440 bytes available with zero errors.

My JRI memory upgrade to 2.5 Megabyte appears to work satisfactorily. However, I have noticed—even with Pinhead 1.8 installed, a fast-load utility from CodeHead's Charles Johnson—the busy bee stays on the screen considerably longer than before. I do not know if this is common to all large RAM upgrades or just this one. [Ed: This is normal and common to all upgrades. The more RAM you add, the longer it takes to clear at bootup. Pinhead dramatically reduces boot time of individual programs.]

Also I had the power supply fail in my computer last year, and I am concerned about the increased power requirements of a memory upgrade upon that repaired power supply.

On the plus side, I now have plenty of room to load my desk accessories and TSRs (terminate and stay resident) like Turbo ST and Universal Item Selector III. I now have room for a very large RAMdisk, which is great for copying double-sided disks when only one double-sided drive is available. I also have enough room for 73 frames captured with VIDI-ST!

Slightly
Used Software

What do you do with software & hardware you're bored with? Where can you find inexpensive programs (both new and used) and hardware? Look no further. PDC proudly presents a service that's already a major hit with our customers.

Call us at (206) 745-5980 or write to us for a free catalog (our 800 # is not equipped to take catalog requests). Products are sold on a first-buyer-gets-it basis, so check in to get what you're looking for today! We do buy software/hardware with cold hard cash (or check). Do not send unsolicited software, check with us first!

Sample buy: Rick Dangerous - $9 (new, still in shrink wrap, call for availability).

Can you say Totally Bitchin' and Awesome! You will when you get our newest catalog filled with 100+ **NEW** disks! Just call (206) 745-5980 or write to us. Get it now! Got it? Good!

Disk Requirements: 1 = 1 megabyte, C = color or M = monochrome monitor, D = double sided disk drive, J = Joystick, T=TOS 1.2/1.4

PDC, Dept. AIM, 4320 - 196th SW Suite B-140, Lynnwood, WA 98036-6721 / (206) 745-5980

MasterCard

No credit card surcharge; cards not charged until orders ready to ship. *Prices don't include shipping: $3 per order (Canada $3.50, Foreign $8 per 10 disks; both sent Airmail); 2nd Day Air $5 (US only;AK/HI add $3); COD's add $4.50 (Domestic US only). Slightly Used Software shipping: $3 in USA (Canada $6, Foreign call). WA residents add 8.1% on total (including shipping). Allow 2 weeks for checks to clear or send money order for immediate processing; **make checks payable in US funds to PDC**. Prices and contents subject to change without notice. Disks listed as xxx/xxx (where xxx is a disk number) are 2 separate disks and should be ordered as such. If ordering disks containing nudity, you must be over 21 years old and must say or write that you are when ordering (sign order form if by mail). PS: We're always available to help you with a problem, question, or just to have a friendly chat!

ZADOR

Bob Reitz (SPACE)

I am one of the lucky Atari users who owns both an Atari 8-bit and 16-bit machine. When the rush was on to upgrade to the more powerful ST machines, I somehow resisted the temptation to relegate my trusty 8-bit to computer oblivion.

The main reason I decided to keep my 8-bit was because of my investment in software. Much of which was purchased in the days when every new title was available for the Atari 8-bit.

I still love to play the classics like The Cosmic Balance, Archon, Crusade in Europe, Cytron Masters and MULE.

SHAREWARE for the Atari 8-Bit

The File Information Program

An easy to use disk library database manager developed for the Atari Clubs of Denver. Fast interactive search capability. Detailed descriptions of files possible. Docs included. $12.50

The Disk Labeler

Uses a variety of label sizes. Add Printshop Icons and use any 9 sector font file. Docs included. $10.00

If ordered together, $20.00 for both programs. FREE UPDATES for 1 year, full support for both programs through the Atari Clubs BBS.

Unfortunately for the loyal masses, Atari's decision to scale back support for their 8-bit computers quickly sent programmers scurrying to move their talents to other platforms and the developement of new entertainment software for the Atari 8-bit community screeched to a halt.

Well, enough ancient history. Here we are in 1991 and we all know that finding new 8-bit entertainment software has become all but impossible.

You can imagine my surprise when I opened a recent copy of Atari Interface and noticed an advertisement by Software Infinity describing *new* games by KE-SOFT for the Atari XE/XL (64k) computer.

The ad read, "KE-SOFT games boast colorful state of the art high resolution animated graphics, outstanding music, handsome and detailed instruction manuals and some have dititized speech and sound effects." All this at bargain prices! Could it be? I aimed to find out.

Scanning quickly through the software descriptions, I spied a game called ZADOR. Zador sounded a lot like Mah-Jongg, a game that I had long waited to make an appearace on the Atari 8-bit. I quickly wrote out a check and sent it off to Software Infinity.

Three weeks later, Zador arrived in the mail along with an excellent KE-SOFT demo disk that provided quality playable demos of many of their other entertainment titles.

It is rare that a company has enough confidence in their products to let a customer try before they buy. What a concept!

After spending several enjoyable hours playing through the KE-SOFT game demos, I decided it was time to get down to business and have a look at Zador.

On boot up, I was greeted by Zador's title screen accompanied with a well done, fast-paced oriental tune which is followed by the impressively-textured and colorful Zador game board.

The individual game pieces, or tiles, appear small but each are well drawn. The object of the game is to clear the board of tiles before the clock runs out. To accomplish this, you must match identical tiles or those from various tile groups (i.e. flowers, seasons, etc.). Tiles are quickly and easily selected by joystick.

There are twenty levels of increasing difficulty in Zador and KE-SOFT has thoughfully included both pause game and automatic high score save features.

Also, if you find yourself stuck for a match, you can request Zador to find matching tiles for you—up to three times per level.

Throughout Zador, game play is accented with various spot sound effects. The instructions for Zador are printed on one side of a folded, standard size sheet of heavy, colored paper which also serves as your disk packaging.

Zador is a professionally rendered, fast paced, addicting version of Mah-Jongg that should appeal to anyone looking for an alternative to arcade shoot-em ups.

Zador sells for a mere $10.50 and can be purchased from Software Infinity, 642 East Waring Ave., State College, PA 16801.

Backup of Data Files on your Hard Drive

Al Riesbeck (SCAT)

When one buys a hard drive the first thing the entire world informs you to do is "BACK IT UP." Now I am not saying backing up the hard drive is not a good thing to do, but using up floppy disks and a couple of hours of my time is not my idea of a fun thing to do.

The Problem

There are two kinds of files on a hard drive, programs from floppy disk and files these programs create.

The original programs obtained on floppy disk are all ready backed up. The files these programs create are not on floppy disks, therefore they are the real problems. I gave this problem much thought after I deleted my word perfect folder one day, which included nearly 20 documents. This event cause me to develop the following plan.

The Plan

For each group of data files associated with a program, create a folder for these files. (Examples: C:\WP\DOC for files used by Word Perfect; C:\GFA\SOURCE for files used by GFA BASIC; C:\STW\DOC for files used by ST Writer.)

Now you can use a Command Line Interpreter batch file to copy files from your data folders to floppy disks. Run this BAT file once a week. The BAT file would backup up all data files without using any brain power.

If the total size of your files are greater than 800K, use two or more floppy disks. This plan should not replace a full scale hard drive backup but will enhance the safety of your data.

My System

I use NeoDesk CLI. I did run into a little problem. Every time I copied a file to disk, I got the file overwrite message and I did not want to change the option in NeoDesk to automatically overwrite files.

I solved the problem by deleting all the files on the floppy disk before starting to copy the files from the hard drive to the floppy disk. I do not believe this deletion is dangerous, because I am using the grandfather copy of my backup when making a new backup. This deletion of the floppy disk will remove delete hard drive files from the floppy disk backup.

To play it safe, you should have one or more generations of backup. I do my backup once a week on Sunday. Therefore, I use two different disk sets—one labeled ODD and the other labeled EVEN. If Sunday falls on a numerically even date, I use the EVEN disk, otherwise I use the ODD disk. This way, I always have a backup disk if something goes wrong. It is really your own judgement how often to back up your files.

I also created a PAUSE command in the BAT file to ask if I had the correct disk in the floppy drive. I then ran into the second problem—files I could not isolate into separate folders. I took care of this problem with a wildcard on the copy command.

The NeoDesk CLI BAT file I use:

```
ECHO "PUT THE CORRECT BACKUP
DISK IN DRIVE A:"
PAUSE
ECHO
ECHO "DELETE THE FOLLOWING
FILES:"
ECHO
DEL A:\*.*
ECHO
ECHO "COPING THE FOLLOWING
FILES:"
ECHO
ECHO "COPYING D:\BASETWO"
COPY D:\BASETWO\HOUSEIMP.TWO
A:
ECHO
ECHO "COPYING D:\OPUS\*.OPS"
COPY D:\OPUS\BUDGET88.OPS A:
COPY D:\OPUS\EDISON.OPS A:
ECHO
ECHO "COPYING
D:STW\KOAS\*.*"
COPY D:\STW\KOAS\*.* A:
ECHO
echo "COPYING
D:STW\SCAT\*.*"
COPY D:\STW\SCAT\*.* A:
ECHO
ECHO "COPYING D:\*.WKS"
COPY D:\*.WKS A:
ECHO
ECHO "COPYING
G:BASIC.3_0\SOURCE\*.*"
COPY G:\BASIC.3_0\SOURCE\*.*
A:
ECHO
ECHO "COPYING D:\WP\DOC\*.*"
COPY D:\WP\DOC\*.* A:
CLOSE
```

MONSTER DRIVE
Return of the Sequel

Tim Sullivan (CACE MI)

One fine July morning I found myself temporarily unemployed and needed something to do. I picked up an Atari-related magazine and started flipping through the pages.

As I was scanning articles I didn't bother reading initially and paying more attention to some of the advertisements, a thought hit me. "Wouldn't it be nice to have a Hard Drive?"

So, having no job and a basically empty VISA card with no way to make payments on it, I decided to do the only non-sensible thing: To order a hard drive! Now, the only problem was, which one?

Eventually, I decided on a SyQuest-based system. I didn't want to limit myself to just 20 MB or even just 30 MB. A removable cartridge system that provided 44.39 MB per cartridge seemed like the logical step. It was obvious. This would allow unlimited off-line storage to a certain extent. This extent being my willingness to spend the extra $75 to $100 for each cartridge. I called Carter Graphics and Computers in Utah, got some quick information about the ad I read and went with it.

In early August, I received a huge box. I felt like a seven-year-old kid at Christmas! I tore into that box like there was no tomorrow. There was a separate box that the "Shoebox" configuration drive was in; the cartridge, documentation, software and cables were packaged in clear and pink-tinted bags.

I put the drive up next to the computer and began reading the instructions for hook up and initial start up.

The cartridge was already formatted, partitioned and had about 40 MB of PD software installed on it! I hooked up the power cable and went back to get the DMA cable. I rummaged through the styrofoam popcorn-filled box to no avail.

No DMA Cable!!! Almost immediately, I felt the venom seething between my teeth.

I called Carter Graphics and left a message on their answering machine. I now regret the tone of voice and sarcasm I used to convey my disappointment over the matter, but it worked. About an hour or so later, Mr. Carter called and informed me that the cable would be at my door by 10 AM the next morning. He wasn't kidding. It was about the only time I wasn't angry to be roused at such an 'un-godly' hour.

I connected the cable, fired up the drive, inserted the cartridge, waited for it to spin up and turned on my ST. Nothing happened. I checked the indicator lights on the front of the Hard Drive. Both green and amber lights were on steadily.

I checked the error codes. Nothing about both lights being on like that. Hmmm. Naturally, I hit the system reset. Again nothing. A general feeling of dismay overcame me. Now what? I try to eject the cartridge. It won't. Is there something wrong with my ST? Is it the 2 MB memory upgrade responsible?

Nervously, I began to memorize the Trouble Shooting instructions. Everything basically pointed out that the cartridge might not be formatted. I then inserted the SupraDrive Hard Disk Utilities disk into Drive A: and booted up. I decided to try to access one of the drive partitions that appeared on the screen just in case I was wrong. Same old thing: Nothing.

I ran the formatting software when an interesting thing occurred—a DMA error. It said something along the lines of 'Device Not Present'. Now I was really worried that it was my ST at fault.

I went over to my cousin Rod's to make sure. Connected everything up to his ST to see what would happen. Same thing. We tried everything.

He looked over the manuals and suggested we take a look inside. After double-checking the manuals for possible warranty violations for opening the case, we proceeded. We looked at the jumpers to see if the drive was indeed, factory pre-set. We couldn't tell. Checked all the power connections and the Supra Host Adaptor.

We came to this conclusion: A simultaneous shrugging of the shoulders.

Another call to Carter's was of no revelation. Any suggestion he gave me was met with an 'Already tried that, etc.' He said "Send it back and we'll take a look at it." Fair enough.

About three weeks later I grew impatient and called again. He said the jumpers were not set at the factory and that the drive was sent out a few days ago. A week later, I got the drive back. I set it up again and went at it. It booted!

I couldn't believe it! Seeing all those HD partition icons on the screen was the most beautiful sight I have seen! The sound it made as it was loading was, indeed, 'unique' as Gregg Anderson described it in the Sept. '90 issue of AIM.

The drive was populated with all kinds of PD software. Even to this date I haven't completely gone over everything. I've blown away stuff that was either obsolete or of no use to me, but, being the pack-rat I am, I haven't done this to a lot of stuff that might someday be useful (almost 25 MB worth). <SIGH> Oh well.

Soon after I got the drive back in operational order, I began seeing articles about the SyQuest drives for the ST and some other systems much like Gregg's 'Invasion of the Monster Drive' in last year's September issue.

They were pretty much geared towards the Fixed Drive back-up system. I haven't seen a review about a SyQuest being used for primary system use and storage, the reason I bought mine. I was bound and determined that I would write such an article when the time presented itself (which is considerably difficult because of school, work, bar and board crashing).

This Drive is terrific! It is about as fast as a fixed drive. About 31ms seek time and about a 499K/second transfer rate. This is with six oddly-formatted partitions with none having the same size. Generally the smaller the partitions, the better performance you'll get. I've had no real problems that can't be overcome with the Supra Host Adaptor.

It came with a clock, which is something I've desperately wanted and needed ever since I got my ST back in 1987. The drive is wired so I can add either a fixed drive or another SyQuest. If I ever decided to change system platforms, this drive will work perfectly with an IBM or MAC. For you people out there that are into IBM or MAC emulation, you could have a cartridge dedicated to either and not have to worry about having just a dedicated partition on a fixed drive.

I can't just keep going on about how great the drive is without listing some of the quirks I've discovered. For instance, when I wanted to just boot up a game from floppy disk, I don't need the HD on, so it is shut down. Nothing happens. Apparently, the system doesn't like having something connected to the DMA port that isn't active. I've been told this is a by-product of having a Supra Host Adaptor, although I haven't called Supra to confirm this. *[Ed: The SyQuest we use—from ABCO—has an ICD Host Adaptor and the drive can be off and the computer still boots.]*

I've gotten around that. I keep the HD on without a cartridge loaded. No problem, works fine. The way I've had my system set up, everything except the computer, monitor and sometimes the printer comes on at the flip of my power strip. I can make the system 'user-protected' by having the HD shut down! This is especially nice if you don't want anyone to use the computer. (HEHEHEH!)

I also didn't like the way I'd have to boot the system. Turn on HD, insert cartridge then turn on computer after spin-up. I'd always have to hit the reset button after powering up the computer to get the HD to boot. I've also gotten around that. I insert the cartridge before turning the HD on. When I turn on the computer, the HD boots up! I've been doing this for several months without a problem.

I've enjoyed the system despite my initial problems. Carter Graphics & Computers has been nothing but polite, courteous and extremely helpful to me. Now that I have the drive, there is no way I could survive using my system without it! Really! So, if you are looking for a hard drive that can do everything, a SyQuest beastie is the way to go!

California Dreaming

Gary Klugman (SVACE)

Now that the Christmas season is over, all the sales figures are in and the craziness is over, I have a little time for some California Dreaming.

Were there marketing opportunities lost? What if I woke up one day and found out that I was one of the long lost sons of Jack Tramiel? First, of course, I would thank the people that raised me.

Second, I would be sure my "new" dad met my kids to assure their college educations. Finally, I would take my position as an executive of the family business. With that comes the house in the hills and a sports car.

I would try to become vicepresident of computer marketing. I have some special thoughts on the computer market in the US. It is my belief that, while the ST is showing some age, it is still very marketable.

The TT doesn't have a ghost of a chance in the US business market, especially at the over $3,000 price. I would try to get the ST into the US home. My idea is that when people are used to the operating system, it has a chance to be accepted in other places.

I would be as clever and ruthless as my new dad was with the C-64. I would increase production and produce them at a new, incredibly low price. I would sell them through any mass method possible.

Yes, I know that would anger the existing Atari stores, but how many of them are there? Besides, I would hope they would see the opportunity in the after market sales and service. They would also have an opportunity to sell upgrade machines. What opportunities do they have now?

The price would be so low as to barely break even after advertising. My European sales, and sales of other electronic products, would keep money coming in to the company.

The advertising would be aimed at the giant home game industry. It would go something like this, "Why just teach your kid to kill gorillas, when he might actually learn something useful?"

The TV spot would picture a blurry-eyed kid playing an obnoxious game when the parents are watching. Then it would show the same kid with an ST, using it for homework, when the parents aren't looking. There would be other spots aimed at adults as well as kids.

When people are familiar with the company and the operating system, they will become open to other uses. Enter the Mega STE, and the TT. The second phase of the campaign (business is war, remember?) would be launched after there is a large number of ST users. We would then need to launch a campaign for the business and educational users. Of course, profits would soar.

If there just isn't the money for this venture, or the family just wouldn't try this gamble, I would follow a different route.

I would let the ST line in the US float with as little cost as possible. As long as it was profitable, I would continue to sell it in the US. If it became unprofitable, I would quietly drop it and continue my efforts in Europe. I don't see any halfway fixes as anything other than throwing money away.

Time to wake up! I have it on reliable source that Jack Tramiel is not my long lost father. My thoughts on marketing will have about the same effect on Atari as will a field mouse in Idaho.

Actually, I am a consumer. So what are my thoughts? As long as there is a strong market in Europe, third party developers here can still make money if they market here and there. Europeans can also market their products here. That alone will keep us going.

Perhaps someone will come on board at Atari that is a better marketer than I or anyone else at Atari. Perhaps the Tramiels will sell the company to someone that can market computers better.

No matter, I will happily use my fully-functional computer for years to come. I have a backlog of software whose potential I haven't even explored.

ATARI 8-BIT

SOFTWARE - PARTS AND BOOKS FOR ATARI XL / XE & 800/400 COMPUTERS
